SECURE SYNOPSIS

MAINS 2019

GS-III

MAY 2019

General Studies Paper - III

Topic: Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment. Inclusive growth and issues arising from it.

Q) Priority Sector Lending in Agriculture is often seen to be negatively correlated to the climatic conditions of a region. Critically analyse the statement in the backdrop of a recent move of the Banks that decided not to extend loans to regions hit by drought in India. (250 words)

The hindu

Why this question:

Recently Bank of Maharashtra, a state-run lender, has decided not to extend loans in eight zones in Maharashtra and Madhya Pradesh which are hit by drought. Thus it becomes necessary for us to analyse the correlation of droughts and priority sector lending in agriculture.

Key demand of the question:

Analyse in detail the negative correlation of climatic conditions of a region with that of lending by Banks to the farmers.

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In a few introductory lines explain the context of the question.

Body:

In brief discuss –

- Explain Priority Sector Lending (Agriculture)? – Priority Sector includes the following categories: (i) Agriculture, (ii) Micro, Small and Medium Enterprises, (iii) Export Credit, (iv) Education, (v) Housing, (vi) Social Infrastructure, (vii) Renewable Energy and (viii) Others. The activities covered under Agriculture are classified under three sub-categories viz. Farm credit, Agriculture infrastructure and Ancillary activities.
- Why Banks are defying the lending to drought hit regions? – Bad loans from agricultural advances in the branches of such zones, present pathetic condition of agriculture owing to water distress etc.
- Explain why is there a negative correlation? What are its impact ?
- What should be the remedial action?

Conclusion:

Conclude with what needs to be done to address the situation.

Introduction:

- Priority Sector Lending (PSL) is an important role given by the Reserve Bank of India (RBI) to the banks for providing a specified portion of the bank lending to few specific sectors like agriculture and allied activities, micro and small enterprises, poor people for housing, students for education and other low income groups and weaker sections. This is essentially meant for an all round development of the economy as opposed to focusing only on the financial sector.
- Recently Bank of Maharashtra, a state-run lender, has decided not to extend loans in eight zones in Maharashtra and Madhya Pradesh which are hit by drought.

Body:

Priority sector lending norms:

- Currently, all domestic and foreign banks with at least 20 branches are required to lend a minimum of 40 per cent of their total loans (Adjusted Net Bank Credit (ANBC) or credit equivalent amount of off-balance sheet exposure (whichever is higher)) to the priority sector (agriculture, micro enterprises, education, social housing, etc).

- They are also required to meet sub-targets, such as 18 per cent for agriculture (8 per cent for small and marginal farmers), 7.5 per cent for micro enterprises and 10 per cent for weaker sections.
- Those with less than 20 branches will also need to fulfil the overall PSL norms of 40% of adjusted net bank credit (ANBC) in a phased manner by 2020

PSL norms are often seen negatively by banks because:

- It diverts funds from the productive sectors, imposes economic burdens on the banks in the form of loan losses and payment defaults and also imposes opportunity costs of lending to non-priority sectors of the economy.
- These negative effects are increased transaction costs, increased NPAs and the decreased deposit mobilization. Since the subsidized nature of loans under the directed credit forces the banks to pay lower interest rates on deposits, this makes the deposits a less attractive avenue for the people which ultimately impact the banks.
- **Agriculture and credit risk:**
 - Problem with priority sector loans is the lack of understanding of the sub-sectoral target groups, especially agriculture and the small and medium sector, as also weaker sections.
 - Further, given the vagaries of the monsoon that agriculture is susceptible to and the undiversified risk portfolios in such rural areas, the credit risks for such banks from such PSL would be extremely high.
 - The guidelines for agricultural credit and lending to weaker sections are extremely complex the commercial banks may not be the best equipped to handle beneficiary identification, credit risk assessment and loan disbursement to these sectors.
 - Same would be the case for PSL to the micro, small and medium enterprise (MSME) sector. The sector, with its unorganized operations and lack of proper accounting records and financial statements, poses higher costs and greater risks in credit disbursement.

PSL norms are needed because:

- Those who are directly affected comprises of mainly weaker sections of society like farmers and small scale industries.
- PSL was created to ensure support for sectors of the economy that do not receive adequate credit or support from financial institutions due to questions of profitability.
- It is also claimed that PSL results in social returns and improved lending portfolios of the banks.
- The directed lending promotes social equity and facilitates increase in employment and investment in less developed regions and the vulnerable sections of the society.
- Average PSL ratio overall is well above the target over the entire period, with some degree of variation. However, the average lending to agriculture and weaker sections is much below the RBI target. All banks have defaulted on their sub-sectoral targets, especially that of 18% for agriculture, in most years.
- Priority sector loans have contributed far less to the gross non-performing assets (NPAs) .priority sector lending may not be responsible for compromising banks' credit risk minimization strategies, or risk accumulation.
- Removal of existing loan limits of up to ₹5 crore to micro and small units and up to ₹10 crore to medium enterprises, will help banks make good the shortfall in MSME loans that qualify as priority sector lending.

Way forward:

- Banks should be allowed to choose the category they wish to lend to. Foreign banks may then choose to lend in the form of export credit rather than to agriculture.
- Creation of a development finance institution that would provide a mix of grants and loans to under-served sectors and geographies.
- The new institution can raise capital from commercial banks through existing innovative instruments like the PSL certificates, specify minimum sectoral disbursement targets and choose projects based on independent risk assessment and intended outcomes.
- This will support the policy objectives of increased credit and reduce systemic risk, making PSL work in the long run
- Similarly, private sector banks may choose to lend housing credit in urban areas, rather than being forced to lend agricultural finance.
- The government may rely on specialized institutions such as the National Bank for Agriculture and Rural Development (NABARD) to fulfil sectoral lending targets, while at the same time ensuring structural reforms in these sectors to make lending to them more viable.

Q) What do you understand by currency swap ? Discuss the pros and cons of currency swap and explain how it acts as a tool for quantitative easing of the Indian economy ? (250 words)

[Livemint](#)

Why this question:

The question is in the light of recent move of RBI of the currency swap. The article discusses in detail as to how the central bank is using swaps as an indirect tool to loosen monetary policy, and in what ways it could result in an inflationary spurt later.

Key demand of the question:

The answer must provide for a detailed narration of the concept of currency swap, pros and cons and how it functions as a tool of quantitative easing with reference to the recent step taken by Reserve bank of India.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

Shortly narrate the context of the question.

Body:

Answers must discuss the following aspects :

- In brief define what you understand by currency swap – A currency swap between two countries is an agreement or contract to exchange currencies (of the two countries or any hard currency) with predetermined terms and conditions. Often the popular form of currency swap is between two central banks
- How does currency swap between countries work? – A currency swap is similar to an interest rate swap, except that in a currency swap, there is often an exchange of principal, while in an interest rate swap, the principal does not change hands. In currency swap, on the trade date, the counter parties exchange notional amounts in the two currencies.
- What is the advantage of currency swap? – help mitigate the risk of unwanted interest rate fluctuations. For example, It may be more expensive to borrow in the United States than it is in Japan, or vice versa. In either circumstance, the domestic company has a competitive advantage in taking out loans from its home country. Its cost of capital is lower.
- Context of India's currency swap – Under the current swap auction, RBI will buy US dollars from banks totaling to \$5 billion. Minimum bid size would be \$25 million and in multiples of \$1 million thereafter.
- Discuss and list down the benefits and issues associated, take cues from the article.

Conclusion –

Conclude with way forward and state how the RBI's latest move is in line with its easy monetary policy stance.

Introduction:

- A bilateral currency swap is an **open-ended credit line from one country to another at a fixed exchange rate**. The country which avails itself of this loan pays interest to the country which provides it, at a benchmark interest rate such as the Libor (London Inter-bank rate).
- India has such arrangements with many Asian nations, but the arrangement with Japan is among the largest of such deals, valued at \$75 billion. The government hopes that this deal will act as a buffer to shore up the rupee, which has depreciated by 14 per cent against the dollar recently.

Body:

Pros of Currency Swap:

- The currency swap makes it easier to improve liquidity conditions.
- Currency swap agreements help in saving for a rainy day when the economy is not looking in good shape.
- The swap agreements also contribute towards stabilising the country's balance of payments (BoP) position.
- The agreement aids in improving confidence in the Indian market.
- The agreement will aid in bringing greater stability to foreign exchange and capital markets in India

- This facility will enable the agreed amount of foreign capital being available to India for use as and when need arises.
- Currency swaps can be done in multiple ways. If the amount that is being exchanged is fully exchanged when the transaction is initiated, at the maturity date the exchange is being reversed. The idea behind this is that in the meantime, until the maturity date, the market may reverse, thus the brokerage house managed the risk.

Cons of Currency Swap:

- There is one main disadvantage to currency swaps, and this is related to their original purpose.
- At first, they were agreements to get around exchange controls, but then after these barriers were eliminated, they are being used mainly to hedge investments.
- The risk when using a currency swap is that at the time the maturity is being reached, the floating interest rate would represent a bigger cost than the whole purpose of the swap. To mitigate this downside, longer term periods are favoured.

Currency Swap as a tool for quantitative easing:

- **Quantitative Easing** consists of large-scale asset purchases by central banks, usually of long-maturity government debt but also of private assets, such as corporate debt or asset-backed securities. Typically, QE occurs in unconventional circumstances, when short-term nominal interest rates are very low, zero or even negative.
- In recent times, the rupee has been falling against the dollar because of its widening current account deficit (the difference between imports and exports of goods and services).
- This leads to importers upping their demand for dollars far beyond what exporters bring into the country.
- While the RBI had amassed foreign currency reserves of over \$426 billion by April 2018, it has had to use up some of this in recent weeks to prop up the rupee.
- Though present forex reserves at over \$390 billion are still comfortable, having a \$75-billion loan-on-demand from Japan gives the RBI an additional buffer to fall back on, should it need extra dollars.
- The rupee has depreciated the most among Asian currencies amid emerging market volatility triggered by rising US interest rates, pricier crude, geopolitical concerns and intensifying protectionism and trade wars.
- It has fallen over 13% since start of 2018, having recovered from 74.48 to the dollar earlier this month to close at 73.41.
- The arrangement will be used only when required, and will help meet short-term liquidity mismatches.
- India has taken several steps to contain its current account deficit, which could swell to an estimated 2.8% of GDP, and is seen as the root cause of rupee volatility.

Conclusion:

- All in all, currency swaps present more advantages than disadvantages and forex brokers are using them as a valuable risk management tool. Used together with other risk management tools like hedging, they help forex brokers navigate through difficult financial periods.

Q) Despite issues concerning convergence, the WTO needs to be sustained as an international platform to formulate trade rules and bring convergence on divergent matters. Comment. (250 words)

The hindu

Why this question:

India is to host the second mini-ministerial meet of the World Trade Organization (WTO), on May 13-14, 2019. The article is in the backdrop of interests of developing and least developed countries in global trade.

Key demand of the question:

One is expected to analyse in detail the issues of convergence at the WTO between the developed and the developing countries. And what needs to be done to overcome it.

Directive word:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In a few introductory lines explain the background of the context of the question.

**Body:**

In brief discuss –

- Discuss the issues concerning WTO ? – investment facilitation, rules for e-commerce, gender equality and subsidy on fisheries etc.
- Explain why is there a deadlock between group of countries at the WTO?
- Discuss the need for negotiating these issues in a convergent manner.
- Take hints from the article and form a balanced opinion on the issue.

Conclusion:

Conclude that the WTO needs to be sustained as countries need an international platform to formulate trade rules and bring convergence on divergent matters.

Introduction:

- India will host the second mini-ministerial meet of the World Trade Organisation (WTO), on May 13-14, 2019. To discuss the interests of developing and least developed countries in global trade, this informal meet will also focus on the accusation by the U.S. that these economies benefit from exemptions meant for the poorer nations.

Body:**The issues concerning WTO:**

- **WTO is facing existential crisis** during a time when developed economies have adopted protectionist attitude.
- Inability of WTO to bring together the developed and developing countries to build consensus on Doha Agenda.
- Growing tension between developing countries who want to address “legacy issues” and inequalities, and developed countries move to new issues like e-commerce and investment facilitation
- **Agreement on Agriculture:**
 - The disagreements between developed countries (the European Union and the U.S.) and developing countries (Malaysia, Brazil and India) to discipline the farm regime in their favour continue, thereby threatening the WTO’s comprehensive development agenda.
 - At the 11th Ministerial Conference of WTO, the US blocked a permanent solution on government stockholding for food security purposes, India and developing countries toughened its stand on new issues including e-commerce and investment facilitation for digital trade.
- **Politicisation of the Appellate Body appointment and reappointment process:**
 - The quasi-attribution of permanent Appellate Body seats to the U.S. and the European Union (EU).
- **The “Overreaching” or judicial activism of United States:**
 - USA has systematically blocked the filling of vacancies for ‘judges’ to the seven-member AB, it has acutely affected the functioning of the body, even as disputes continue to pile up.
 - The US stand will **adversely affect the development interest of the developing world.**
 - At the **Buenos Aires**, the developed countries led by the US and the European Union formed **groups on e-commerce, investment facilitation and MSMEs** within the WTO with more than 70 members in each group.
- **Non-tariff Barriers:**
 - Developed countries design and implement stringent non-tariff measures (NTMs) which exacerbate the problems faced by poor countries that are willing to export. NTMs significantly add to the cost of trading.
 - However, the costs of acquiescence with many NTMs are asymmetrical across exporters because compliance depends on production facilities, technical know-how and infrastructure — factors that are usually inadequate in developing economies.
 - These countries are, therefore, unable to compete in international markets and hardly gain from sectors with comparative advantage such as agriculture, textiles and apparels.
- **Trade:**
 - There is a trade war between US and China despite both being a member of WTO. This negates the core non-discriminatory principle of WTO.
 - US and China have imposed counter-productive duties, accusing each other of harming their domestic interests. WTO has not been able to prevent the trade wars despite best efforts and has been labelled as a talk shop.

The need for negotiating these issues in a convergent manner:

- Multilateral agreements within the WTO framework have far-reaching implications on global trade unlike bilateral deals.
- The economies of the developing and less developed world (with little bargaining power) were unable to gain market access in most of the developed economies (which were influential in negotiations), especially when it came to agricultural commodities.
- Outside the WTO system, weaker countries will be disadvantaged.
- Regionalism cannot be an alternative. Regional trade groups have succeeded in some places and they have not elsewhere.
- India's own experience with bilateral trade agreements has not always been good.
- The world therefore benefits from a multilateral trade body –though a fairer one than the WTO of the 1990's.
- A weakened EU and Britain need a robust multilateral system

Way forward:

- WTO needs to reinvent itself, focusing on issues where consensus can be built.
- WTO needs to strengthen the dispute settlement mechanism as there are issues in appointment of judges in new appellate body.
- WTO needs to enhance discussion mechanism by introducing wider consultations. It has been a long-standing complaint by the smaller participants that the consultations or decision making is limited to the green room of DG of WTO.
- There is a need of free trade is required more by developing countries like India than developed countries.
- There is need for the structural reform in the WTO functioning as multilateral trading system. Despite WTO being a democratic organization, there is a need to make it more effective in protecting the interests of small nations against stronger countries.
- Transforming the global trading system WTO so that it could promote shared prosperity among all the countries.
- The much wanted need around the world is structural transformation which is a jobs-and-development-focused digital industrialisation strategy
- Development and inclusiveness must remain at the heart of WTO's work.

Conclusion:

- **The Delhi meeting** can be a breakthrough if members negotiate these issues in a convergent manner. The time is opportune for developing countries to voice their concerns and push for a stable and transparent environment for multilateral trade.
- India must do its homework to focus on the unresolved issues and address the newer ones which are of interest to developed nations, mainly investment facilitation.
- The WTO needs to be sustained as countries need an international platform to formulate trade rules and bring convergence on divergent matters.

Q) What do you understand by Banking correspondents? Highlight the advantages of Business/Banking correspondents with special reference to the role they can play in meeting the goal of financial inclusion. Also Discuss the issues being faced by them in the realization of financial inclusion. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The Article highlights that the Business correspondents (BCs) operating in the Direct Benefit Transfer (DBT) scheme and other banking services are finding it tough to operate due to reduction in fees and unaffordability of the Aadhar enabled payment system (AEPS).

Key demand of the question:

The answer must provide for a detailed narration of who is a Business correspondents (BCs) in the Banking system? role played by BC in ensuring financial inclusion of all sections of the society.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines about the banking/Business correspondent.

Body:

Answers must discuss the following aspects :

- Who are they? Business correspondents are retail agents engaged by banks for providing services at locations other than a bank branch or an ATM.
- Permitted services include: identification of borrowers, collection and preliminary processing of loan applications, collection of small value deposit, disbursement of small value credit, sale of micro insurance, MF products and pension products.
- History: In 2006, RBI issued guidelines for engagement of BCs by banks for providing banking and financial services.
- Who can act as BCs? The RBI has provided a long list of entities and persons who can act as BCs.
 - Some of these are NGOs/ MFIs set up under Indian Societies/ Trust Acts (excluding non banking financial companies (NBFCs)), Societies registered under mutually aided co-op. societies (MACs) Act or the Coop. Acts of States, Section 25 companies, Post Offices, Individual kirana/ medical/fair price shop owners etc.
 - In June 2018, Union government announced that all 2.9 lakh common service centres (CSCs) in the country will operate as business correspondents of banks.

Conclusion –

Conclude with way forward.

Introduction:

- Banking Correspondents (BCs) are individuals/entities engaged by a bank in India (commercial banks, Regional Rural Banks (RRBs) and Local Area Banks (LABs)) for providing banking services in unbanked / under-banked geographical territories. A banking correspondent works as an agent of the bank and substitutes for the brick and mortar branch of the bank. He is an approved bank agent providing basic banking service using a micro ATM.

Body:

BCs and Financial Inclusion:

- identification of borrowers;
- collection and preliminary processing of loan applications including verification of primary information/data;
- creating awareness about savings and other products and education and advice on managing money and debt counselling;
- processing and submission of applications to banks;
- promoting, nurturing and monitoring of Self Help Groups/ Joint Liability Groups/Credit Groups/others;
- post-sanction monitoring;
- follow-up for recovery; disbursement of small value credit; recovery of principal / collection of interest
- collection of small value deposits
- sale of micro insurance/ mutual fund products/ pension products/ other third party products and
- Receipt and delivery of small value remittances/ other payment instruments.
- BCs lower the costs of serving the poor. They address many of the behavioural constraints believed to adversely affect savings.
- BCs, who reside in the vicinity of their clients and are often from the same community, can more easily address constraints specific to regions.
- Many of the poor who live in small villages at some distance from the larger villages and small towns in which bank branches are located can now access banking services with the help of BCs.

So far, more than 22 crore bank accounts have been opened under the scheme, utilizing a network of more than one lakh business correspondents (BCs). However, it is widely believed that many accounts were opened in response to political pressure on banks to achieve programme targets. Others may have been opened to avail of the insurance benefits that the accounts enabled or under the expectation that government transfers would require a savings account. As a consequence, duplicate accounts with zero balances represent a high percentage of the total accounts.

Issues faced by BCs:

- **Financial Viability:** The sustainability of the BC model is dependent on the volume of transactions. These volumes are extremely low and are also struggling to make a profit as the current commission structure is inadequate to cover agents' costs.
- **Cash Management and Liquidity:** The most prominent problems faced by the agents are related to cash management and liquidity issues. BCs typically transfer as much money to agents as the security deposit paid by them. However, there are typically large gaps between deposit and withdrawals due to location specific characteristics, such as rural areas being withdrawal heavy due to incoming remittances.
- **Operational Issues:** Agents have reported issues with the base branch claiming branch officials restrict agents to opening only 5 accounts per day and even simple requests to display account numbers on cards given to clients take months to be processed. Technical glitches faced by agents also hinder BC work, ranging from improper functioning of the bank server to other software glitches.
- **Agent inactivity and lack of knowledge about the product:** Clients complain that the agent in charge of collecting their deposits never visited them. In other areas accounts were opened but no agents were appointed for the clients. Poor services or lack of information about the account and its features as the primary reason for inactivity.
- **Standardization and Documentation:** There is a lack of systematic documentation of processes that all agents should follow irrespective of the BC and/or principal bank that they operate with

Way forward:

- There should also be greater clarity with regards to the **cost sharing for cash management** and associated risks between the banks and BCs.
- Banks should be encouraged to let their BCs offer a more diverse product mix to increase revenue. If possible, utility bill payment facilities and other value added linkages should also be introduced along with Non-frill Accounts.
- **A certain level of financial literacy** is necessary to make this model a success. The government, the RBI and principal banks should spearhead the implementation in order to make the BC model profitable.
- The RBI and principal banks should invest time and effort in **promoting** the BC model and its benefits. The RBI should also place a greater effort and emphasis on building acceptance of the BC model amongst its prospective account holders.
- **Standardization** would build a uniformity of roles and responsibilities among agents.

Conclusion:

- Apex institutions such as the RBI and principal banks need to set guidelines to promote risk-sharing between BCs and banks, which is the basis of most of the current issues brought up in this post. The RBI must acknowledge that this model is sustainable, but only in the long run with mass penetration and high transaction volumes.

Q) What are NBFCs ? How are they different from banks ? Discuss their financial activities and the issues currently being faced by the Indian NBFCs. (250 words)

[Livemint](#)

Why this question:

The article highlights the ripple effect of the NBFCs crisis on the Indian economy. Non-banking financial companies (NBFCs) are facing a crisis, particularly the smaller ones that are struggling with asset-liability mismatch amid corporate governance issues. Thus, it is important for us to ponder on the topic from exam point of view.

Key demand of the question:

The answer must provide for a detailed discussion on what are NBFCs, their role and activities in the economy, what are the issues currently they are facing and what needs to be done to resolve it.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines defining what are NBFCs – is a Company that offers financial assistance and other banking services without actually being a bank. It is a Company registered under the Companies Act, 1956.

Body:

Answers must discuss the following aspects:

- What are the characteristics of NBFC? How are they different from Banks?
- Business they undertake? – Loans and advances, Acquisition of shares/stocks/bonds/debentures/securities, Leasing, Hire-purchase, Insurance business, and Chit business.
- Further, Companies whose primary business constitutes receiving deposits either in instalments or lump sum in any manner are also deemed as NBFCs. However, NBFCs exclude institutions engaged in the following kinds of business: Agriculture activity, Industrial activity, Purchase or sale of any goods (other than securities) or Providing any services and sale/purchase/construction of immovable property.
- Discuss How are NBFCs different from banks?
- Then move on to discussing the problems of the NBFCs – asset-liability mismatch amid corporate governance issues, NBFCs had borrowed short term from banks and mutual funds while lending to developers of long-term projects, which got held up because of various factors, willful corporate defaulters etc.
- Suggest solutions – take cues from the article.

Conclusion –

Conclude with way forward.

Introduction:

- A **Non-Banking Financial Company (NBFC)** is a company registered under the **Companies Act, 1956** engaged in the business of loans and advances, acquisition of shares/ stocks/ bonds/ debentures/ securities issued by Government or local authority or other marketable securities of a like nature, leasing, hire-purchase, insurance business, chit business.
- However, it does not include any institution whose principal business is that of agriculture activity, industrial activity, purchase or sale of any goods (other than securities) or providing any services and sale/purchase/construction of immovable property.

Body:

Comparison between NBFC and Banks:

NBFCs lend and make investments, and hence their activities are similar to that of banks; however, there are a few differences as given below:

- NBFC cannot accept demand deposits;
- NBFCs do not form part of the payment and settlement system and cannot issue cheques drawn on itself.
- Deposit insurance facility of Deposit Insurance and Credit Guarantee Corporation is not available to depositors of NBFCs, unlike in case of banks.
- Unlike Banks which are regulated by the RBI, the NBFCs are regulated by multiple regulators; Insurance Companies- IRDA, Merchant Banks- SEBI, Micro Finance Institutions- State Government, RBI and NABARD.
- The norm of Public Sector Lending does not apply to NBFCs.
- The Cash Reserve Requirement also does not apply to NBFCs.

Role of NBFC in Indian economy:

- **Profitability :**
 - NBFCs are more profitable than the banking sector because of lower costs. This helps them offer cheaper loans to customers. As a result, NBFCs' credit growth is higher than that of the banking sector with more customers opting for NBFCs.

- **Infrastructure Lending :**
 - NBFCs contribute largely to the economy by lending to infrastructure projects, which are very important to a developing country like India. Since they require large amount of funds, and earn profits only over a longer time-frame, these are riskier projects and deters banks from lending
- **Promoting inclusive growth :**
 - NBFCs cater to a wide variety of customers both in urban and rural areas. They finance projects of small-scale companies, which is important for the growth in rural areas. They also provide small-ticket loans for affordable housing projects. All these help promote inclusive growth in the country.
- **Variety of sectors:**
 - NBFCs are beginning to meet the consequent unmet demand for credit across a variety of sectors and ensuring continuing credit flows to the real economy.
- NBFCs have been maintaining low net NPA ratios of 3.5% unlike their banking sector counterparts.
- NBFCs have been found to be relatively more resilient to stress applied for credit risk as observed by the RBI in its financial stability reports of the past two years. NBFCs, even under severe stress conditions, continued to remain stable.
- NBFCs have been able to complement the credit intermediation by banks by serving regions, sectors and customer segments that banks have either been unable or unwilling to serve profitably.
- NBFCs often take lead role in providing innovative financial services to Micro, Small, and Medium Enterprises (MSMEs) most suitable to their business requirements.
- NBFCs do play a critical role in participating in the development of an economy by providing a fillip to transportation, employment generation, wealth creation, bank credit in rural segments and to support financially weaker sections of the society.
- Emergency services like financial assistance and guidance is also provided to the customers in the matters pertaining to insurance.

NBFC's aid economic development in the following ways

- Mobilization of Resources – It converts savings into investments
- Capital Formation – Aids to increase capital stock of a company
- Provision of Long-term Credit and specialised Credit
- Aid in Employment Generation
- Help in development of Financial Markets
- Helps in Attracting Foreign Grants
- Helps in Breaking Vicious Circle of Poverty by serving as government's instrument

Issues faced by NBFCs:

- NBFC is passing through a turbulent period following a series of defaults by Infrastructure Leasing and Financial Services (IL&FS) and the subsequent liquidity crunch.
- Several corporates, mutual funds and insurance companies had invested in short-term instruments such as commercial papers (CPs) and non-convertible debentures (NCDs) of the IL&FS group that has been defaulting on payments since August.
- This has stoked fears that many of them could have funds stuck in IL&FS debt instruments which, in turn could lead to a liquidity crunch in their own backyard.
- There are rising fears that the funding cost for NBFCs will zoom and result in a sharp decline in their margins.
- Higher borrowing costs and narrowing options to raise funds will pose challenges for retail non banking finance companies (NBFCs) in the fiscal year ending March 2019 .
- The bond yields have gone up sharply to around the 8% mark. That is making borrowing costlier even at the short end of the yield curve.
- NBFCs are likely to witness higher pricing pressure as competition in the retail segment intensifies going forward this is expected to be accentuated by narrowing funding avenues and higher systemic rates.
- Higher fuel prices, weaker dollar and the trade war could hit the SME sector badly. This would mean defaults by SMES, which have been a traditional market for NBFC lending.
- Investors are worried about a credit downgrade backlash on NBFCs. That could mean huge write-offs for investors.
- Mutual funds who have invested in market instruments of NBFCs have faced increased redemption pressures.

**Way forward:**

- Given the growing size and dominance of the NBFC sector, it is important that the threshold capital levels for entry be substantially increased. It may be prudent for RBI to evaluate the need to shore up minimum capital requirements for various NBFCs.
- While RBI has identified systemically important NBFCs, it needs to step up the monitoring of NBFCs which belong to large, diversified groups. Checks and balances are needed to ensure that risks do not build up in the sector due to structures which are too-complex-to-manage.
- RBI could consider re-visiting some of the unimplemented recommendations of the Working Group on Issues and Concerns in the NBFC Sector chaired by Usha Thorat in 2011.
- One such recommendation was the introduction of a liquidity coverage ratio for NBFCs. The objective was to ensure that NBFCs have cash balances and holdings of government securities which may fully cover gaps between cumulative outflows and cumulative inflows for the first 30 days. This would be the buffer in times of stress.

Q) What are key functions and Principles of Budgeting in India? How far has India evolved in refining its budgetary processes? Elucidate. (250 words)

Indian Polity by Lakshmikanth

Why this question:

The question is straightforward and aims to analyse the evolution of budgetary process in India and functions and key principles of budgeting in India.

Key demand of the question:

Analyse in detail the key functions and Principles of Budgeting in India and its evolution.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines comment on the significance and uniqueness of the Budgetary process in India.

Body:

In brief discuss –

- Discuss the historical evolution of budgetary process in India since the British times.
- Discuss the key functions of a government budget – Public Policy Document, Instrument of Economic Development, public policy document, Instrument of Budgetary Control, Instrument of Accountability etc.
- What are the important principles like – principle of annularity, rule of lapse, fiscal discipline, inclusiveness, accuracy etc.
- Reassert the significance in development and growth of the country

Conclusion:

Conclude with reassertion of importance of such processes.

Introduction:

- A budget is a statement containing a forecast of revenues and expenditures for a period of time, usually a year. It is a comprehensive plan of action designed to achieve the policy objectives set by the government for the coming year. Under **Article 112** of the Indian Constitution, a statement of estimated receipts and expenditure of the government of India has to be laid before parliament in respect of every financial year which runs from 1st April to 31st March.

Body:

Key functions of Budgeting in India:

- **Forecasting:** this entails making a calculated attempt into knowing what the future holds. Forecasting may not be perfect as evidence has shown but it is better to have a forecast to work with than not having any as this will help you get prepared.
- **Planning:** planning depends on forecast that has been made in the past to make decision about the future. The estimated data generated by forecasting are used to make plans. Government agencies, for example

health authorities use forecast from estimated population to plan on the number of health centers to open in a community and the number of beds and other health equipment that will be put in that hospital.

- **Management:** Budgeting is an executive or managerial function. As an effective tool of management, budgeting involves planning, coordination, control, evaluation, reporting and review. Many of the budgetary innovations such as: functional classification, performance measurement through norms and standards, accounting classification to correspond to functional classification, costing and performance audit and use of quantitative techniques.
- **Control:** Control essentially implies a hierarchy of responsibility, embracing the entire range of executive agencies, for the money collected and expenditure, within the framework of overall accountability to the legislature. In a democracy, control assumes new dimensions and gives rise to exceedingly difficult problems.
- **Public Policy Document:** The budget serves as a public policy document expressed in money and is an embodiment of implied policy objective in monetary terms.
- **Redistribution of Wealth:** The most important function of budget is redistribution of wealth. However, that needs proper integration of revenue and expenditure side.
- **Instrument of accountability:** Budget is an instrument to make elected legislators accountable to people. It also upholds the economic, social and cultural rights of the people.

Principles of Budgeting in India:

- **Principle of Annuality:** This implies that a budget is prepared every year on annual basis. Annuality in budget formation is a widespread phenomena. In some countries of OECD, yearly budgets are now framed within a multi-year framework.
- **Rule of Lapse:** Principle of Annuality also implies that the money left unspent in a year must also lapse to the public treasury and government should not be able to spend it unless it is re-sanctioned in next year's budget. This is called Rule of Lapse and is useful as an effective tool of financial control.
- **Fiscal Discipline:** Budget should be balanced and should be able to display congruence between the income and expenditure. This is known as Fiscal Discipline and it adheres to the Keynesian School of Thought. Fiscal discipline helps to eliminate fiscal deficits and offset fiscal surplus.
- **Inclusiveness:** Budget should be comprehensive and inclusive of diverse budget estimates. An inclusive budget includes all government revenue and expenditures and helps evaluating the much required trade-offs between different policy options.
- **Accuracy:** Budget figures are essentially predictions of the amount of money to be generated in the forthcoming year and its expenditure.
- **Transparency and Accountability:** Budget transparency and accountability are two of the eight basic indicators of good governance as propounded by United Nations.

Evolution of Budgeting:

- Broadly, the evolution of budgeting has passed through three stages.
- Firstly, the budgeting system was a sub-system of the British administration. The financial objectives were subordinate to the limited objectives of the colonial power. Control of expenditure and accountability were the hallmarks of this period.
- Secondly, with the attainment of Independence, the developmental priorities of the nation superseded the limited objectives of the British Raj.
- In the third phase, a planning- orientation has been sought to be imparted to the budgetary exercises.
- These three phases correspond to the systems known as **incremental budgeting, performance budgeting and zero base budgeting respectively.**

Conclusion:

- The budget is an expression of the government's public policy. It informs the public as to how the government plans to earn and sell. But, most importantly, the budget reflects the government's balance sheet. In a large democracy like India, budgets take on a life of their own as it has a widespread impact on numerous areas. Hence, it is imperative to have knowledge about what it stands for and its importance.

Q) Why cannot an outgoing government present a full budget? Discuss the issues involved and need for clear guidelines on this also elaborate on the utility of an Interim budget in such a scenario. (250 words)

Indian Polity by Lakshmikanth

Why this question:

The question is to evaluate the method of Interim budget – its need, functionality and procedure. Also, one has to discuss the utility of Interim budget.

Key demand of the question:

Analyse in detail the features of an Interim budget, how is it different from a full budget? what are the nuances of it.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines explain that Conventionally, a government at the end of its term goes in for a vote on account rather than a full Budget. Therefore, the debate on the issue. While few favor the full budget, others oppose it on the ground that this is an election year and the government has already presented 5 full budgets.

Body:

In brief discuss –

- Discuss the procedure of budget – role of Article 266, 114 of the constitution.
- What is vote on account? Why is it presented?
- Interim budget? – An Interim Budget is not the same as a 'Vote on Account'. While a 'Vote on Account' deals only with the expenditure side of the government's budget, an Interim Budget is a complete set of accounts, including both expenditure and receipts. An Interim Budget gives the complete financial statement, very similar to a full Budget.
- Compare and contrast the full budget with that of an interim budget.
- Discuss measures/ solutions required in direction to resolve and overcome the present controversies.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- Traditionally, in an election year, the outgoing government presents **an interim budget or so-called vote on account**. The interim budget, or Vote on Account, is only for three/four months before the new government presents a full-fledged budget in July.
- The outgoing government cannot present an economic survey, bring a finance Bill or introduce new services during in the interim budget and doing so will be unconstitutional. Although, several governments, including the Congress-led United Progressive Alliance in 2009, haven't shied away from making policy pronouncements in interim budgets.

Body:

Issues involved in Budget during election year:

- The budget involves altering both taxes and outlays on schemes, this could influence the voters in an election year and goes against the principle of free and fair elections.
- **Constitutionally, the government can make tax changes in the interim budget.** However, the 12 interim budgets since Independence have respected the fact that the government is a custodian for a few months and have refrained from announcing big-ticket changes or new schemes
- With the general elections due, the ruling government would look at making available cheap loans and free accidental insurance to small businesses.
- While an incoming government has the freedom to change the estimates in the interim budget when it presents the final budget after taking office, outgoing governments in India have generally followed the convention of avoiding major policy announcements or taxation proposals in the interim budget.
- Going by recent history, however, interim budgets have been passed thrice since 2000.

- There is also the matter of the Presidential address to the Budget Session whereby the government makes its vision statement.
- If the budget proposes populist schemes, it will become difficult for the new government if it is led by another political party to withdraw these.

Utility of Interim Budget:

- The budget for the year approved by Parliament gives the government spending rights only till the end of the financial year ending March 31.
- If for any reason the government is not able to present a full budget before the financial year ends, it will need parliamentary authority for incurring expenditure in the new fiscal year until a full Budget is presented.
- Through the interim Budget, Parliament passes a vote-on-account that allows the government to meet the expenses of the administration until the new Parliament considers and passes the Budget for the whole year.
- In an election situation, the vote-on-account is usually for a four-month period.
- In an interim Budget, the vote-on-account seeks parliament's nod for incurring expenditure for part of a fiscal year.
- However, the estimates are presented for the entire year, as is the case with the regular Budget.
- However, the incoming government has full freedom to change the estimates completely when the final Budget is presented.

Conclusion:

- Thus, there needs to be proper codes laid down in the constitution regarding the kind of budget and the extent to which the government of the day use its power in the interim budget.

Q) Explain the concepts of budgetary deficit and fiscal deficit. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

The question is from the static portions of GS – III paper and is intended to evaluate the concepts of budgetary deficit and fiscal deficit.

Key demand of the question:

Analyse in detail the concepts of budgetary deficit and fiscal deficit.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Provide for a brief introduction of the two concepts or highlight their significance.

Body:

In brief discuss –

- Definition of the two – budgetary deficit and fiscal deficit.
- What is difference between fiscal deficit and budget deficit? – Budgetary deficit is the difference between all receipts and expenses in both revenue and capital account of the government.
- A fiscal deficit occurs when a government's total expenditures exceed the revenue that it generates, excluding money from borrowings. Deficit differs from debt, which is an accumulation of yearly deficits.
- Discuss the significance of the two in the economy.

Conclusion:

Conclude by reasserting their significance.

Introduction:

- **Budgetary deficit** is the difference between all receipts and expenses in both revenue and capital account of the government and indicate the financial health of a country. A **fiscal deficit** occurs when a government's total expenditures exceed the revenue that it generates, excluding money from borrowings.

Body:

Budgetary deficit:

- The government generally uses the term budget deficit when referring to spending rather than businesses or individuals. Accrued deficits form national debt.

- A budget deficit happens when current expenses exceed the amount of income received through standard operations.
- Certain unanticipated events and policies may cause budget deficits.
- Countries can counter budget deficits by raising taxes and cutting spending.

Danger of Budget Deficits

- One of the primary dangers of a budget deficit is inflation, which is the continuous increase of price levels.
- Ultimately, a recession will occur, which represents a decline in economic activity that lasts for at least six months.
- Continued budget deficits can lead to inflationary monetary policies, year after year.

Strategies to Reduce Budget Deficits

- Countries can counter budget deficits by promoting economic growth through fiscal policies, such as reducing government spending and increasing taxes.
- For example, one strategy is to reduce regulations and lower corporate taxes to improve business confidence and increase Treasury inflows from taxes.
- A nation can print additional currency to cover payments on debts issuing securities, such as Treasury bills and bonds. While this provides a mechanism to make payments, it does carry the risk of devaluing the nation's currency, which can lead to hyperinflation.

Fiscal Deficit:

- The difference between total revenue and total expenditure of the government is termed as fiscal deficit.
- It is an indication of the total borrowings needed by the government.
- Generally fiscal deficit takes place either due to revenue deficit or a major hike in capital expenditure.
- Capital expenditure is incurred to create long-term assets such as factories, buildings and other development.

Challenges posed by Fiscal Deficit:

- It can mean that the Government is spending money on unproductive programmes which do not increase economic productivity. (For example MNREGA, most of the money is eaten midway by the Sarpanch and Local officers.)
- As government borrows from RBI which meets this demand by printing of more currency notes (called deficit financing), it results in circulation of more money. This may cause **inflationary pressure in the economy**.
- When Government keeps borrowing and borrowing to fill up the fiscal deficit pothole, then bond yield will increase. It is not good because more and more of taxpayers' money (i.e. Government 's incoming money) will go in repaying that bond interest rate rather than going into education or healthcare.
- Government may be compelled to borrow to finance even interest payment leading to emergence of a **vicious circle and debt trap**.
- Fiscal deficit "Crowds out" investment from private sector as Government borrows most of the cash.
- Borrowing is in fact financial burden on future generation to pay loan and interest amount which retards growth of economy.

Strategies to Reduce Fiscal Deficit:

- A deficit is usually financed through borrowing from either the central bank of the country or raising money from capital markets by issuing different instruments like treasury bills and bonds.
- A drastic reduction in expenditure on major subsidies. Reduction in expenditure on bonus, LTC, leaves encashment, etc. Austerity steps to curtail non-plan expenditure.
- Tax base should be broadened and concessions and reduction in taxes should be curtailed. Tax evasion should be effectively checked. More emphasis on direct taxes to increase revenue. Restructuring and sale of shares in public sector units.
- Famous economist John Maynard Keynes opined that deficits actually assist nations in climbing out of economic recessions.
- However, fiscal conservatives believe that deficits should be avoided by the government which should be inclined towards a balanced budget policy.

Conclusion:

- Thus, both the measures gives an indication of the health of the economy. It helps to guide the macro-economic policies of the Government for better usage of the public finances.

Q) Discuss in detail the crisis being faced by NBFCs in India? Suggest what measures need to be taken to resolve the same? (250 words)

[Indianexpress](#)

Why this question:

The article highlights the ripple effect of the NBFCs crisis on the Indian economy. Non-banking financial companies (NBFCs) are facing a crisis, it brings out the urgency with which RBI needs to urgently address the liquidity issues plaguing the NBFC sector.

Demand of the question:

The answer must explain what are NBFCs, their role and activities in the economy, what are the issues currently they are facing and what needs to be done to resolve it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

The answer to the question is direct, one must explain in detail the issues being faced by NBFCs and what measures are needed to tackle the same.

The article captures both the dimensions, the students must take hints and structure the answer in detail.

Conclusion:

Conclude with what should be the way ahead.

Introduction:

- A **Non-Banking Financial Company (NBFC)** is a company registered under the **Companies Act, 1956** engaged in the business of loans and advances, acquisition of shares/ stocks/ bonds/ debentures/ securities issued by Government or local authority or other marketable securities of a like nature, leasing, hire-purchase, insurance business, chit business.
- However, it does not include any institution whose principal business is that of agriculture activity, industrial activity, purchase or sale of any goods (other than securities) or providing any services and sale/purchase/construction of immovable property.

Body:

How the NBFC crisis has panned out

Aug 2018: IL&FS crisis becomes public. With a debt of ₹91,000 crore, it defaults several times in Sep.

Sep: Crisis leads to sell-off in shares of several NBFCs. This leads to redemption pressure on many MF schemes.

Jan 2019: Essel Group's debt troubles become public. MFs and NBFCs enter into a "standstill agreement" with the promoter family to not sell the pledged shares of Zee Entertainment Enterprises.

Feb: Reliance group and its lenders and MFs enters into an Essel-like pact.

Apr: CARE Ratings downgrades debt programme of Reliance Capital and two of its arms, Reliance Commercial Finance and Reliance Home Finance.

May: Icra downgrades ratings on long-term bonds of Yes Bank with a negative outlook.

NBFC crisis:

- NBFC is passing through a turbulent period following a **series of defaults by Infrastructure Leasing and Financial Services (IL&FS)** and the **subsequent liquidity crunch**.
- Several corporates, mutual funds and insurance companies had invested in short-term instruments such as commercial papers (CPs) and non-convertible debentures (NCDs) of the IL&FS group that has been defaulting on payments since August.

- This has stoked fears that many of them could have funds stuck in IL&FS debt instruments which, in turn could lead to a liquidity crunch in their own backyard.
- There are rising fears that the funding cost for NBFCs will zoom and result in a sharp decline in their margins.
- Higher borrowing costs and narrowing options to raise funds will pose challenges for retail non banking finance companies (NBFCs) in the fiscal year ending March 2019.
- The bond yields have gone up sharply to around the 8% mark. That is making borrowing costlier even at the short end of the yield curve.
- NBFCs are likely to witness higher pricing pressure as competition in the retail segment intensifies going forward this is expected to be accentuated by narrowing funding avenues and higher systemic rates.
- Higher fuel prices, weaker dollar and the trade war could hit the SME sector badly. This would mean defaults by SMES, which have been a traditional market for NBFC lending.
- Investors are worried about a credit downgrade backlash on NBFCs. That could mean huge write-offs for investors.
- Mutual funds who have invested in market instruments of NBFCs have faced increased redemption pressures.
- A kind of contagion then spread to other financial stocks, and the benchmark indices crashed, creating wider impacts.
- Following the credit crunch after IL&FS crisis, RBI provided special incentives to banks to enable the flow of funds to NBFCs.

Way forward:

- Given the growing size and dominance of the NBFC sector, it is important that the threshold capital levels for entry be substantially increased. It may be prudent for RBI to evaluate the need to shore up minimum capital requirements for various NBFCs.
- While RBI has identified systemically important NBFCs, it needs to step up the monitoring of NBFCs which belong to large, diversified groups. Checks and balances are needed to ensure that risks do not build up in the sector due to structures which are too-complex-to-manage.
- RBI could consider re-visiting some of the unimplemented recommendations of the Working Group on Issues and Concerns in the NBFC Sector chaired by Usha Thorat in 2011.
- One such recommendation was the introduction of a liquidity coverage ratio for NBFCs. The objective was to ensure that NBFCs have cash balances and holdings of government securities which may fully cover gaps between cumulative outflows and cumulative inflows for the first 30 days. This would be the buffer in times of stress.

Q) What do you understand by Green New Deal (GND)? Evaluate its prospects for India's ailing economy. (250 words)

[livemint](https://www.insightsias.com/livemint)

Why this question:

The question is around the concept of Green new deal and the prospects it has for Indian economy.

Key demand of the question:

The answer must discuss what is the concept of GND, its prospects and way forward.

Directive word:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer

Introduction:

write a few introductory lines on the importance of such concept.

Body:

Answer should have the following dimensions covered:

- Discuss the concept of Green New Deal – It is a big, bold transformation of the economy to tackle the twin crises of inequality and climate change. It would mobilize vast public resources to help us transition from an economy built on exploitation and fossil fuels to one driven by dignified work and clean energy.
- Explain What is the Green New Deal proposal?
- Discuss how The Green New Deal could work in India too, allowing for a qualitative difference to the economy.

- Take hints from the article and discuss at depth.

Conclusion –

Conclude with significance and what should be the way forward.

Introduction:

- Green New Deal (GND) is a set of **proposed economic stimulus programs in the United States that aim to address climate change and economic inequality**. The GND “is a **four-part programme for moving America quickly out of crisis into a secure, sustainable future**”.
- The name refers to the **New Deal, a set of social and economic reforms and public works projects** undertaken by President Franklin D. Roosevelt in response to the Great Depression. It combines **Roosevelt’s economic approach** with modern ideas such as **renewable energy and resource efficiency**.

What Is the Green New Deal?

A **45 percent** cut in carbon emissions by 2030 could keep global warming to **2.7°F**. Here’s how to save the planet and create jobs:

1 What works for the environment...

2 ...can also work for the economy.

THE Nation.

Sources: Data for Progress; IPCC
2018 Infographic: Tracy Matsue Loeffelholz

Body:

It includes **seven goals** previously introduced by Ocasio-Cortez:

- Shift 100 percent of national power generation to renewable sources.
- Build a national energy-efficient “smart” grid.
- Upgrade all buildings to become energy efficient.
- De-carbonize manufacturing and agricultural industries.
- De-carbonize, repair, and upgrade the nation’s infrastructure, especially transportation.
- Fund massive investment in the drawdown and capture of greenhouse gases.
- Adopting these goals would make “green” technology, industry, expertise, products, and services a major U.S. export.

GND and India:

- There are two main reasons why GND might find ready acceptance in India.
- One, it meets India’s push to reduce the country’s carbon footprint and stack up large capacities in renewable energy generation.
- Two, public sector’s importance in the GND blueprint aligns with ruling party’s social-democrat tilt in economic policy.

GND's prospects for India's ailing economy:

- GND might work in India too, with some modifications to fit in with Indian conditions.

The three main targets of GND stand out: **decarbonization** (accelerated electrification of vehicles is one way), **jobs creation** (which converts GND mainly into an economic transformation policy and less of an environment policy) and **protection for those hit hardest by the transition**.

- **Economic Impact:**
 - Businesses can create a profitable competitive advantage by adopting Green New Deal goals.
 - States have already set goals to become carbon-free.
 - The Green New Deal funds new jobs, including installing solar panels, retrofitting coastal infrastructure, and manufacturing electric vehicles. It asks for new trade rules to stop “the transfer of jobs and pollution overseas.”
 - It recognises that public funds would be needed for these changes and need to be leveraged.
- **Infrastructure:**
 - The resolution requires that any new infrastructure spending must address climate change.
 - It wants the government to push for more zero-emissions vehicles and invest in high-speed rail and other public transit.

Way forward:

- GND has found tremendous support among the youth in the US which has been participating in mass political action to not only push for legislation but to also shake up an inert political class in denial about global warming and climate change.
- A pan-US youth movement called the **Sunrise Movement** is trying to forge a consensus in the Democratic Party to support GND.
- Student politics in India motivates multiple voices to either immediately ask why students should get involved in politics, or provide unwarranted advice on how students should focus only on studies (actually exams) and not get distracted by politics.
- However, most college students are eligible to vote. Therefore, asking them to make a judgement call on politics at the municipal, state and national level but to block their political instincts once they enter the campus is asking for a compartmentalized personality.
- The political expression of issues that affect them, like global warming or climate change must be expressed.
- India needs its Sunrise moment.

Q) The problem with the Indian economy is not “jobless” growth. It is the inadequacy and instability of incomes for millions. Critically Analyse. (250 words)

[Livemint](#)

Why this question:

The article discusses in detail the prevailing conditions of poverty amidst election promises made by prime Minister Modi stating there will be only two castes now: those who are poor and those who want to free them from poverty.

Key demands of the question:

The answer must analyse why there is poverty in our country and in what way it is not about the jobless growth in the country but about the instability in the incomes of the people.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

In a few introductory lines explain the conditions of poverty in the country.

Body

The body of the answer has to capture the following aspects:

- Discuss what you understand by jobless growth.
- How is it related to poverty in India?
- What makes Indian economy prone to jobless growth? what are the implications?

- How is it not about joblessness but about income instability?
- Take hints from the article to elaborate and conclude with significance.

Conclusion

Conclude with way forward.

Introduction:

- A significant percentage of India's poor are, in fact, employed even though they might not have regular jobs. With unemployment turning out to be a big challenge for the government currently, and rural areas in distress due to agriculture's all-time-low economic returns, India has started debating employment seriously.

Body:

- **Jobless growth:** In a jobless growth economy, unemployment remains stubbornly high even as the economy grows. This tends to happen when a relatively large number of people have lost their jobs, and the ensuing recovery is insufficient to absorb the unemployed, under-employed, and those first entering the workforce.

Jobless growth and poverty:

- Problem is, our discussions usually centre around two solutions: **create jobs through government spending on infrastructure and take up skill development that would offer some employability to the youth.** Add to it the disproportionate focus on economic growth leading to job creation. These strategies are age-old, and are not in sync with job market characteristics. We have a high youth unemployment rate, and those who are employed are not able to lead a decent life.
- 39 per cent of young workers in emerging and developing countries live in moderate and or extreme poverty. This means surviving on less than US \$3.10/day. Worse, in emerging and developing countries, 16.7 per cent of young workers live on income below the extreme poverty threshold of US \$1.90/day. (**Global Employment Trends for Youth 2018 by the International Labour Organization (ILO)**).
- In developing countries, **95 per cent of employed youth are in informal sectors.** In another discouraging trend, the ILO report says that youths are three times as likely as adults to be unemployed. "Globally, the ratio of youth to adult unemployment rates has changed very little in recent years, serving to illustrate the particularly disadvantaged situation of young people in the labour market."
- According to the **Fifth Annual Employment-Unemployment Survey, 2015-16**, with an increase in education levels across India, the unemployment rate has also risen in the age group of 18-29 years.
- India's employment is found primarily in informal sectors; a substantial percentage of it comes from daily wages in development projects and agriculture.
- Their earnings are uncertain, and with very little wealth to fall back on, they easily slip back into poverty. This is the plight of small farmers, small entrepreneurs and workers in the informal sector of India.

Measures needed:

- The most important is provision of **universal social security.** In a dynamic, market-based economy, in which enterprises will wax and wane and jobs will be insecure, citizens must have adequate social security to provide for various emergent requirements, especially breaks in income, health emergencies, and old-age pensions.
- The **political economy must be reformed** with stronger associations at the bottom, such as **collectives of small producers and unions of workers.**
- Collectives can provide resources that individual enterprises cannot afford, and associations and unions can give more bargaining power to people at the bottom to improve the terms of trade in their favour—the prices they get, and the wages they are paid.
- **Laws applying to small enterprises must be simplified** and their implementation made easier. The burden of complicated and badly administered regulations is highest for small enterprises.
- **Labour laws and regulations are necessary, and their content improved and implementation eased.** They must be reformed for faster and more inclusive growth.
- **Small enterprises provide more employment than large ones and will continue to provide most jobs and incomes in the economy.**
- Access to finance, access to markets, access to technology, fair prices, and reduction of harassment from authorities are their principal problems. They must be tackled.

Conclusion:

- Informal employment shouldn't be equated with non-job status. Rather, the strategy should be to maximise decent job creation in these sectors.
- When we talk about skill development, we usually don't consider the skills being employed in informal sectors by workers as legitimate skills. Instead, we tend to force them into a new set of skills that they have to start with afresh.

- This might lengthen the process of job creation and employment. To sum up, we need to think anew about the way we create jobs.

Q) “With the New government India needs a New Bombay Plan”. Elucidate. (250 words)

[Livemint](#)

Why this question:

The article is in the backdrop of the new government that has come into place and places the need for new Bombay plan for the Indian economy.

Key demand of the question:

The answer must discuss the relevance of Bombay plan for the present economy and the nuances of the same.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief write up on what was Bombay plan

Body:

Discussion should include the following aspects –

- Explain what was Bombay plan? How is it relevant even today?
- Discuss its potential to change the direction of economic development in the country and how it also happens to be one that is worth emulating today.
- Explain why it is necessary for the new government to have a vision in this direction?

Conclusion:

Conclude with significance of such plans in bringing an overhaul in the economy of the country.

Introduction:

- The Bombay Plan is the name commonly given to a World War II-era set of proposals the development of the post-independence economy of India. The plan, published in 1944/1945 by eight leading Indian industrialists. It proposed state intervention in the economic development of the nation after independence. A key principle of the Bombay Plan was that the economy could not grow without government intervention and regulation.

Body:

Objectives of Bombay Plan:

- The prime objectives of the plan were to achieve a balanced economy and to raise the standard of living of the masses of the population rapidly by doubling the present per capita income within a period of 15 years from the time the plan goes into operation.
- Under the assumption that the fledgling Indian industries would not be able to compete in a free-market economy, the Plan proposed that the future government protect indigenous industries against foreign competition in local markets.
- This plan envisages that the economy could not grow without government intervention and regulation. In other words, the future government protects indigenous industries against foreign competition in local markets.
- Although the Bombay Plan did not itself propose a socialist agenda, “virtually all” commentators acknowledge “that there is a direct line of continuity from the Bombay Plan of 1944-1945 to the First Five-Year Plan in 1950.”

Significance of Bombay Plan for new India:

- Its uniqueness, far-sightedness and focus on the social sector.
- It had even promoted ‘State Capitalism’ (the genesis of the mixed economy) although the concept might have been put there to prepare India for free-market capitalism.
- It was a national plan for long-term economic and social development sought by the leadership of indigenous business in their own interest as well as in the national interest.
- The original Plan underlines the necessity of economic unity. It only happened in 2017 when India introduced a nationwide Goods and Services Tax.

- It had come up with a cascade of priorities where the State's intervention is required – education, public health, agricultural growth, progressive taxation and the need to tackle black money and wealth hoarded abroad.
- The document clearly states that public sector industries should be sold to private investors at some point – disinvestment, in today's parlance.

Conclusion:

- Given the state of India's economy today, with High NPA's, twin-balance sheet problem and reduced investment by the private sector. There is an increased need for Government spending to spur the economy.

Q) "Though cryptocurrency often has been viewed as a disrupter to the traditional notions of currency, it might outlast national currencies as a concept." Critically analyse. (250 words)

[livemint](https://www.livemint.com)

Why this question:

The article provides for a detailed analysis of how cryptocurrencies though have been doubted for long by various countries, it is gaining significance as a currency that can challenge the traditional ones.

Demand of the question:

Answer must discuss in detail the nuances of cryptocurrency. One must trace its evolution from being doubted to the one now that has been gaining significance for known and unknown factors.

Directive word:

Critically analyse – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Start with definition of cryptocurrency.

Body

Discuss the following points in detail:

- What are cryptocurrencies? How are they used?
- Explain how though widely seen as a disruption for the traditional banking and financial institutions, cryptocurrencies have gained significant traction over the last half a decade, at the same time creating a regulatory nightmare for banking regulators across the globe. At present, there are around 969 cryptocurrencies in existence across the globe, with a total market capitalization close to 116 Billion USD.
- Quote reasons for their popularity.
- What are the associated pros and cons?
- What needs to be done?

Conclusion

Conclude with significance and way forward.

Introduction:

- A cryptocurrency is a digital or virtual currency that uses cryptography for security. Cryptocurrencies use decentralized technology to let users make secure payments and store money without the need to use their name or go through a bank. They run on a distributed public ledger called blockchain, which is a record of all transactions updated and held by currency holders. The most common cryptocurrencies are Bitcoin, Ethereum, Ripple, and Litecoin.
- **Facebook** has announced a digital currency called **Libra** that will roll out for use in 2020 and allow the platform's billions of users across the globe to make financial transactions online.

Body:

Current state of Cryptocurrencies:

- Experts and central banks across the world are slowly arriving at the conclusion — written about in various research papers but not yet implemented in policy — that cryptocurrencies are here to stay.
- The world's premier cryptocurrency is within sniffing distance of \$9,000 apiece, and investors still seem bullish on it.

- The current value—at \$8,918 on 29 May—is below its peak of \$19,600-plus in late 2017, which was achieved after an exponential rise all through that year.
- That ascent took online traders by storm and stoked fears of a tulip mania-like “bubble” just before it crashed dramatically; by the end of 2018, it had slid to about one-fifth of its peak value.
- Bitcoin’s market capitalization is now over \$150 billion, reportedly.
- India banned crypto-currencies in 2018, shortly after a Chinese clampdown.

Cryptocurrency is a disrupter to traditional notions of currency:

- The government is wary that regulation will provide legitimacy to “what is currently ambiguous,” and may lead to further rise in its valuation and end up contributing “to the investment bubble”.
- A currency that is not based on any real economic activity, unlike a sovereign currency whose value is based on the relative value of a tradeable basket of goods and services, cannot prima facie inspire much comfort.
- Bitcoin’s value, astronomical even now at about \$8,300 but much below January 2018’s stratospheric levels, is based on demand for a fixed supply of Bitcoins in the future it cannot exceed 21 million in number, of which 18 million has already been mined.
- The security offered by encryption of cryptocurrency may be breached by hackers who are always lurking for any point of weakness. This may end up costing investors huge amounts of money because prices are attached to the currencies.
- Cryptocurrency exists only in essence such that there are no physical coins and notes. As a result, there is, therefore, no central place where the currency can be deposited for safe keeping.
- Lack of regulation of cryptocurrency means it is not under any control or supervision. This attracts more investors thereby increasing their chances of investing in this technology.
- Cryptos are feared not just for their sheer speculative propensities, but also for their capacity to undermine sovereign currencies (the latter is an exaggerated apprehension).
- Virtual currency is being traded anonymously over the Internet and used for a host of anti-national and illegal activities, from terror funding to illicit trade of arms and drugs and so on.
- The online use of this currency, was without any border restrictions or geographical constraints, resulting in danger to the integrity and sovereignty of the nation.
- However, it does not make sense to go overboard and criminalise merely adventurous crypto speculators. There are no official or other data available that point towards misuse of cryptocurrencies for illegal ends

However, there are a few advantages of cryptocurrencies:

- One of the reasons why cryptocurrencies have gained global appeal is because of their secure nature. Cryptocurrencies are encoded into a database.
- Cryptocurrency trading draws its legitimacy from the unanimity of the participants in its network. It has gained global approval by most leaders as a legal medium of payment.
- No transaction fees are usually charged for transactions involving cryptocurrency.
- Cryptocurrency does away with the need for a regulator.
- By making everything public, cryptocurrency negates the need for a middleman.
- According to bitcoin.org, no individual or organisation can manipulate Bitcoins because it is cryptographically secure and do not contain customers’ personal information.

Measures needed:

- Governments the world over have banned cryptocurrencies as a medium of exchange, and India is no exception.
- Yet in India, an estimated 30 lakh Bitcoins are reportedly in circulation. From a value of a little over ₹60,000 at the start of 2017, the Bitcoin now commands a value of nearly ₹6 lakh, with a global market cap of \$10.2 trillion. Cryptos are recognised in the US as an asset class.
- Firms like Paypal, Uber, Visa and Mastercard have all signed up as part of the consortium to control it. Each has invested \$10 million.
- Criminalising possession of cryptocurrencies will impact such investments.
- Bankers and investors now consider the cryptocurrency market at par with derivatives. The NYSE plans Bitcoin futures through a platform called **Bakkt**.

Conclusion:

- Underlying the crypto movement is a libertarian belief: Cryptos are an alternative asset to fiat currencies; controlled by none, they cannot be manipulated by governments with vested interests. Legalising the cryptomarket can help beneficiaries emerge from the shadows and make productive investments in an

economy witnessing a digital transformation. Crypto conduct calls for regulation, but not outright criminalisation.

Q) What do you understand by sandbox which is often mentioned in the context of financial technologies companies ? Discuss its importance to Indian economy. (250 words)

The hindu

Why this question:

Recently the Securities and Exchange Board of India (SEBI) has released a discussion paper on a framework for a 'regulatory sandbox' for fintech testing.

Key demand of the question:

One must explain in detail what is the concept of sandbox, what are its utilities, how is it useful in effective regulations of Fintech companies.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start by bringing out the highlights of the discussion paper brought out by SEBI.

Body:

In brief discuss –

- Highlights of the paper.
- Definition: A live, testing environment where new products, processes, services and business models could be deployed on a limited set of eligible customers for a specified period of time, with certain relaxations in the regulations and guidelines.
- Objective: The sandbox is intended to serve as a testing ground for new business models and technologies that benefit the investors, Indian markets and the Indian economy at large.
- To begin with, all market participants that are registered with the SEBI will be eligible to test within the sandbox. At a later stage, SEBI may allow sandbox access to fintech start-ups and other fintech firms as well.
- To be eligible to be tested in the sandbox, a solution need to show that it directly benefits the investors and poses no risks to the financial markets among other parameters.

Conclusion:

based on your discussion, conclude with significance of such a concept.

Introduction:

- In the computer science world, a sandbox is a **closed testing environment designed for experimenting safely with web or software projects**. The Securities and Exchange Board of India (SEBI) has released a discussion paper on a framework for a 'regulatory sandbox,' wherein companies dealing with financial technologies can test new technologies and products in a live market environment.

Body:

Regulatory Sandbox:

- regulatory sandbox can be defined as a live, testing environment where new products, processes, services and business models could be deployed on a limited set of eligible customers for a specified period of time, with certain relaxations in the regulations and guidelines.
- The concept of regulatory sandbox is used in a similar manner in the digital economy arena: testing grounds for new business models that are not protected by current regulation, or supervised by regulatory institutions.
- The indicative list of products, services and technologies where this concept could be applicable includes retail payments, money transfer services, marketplace lending, mobile technology applications, data analytics and application program interface (API) services

Importance of Regulatory Sandbox for India:

- The sandbox is intended to serve as a testing ground for new business models and technologies that benefit the investors, Indian markets and the Indian economy at large.
- To begin with, all market participants that are registered with the SEBI will be eligible to test within the sandbox.

- At a later stage, SEBI may allow sandbox access to fintech start-ups and other fintech firms as well.
- These testing grounds are especially relevant in the fintech world, where there is a growing need to develop regulatory frameworks for emerging business models.
- The purpose of the sandbox is to adapt compliance with strict financial regulations to the growth and pace of the most innovative companies, in a way that doesn't smother the fintech sector with rules, but also doesn't diminish consumer protection.
- It allows the regulator, the innovators, the financial service providers (as potential deployers of the technology) and the customers (as final users) to conduct field tests to collect evidence on the benefits and risks of new financial innovations, while carefully monitoring and containing their risks.
- Meanwhile, to be eligible to be tested in the sandbox, a solution need to show that it directly benefits the investors and poses no risks to the financial markets among other parameters.

Conclusion:

- A regulatory sandbox would benefit fintech firms by way of reduced time to launch innovative products at a lower cost. This will further improve the financial inclusion in India.

Q) Discuss the need for a robust and transparent securitisation framework in Indian financial systems also discuss measures to develop the market further. (250 words)

Reference

Why this question:

The Reserve Bank of India (RBI) constituted a committee to review the existing state of mortgage securitization in India and suggest measures to deepen it.

Key demands of the question:

The answer must analyse the need for robust and transparent securitization framework in Indian financial systems. Discuss the present issues, causes etc.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

In a few introductory lines define need for securitization framework.

Body

The body of the answer has to capture the following aspects:

- Discuss the Committee on the Development of Housing Finance Securitization Market.
- Explain the details why the committee had to come in place, need for restructuring etc.
- Discuss that The mortgage securitization market in India is primarily dominated by direct assignments among a limited set of market participants on account of various structural factors impacting both the demand and the supply side, as well as certain prudential, legal, tax and accounting issues.
- For a vibrant securitisation market to develop, it is imperative that the market moves to a broader issuance model with suitable structuring of the instruments for diverse investor classes.
- At the same time, as the international experience shows, it is critical to address the issues of misaligned incentives and agency problems resulting from information asymmetry problems between the originators and investors in the market, which can exacerbate systemic risk.
- Thus, a careful design of a robust and transparent securitization framework assumes paramount significance.

Conclusion

Conclude with significance of the same.

Introduction:

- **Securitization** is the process of taking an illiquid asset, or group of assets, and through financial engineering, transforming it (or them) into a security.
- It is a risk management tool used to reduce idiosyncratic risk associated with the default of individual assets. Banks and other financial institutions use securitization to lower their exposure to risk and reduce the size of

their overall balance sheet. RBI recently set up committee for development of housing finance securitisation market.

Body:

- The move is aimed at bringing in standardisation of asset securitisation practices to enable better management of credit and liquidity risks.

Terms of reference:

- To review the existing state of mortgage backed securitisation in India and suggest measures to deepen it.
- To assess the role of various counterparties, including servicers, trustees, rating agencies, in the securitisation process and suggest steps to address the key risks.
- The committee will also study the best international practices, and lessons learnt from the global financial crisis.
- It will propose measures to further develop these markets in India by identifying critical steps required, such as definition of conforming mortgages, mortgage documentation standards, digital registry for ease of due diligence and verification by investors, and avenues for trading in securitised assets.

Need of committee:

- The mortgage securitisation market in India is primarily dominated by direct assignments among a limited set of market participants on account of various structural factors impacting the demand and the supply side, as well as certain prudential, legal, tax and accounting issues.
- The move comes at a time when housing finance companies and NBFCs have been facing higher borrowing costs and slowdown in funding after a liquidity squeeze in the market.
- The RBI noted that globally, residential and commercial mortgages are supported by well-lubricated securitisation markets, under which mortgage originators package portfolios of mortgages and resell them in capital markets as mortgage-backed securities or covered bonds.
- Thus, a careful design of a robust and transparent securitisation framework assumes paramount significance.

Measures needed:

- For a vibrant securitisation market to develop, it is imperative that the market moves to a broader issuance model with suitable structuring of the instruments for diverse investor classes.
- It is critical to address the issues of misaligned incentives and agency problems resulting from information asymmetry problems between the originators and investors in the market, which can exacerbate systemic risk.

Conclusion:

- A well-functioning securitisation markets can enable better management of credit and liquidity risks on the balance sheets of banks as well as non-bank mortgage originators and, in turn, help lower the costs of mortgage finance in the economy. The move is a positive impetus for the sector and will help on the liquidity front.

Q) What do you understand by Outcome budget ? How is it different from performance budget ? Explain. (250 words)

Indian polity by Lakshmikanth

Why this question:

The question is to evaluate – outcome budget, performance budget.

Key demand of the question:

The answer must provide for a detailed discussion on the two type of the budget namely – outcome budget and performance budget, provide for a comparison and contrast the two.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer

Introduction:

write a few introductory lines about the significance of a Budget.

Body:

Answers must discuss the following aspects :

- **What is an Outcome Budget?** – It is a progress card on what various Ministries and Departments have done with the outlays in the previous annual budget. It measures the development

outcomes of all government programs and whether the money has been spent for the purpose it was sanctioned including the outcome of the fund usage.

- It is a means to develop a linkage between the money spent by a government and the results which follow.
- An interesting feature of outcome based budgeting is that the outcomes of programmes are measured not just in terms of Rupees but also in terms of physical units like Kilowatt of energy produced or tonnes of steel produced. Also outcomes are expressed in terms of qualitative targets and achievements to make the technique more comprehensive.
- Then move on to discuss the procedure for outcome-based budgeting.
- **Then explain what is a performance budget?** – A performance budget is a budget that reflects the input of resources and the output of services for each unit of the government. This type of budget is commonly used by government bodies to show the link between taxpayer funds and the outcome of services provided by federal, state, or local governments.
- Provide for merits and demerits of the two.

Conclusion –

Conclude by reasserting their significance.

Introduction:

- Outcome based budgeting is a **practice of suggesting and listing of estimated outcomes of each programmes or schemes designed.**
- Outcomes are the end products and results of various Government initiatives and interventions, including those involving partnership with the State Governments, Public Sector Undertakings, autonomous bodies and the community. Outcome Budget was first introduced in India by the UPA in 2005-06 by stating that “the people of the country are concerned with outcomes, not outlays”.

Body:

Advantages of Outcome Budget:

- Public administration in India has been plagued by a lack of focus on results and outcomes that matter most to citizens.
- Annual planning and monitoring revolves largely around the allocation of the government’s budget to its departments and programmes and periodically checking if the money is being spent and activities completed.
- But such an approach, however, completely misses the difference between doing the job, and doing it well.
- An outcome-based approach shifts the perspective to the short and long-term outcomes of governance.
- For example rather than asking did they build enough toilets or did they open schools and hospitals, the questions will be like whether the toilets built are clean and functional and did open defecation reduce.
- An outcome budget seeks to enshrine this approach within governments by linking budgetary outlays to specific outputs (tangible services or infrastructure provided) and outcomes (short or long-term benefits to the people).
- It arms citizens with data to hold governments accountable, and in turn empowers the governments to better orient the bureaucracy towards results.
- The Centre has since 2005-06 continued to release annual Outcome Budget reports with incremental changes and without any reference to the previous year’s performance.

Disadvantages:

- It is resource intensive. It takes a lot more time and effort to closely review and justify every budget element rather than modify an existing budget and review only new elements.
- Difficulty in matching expenditure with results & performance
- Focusing on process and input utilization, resulted in wasteful expenditure
- Lack of trained staff and those trained are transferred to unrelated jobs

Performance budget:

- **A performance budget** is a budget that reflects the input of resources and the output of services for each unit of an organization. This type of budget is commonly used by government bodies to show the link between taxpayer funds and the outcome of services provided by federal, state, or local governments.

Advantages:

- An increase in accountability of the local authorities to the taxpayers, communication to the public about priorities, and quantifying particular goals.
- Taxpayers want to know where and how their money is being spent and to what end.

- Performance-based budgeting helps in bringing the transparency in the budget preparation. The performance budget helps in taking better financial decisions for the allocation of resources.

Disadvantages:

- A potential for disagreement on where spending priorities should lie, in the case of a government with multiple agencies
- Lack of unified cost standards across multiple agencies
- The potential for a department to manipulate data in order to reach a target, which could lead to a need to spend funds on an independent party to verify results
- A lack of flexibility once the inputs/outputs have been set

Conclusion:

- In India, most of the Central Government Ministries are following outcome budgeting. Delhi Government has presented two outcome budgets till now. The document acts as a progress report of government projects and aims to ensure 'greater transparency' in governance.

TOPIC: Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Q) Write a note on 4th Industrial Revolution. Discuss in detail the possible impact of it on Indian economy. (250 words)

Reference

[Economictimes](https://economictimes.india.com/news/economy/growth/4th-industrial-revolution-what-it-is-how-it-will-affect-india/articleshow/70111117.cms)

Why this question:

The article provides for a detailed analysis on the coming of 4th Industrial Revolution.

Key demand of the question:

Analyse in detail what is 4th Industrial Revolution and what are its impact on Indian economy.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines explain what you understand by 4th Industrial Revolution.

Body:

In brief discuss –

- What is 4th Industrial Revolution (4th IR)? – characterized by a fusion of technologies that is blurring the lines between the physical, digital, and biological spheres.
- There are three reasons why today's transformations represent not merely a prolongation of the Third Industrial Revolution but rather the arrival of a Fourth and distinct one: velocity, scope, and systems impact.
- Discuss its Impact on Indian economy – both negative and positive.
- Positive Impacts:
 - Demographic dividend and Employment generation, Strong Banking sector, Global Leader in Industrial revolution, Investments and exports, Agriculture and Health etc.
- Negative Impacts: Loss of jobs, Competitiveness, Dumping, Loss to MSMEs, Economic inequality, Environmental Externalities etc.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- The **Fourth Industrial Revolution (IR 4.0)** is a term that describes present technological age. It is the fourth industrial era since the inception of the initial Industrial Revolution of the 18th century.
- The key elements of the fourth revolution are the fusion of technologies ranging from the physical, digital to biological spheres. Prime Minister gave an institutional shape to the expression by launching the **Centre for Fourth Industrial Revolution in India**.

Body:

As described by the founder and executive chairman of World Economic Forum, Klaus Schwab, “the fourth industrial revolution is a technological revolution that will fundamentally alter the way we live, work and relate to one another”.

Characteristics of IR 4.0:

- It is characterized by a fusion of technologies that is blurring the lines between the physical, digital, and biological spheres.
- It brings together digital technology and the physical world to create a new range of products and services.
- The possibilities of billions of people connected by mobile devices, with unprecedented processing power, storage capacity, and access to knowledge, are unlimited.
- And these possibilities will be multiplied by emerging technology breakthroughs in fields such as artificial intelligence, robotics, the Internet of Things, autonomous vehicles, 3-D printing, nanotechnology, biotechnology, materials science, energy storage, and quantum computing.
- The revolution is evolving at an exponential rather than a linear pace and it is disrupting almost every industry in every country.

Possible Impact of IR4.0 on Indian Economy:

- For India, the Fourth Industrial Revolution brings tremendous opportunities to leapfrog many stages of development, hastening its journey towards becoming a developed economy.
- It can play a major role in alleviating poverty.
- Better and low-cost health care can be achieved through the implementation of AI-driven diagnostics, personalized treatment, early identification of potential pandemics, and imaging diagnostics, among others.
- Enhancing farmer’s income by providing them with the latest technologies, improvement in crop yield through real-time advisory, advanced detection of pest attacks, and prediction of crop prices to inform sowing practices.
- It will strengthen infrastructure and improve connectivity to the very last village.
- Artificial intelligence can be used to empower and enable specially-abled people.
- It will improve ease of living and ease of doing business using smart technologies.
- Recently, India has announced her drone policy, which will play an important role in security, traffic and mapping.
- Increased automation means more efficient products and processes, faster growth
- It gives a boost for small scale industries as production gets automatic and cheap
- India provides a potentially huge market access.
- There is the very appealing demographic dividend with Indian youth representing approximately 20% of the global workforce by 2020. With more than 50 per cent of its population is under the age of 27, India can play a pivotal role in shaping the global fourth Industrial revolution in a responsible, scalable and inclusive manner.
- There is a rising middle class
- India is expected to become the fifth largest consumer market in two decades. Within this context, any form of consumption, entrepreneurship, startup or industry, can be viewed as a scaling opportunity.
- India also has a robust start-up scene, which reportedly has more firms than anywhere else in the world except for the US and the United Kingdom (UK).

- With one of the youngest labour forces in the world, a sizeable technical aptitude, the second largest number of internet users on mobile devices and the second largest English speaking population, India is well positioned to enhance its global leadership in a post fourth industrial revolution era.

Challenges posed by IR 4.0:

- Stiff competition from other countries, high unemployment levels and high incidences of poverty etc.
- Revolution is likely to increase inequality in India as the spread of machines increases markets and disrupts labour markets.
- Inequality represents the greatest societal concern associated with the Fourth Industrial Revolution.
- The largest beneficiaries of innovation tend to be the providers of intellectual and physical capital the innovators, shareholders, and investors which explains the rising gap in wealth between those dependent on capital versus labour.
- As automation substitutes for labour across the entire economy, the net displacement of workers by machines might exacerbate the gap between returns to capital and returns to labour.
- With this revolution, it is also possible that in the future, talent, more than capital, will represent the critical factor of production. This will give rise to a job market increasingly segregated into low-skill/low-pay and high-skill/high-pay segments, which in turn will lead to an increase in social tensions.
- The Fourth Industrial Revolution will change not only what we do but also who we are. It will affect our identity and all the issues associated with it: our sense of privacy, our notions of ownership, our consumption patterns, the time we devote to work and leisure, and how we develop our careers, cultivate our skills, meet people, and nurture relationships.

Way forward:

- Governments, businesses and civil society organisations should put together an ecosystem for massive upskilling of the workforce.
- India needs to prepare itself for a period of information and digital abundance, adapt itself to the scorching pace of innovation and learn to collaborate on scale, quickly transform the idea into a breakthrough innovation, shift from a system of time-bound education to a mode of continuous learning and create more employment opportunities than what new and disruptive technologies take away.
- There is a need for good quality education to make India's youth a productive asset.
- Access to finance commensurate with maturity of the business model and beginning stage of the start-up lifecycle is extremely important to scale innovations.
- Corporates will have a key role in championing this on-going movement, leveraging the ART Model – Alliances, Relationships enabled through Technology.

Conclusion:

- Industrial Revolution that first began in Great Britain and later in United States (after end of Civil War) has helped nations in developing faster and easier means of mass production. It has transformed lives of people in many ways over about 250 years.
- India is also catching up with focussing on Industrial Revolution 4.0. Development of new technologies in this era can help the nations in many ways if these technologies are used effectively for the welfare of mankind.

Q) Amidst the expected future global financial and economic crisis, Military spending around the world still continues to boom. Discuss the factors driving such a boom, how would continued spending be justified in such an era ? (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article brings to us the findings of the report Stockholm International Peace Research Institute (SIPRI) that finds that the Total world military expenditure rose to \$1,822 billion in 2018, representing an increase of 2.6% from 2017. Thus it is important from exam point of view to analyse the impact of these findings.

Key demand of the question:

The answer must provide for a detailed analysis of the findings and the impact it has on world countries and peace.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines highlight the facts of the report.

Body:

Answers must discuss the following aspects:

- Comment upon the findings of the report, discuss its relevance.
- World military spending in 2018 represented 2.1% of global gross domestic product (GDP) or \$239 per person. In 2018 the USA and China accounted for half of the world's military spending.
- Analyse what is the trend like – discuss how the spending boom is driven, above all, by the contest between America and China for primacy in Asia.
- Discuss the combination of factors that explain the increased military spending:
- Foreign policy objectives
- Real or perceived threats
- Armed conflict and policies to contribute to multilateral peacekeeping operations
- Availability of economic resources – refers to rapidly developing nations like China and India that have seen their economies boom in recent years. In addition, high and rising world market prices for minerals and fossil fuels (at least until recently) have also enabled some nations to spend more on their militaries.
- Conclude with significance of the report and what needs to be done?

Conclusion –

Conclude with way forward.

Introduction:

- According to new data from the SIPRI, total world military expenditure rose to \$1.8 trillion in 2018, representing an increase of 2.6 % from 2017. The five biggest spenders in 2018 were the United States, China, Saudi Arabia, India and France, which together accounted for 60% of global military spending. World military spending in 2018 represented 2.1% of global gross domestic product (GDP) or \$239 per person.

Body:

The factors driving such a boom:

- **Physical and psychological security threats:** These threats are more than just ordinary especially in case of India, a country located in a dangerous neighbourhood and facing both internal and external threats. Example: The West's "alarm" over emerging Chinese and Russian systems
- **Comprehensive national security:** It helps a nation attain its aspirations, and robust security is a subset of that. Military security involves the development of such capability to deter potential adversaries from undertaking inimical activities that may result in forms of adventurism or even proxy interference in a nation's affairs.
- **Potential Military Capability:** A country's defence spending represents the most direct way of measuring its potential military capability. In terms of gauging relative military strength, the size of defence budgets can be compared between countries over a set period of time.
- **Geography:** It is also a factor. Countries in Northern Europe aside from Britain, France and Germany can afford to invest less in their militaries knowing that blocs and alliances such as the EU and NATO will ensure their collective security. That's less true in Saudi Arabia, some say, which faces extremist threats from nearby wars in Syria, Iraq and Afghanistan, and Iranian-backed enemies like Hezbollah in Lebanon and the Houthis in Yemen.

Challenges posed by such extravagant spending:

- The increase would have to be on the capital side of the defence budget.
- Salaries, pensions and other operating expenses have full fund allocation with little scope to absorb extra funds.
- Raising the defence capital expenditure would leave the government with very little money for infrastructure and asset creation.
- As most defence equipment is procured from foreign countries, an increased capital budget would increase the defence import bill, and add to the current account deficit.
- This will require either an increase in the current tax rates, or a widening of the tax base.
- Both are difficult to achieve in the short term.
- It will thus not be feasible to substantially augment government's non-borrowing revenues

Way forward for India:

- The lack of a national security strategy, a national strategic culture and a transformational approach towards its military capability prevent it from obtaining optimum benefit from its defence expenditure.
- Decisions must be timely and procedures for acquisition are fast-tracked. Also, financial support should be sufficient with systems which do not call for a lapse of financial resources, once allotted.
- Management of expenditure also needs a complete revamp. Amid the focus on prevention of potential corruption, limited leakages could still be acceptable if timeliness of delivery is achieved even as more efficient procedures are implemented.
- Optimise the existing defence allocations, rather than seek a quantum jump in funds

Conclusion:

- A country's high expenditures on its military doesn't ensure a perceived high quality of life. The debate regarding how a government should balance military spending and domestic services dates back at least a century. The real issue is what is an "adequate" amount of military spending, given that every extra dollar spent above the necessary level is a clear loss for the economy as a whole. In a democracy, that issue is debated by publicly elected officials and changes year to year.

Q) What are Masala bonds? How do they work? Discuss the rationale behind them along with the pros and cons associated. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The state of Kerala became the first Indian state to tap into the market for masala bonds on Friday. Thus, it is important for us from exam point of view to ascertain into the concept of Masala Bonds.

Key demand of the question:

The answer must discuss in detail the concept of Masala bonds, pros and cons associated with their utility.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines by stating the background of the question.

Body:

Answers must discuss the following aspects :

- What do you understand by Masala Bonds? – “Masala Bonds” are the 10 year off-shore rupee bonds issued by International Finance Corporation (IFC), a member of the World Bank group, in the international capital market in 2014, to raise funds for supporting private sector infrastructure

development initiatives in India. Masala bonds are listed in London Stock Exchange. The term Masala bonds now extends to any rupee denominated bonds issued to overseas buyers even though RBI has not resorted to the use of this name in their guidelines.

- Discuss their rationale – like any other off-shore bonds, are intended for those foreign investors who want to take exposure to Indian assets, yet constrained from doing it directly in the Indian market or prefer to do so from their offshore locations.
- Pros and cons associated – Offshore bonds have its own set of advantages and disadvantages for both the issuer and the investor as well as for the economy. Competition from offshore markets may induce improvements in domestic bonds markets such as strengthening of domestic market infrastructure, improving investor protection and removing tax distortions that hinder domestic market development etc. Against these benefits come the risks associated with financial openness and sudden shifts in capital flows, and the risk that offshore markets may draw liquidity away from the domestic market.

Conclusion –

Conclude by reasserting their importance in raising capital.

Introduction:

- Masala Bonds are rupee-denominated bonds i.e the funds would be raised from overseas market in Indian rupees.
- The term was used by the International Finance Corporation (IFC) to evoke the culture and cuisine of India. The first Masala bond was issued by the World Bank-backed IFC in November 2014. Recently, Kerala (Kerala Infrastructure Investment Fund Board) became the first Indian state to tap into the market for masala bonds to raise development funds.

Body:

Working:

- Any corporate, body corporate and Indian bank is eligible to issue Rupee denominated bonds overseas.
- For example, if an Indian financial entity issues Rs 1000 rupee denominated bond overseas, the buyer in overseas can buy the bond, paying equivalent amount of dollar/sterling.
- If the exchange rate was 1\$ = Rs 50, the bond buyer will pay \$20 (or Rs 1000) to buy the rupee denominated bond.
- Suppose the interest rate is 10%. Here, the Indian entity has to pay Rs 100 annually and this can be paid (in dollars etc.) at the prevailing exchange rate at the payment time.
- Now if the exchange rate depreciates to 1\$ = Rs 75, the bond buyer's interest revenue of Rs 100 equals just around \$1.3. He actually incurs losses in terms of dollars (might have got \$2 if the exchange rate was the same or in the case of dollar denominated bonds).
- Here, if the rupee' value has changed, the risk should be borne by the foreign investor. At the end of the time period, the issuer will give Rs 1000 and this can be converted into dollar at the prevailing exchange rate at that time

Rationale:

- Like any other off-shore bonds, are intended for those foreign investors who want to take exposure to Indian assets, yet constrained from doing it directly in the Indian market or prefer to do so from their offshore locations.

Pros:

- They help to internationalize the Indian Rupee and deepen Indian Financial system by expansion of Indian bond markets.
- They diversify the funding resources of Indian companies.
- They may help to bring down the cost of borrowing and cost of capital.
- Allowing Masala Bonds is considered to be a small step towards full convertibility of Rupee.
- Such bonds would support towards stability of rupee.
- By issuing bonds in rupees, an Indian entity is protected against the risk of currency fluctuation, typically associated with borrowing in foreign currency

Cons:

- RBI mandates that the money raised through such bonds cannot be used for real estate activities other than for development of integrated township or affordable housing projects.
- It also can't be used for investing in capital markets, purchase of land and on-lending to other entities for such activities as stated above.

**Conclusion:**

- India needs almost \$2 trillion for setting up world class infrastructure according to Economic Survey. The rupee-denominated bonds help in raising funds for the capital of infrastructure projects, green-field projects, brown-field projects.

Topic– Inclusive growth and issues arising from it.

Q) Discuss the concept of ‘Gender budgeting’ and analyse its significance in the Indian context. (250 words)

Reference

Why this question:

The question is intended to evaluate the concept of Gender budgeting.

Key demand of the question:

The answer must discuss the importance of Gender Budgeting in the Indian economy, one must narrate in detail the significance of it.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments

Structure of the answer:

Introduction:

In a few introductory lines appreciate the concept of Gender- Budgeting.

Body:

- Explain – Gender Budgeting initiatives aim to integrate gender concerns into fiscal policies and administration to address disparities.
- India formally adopted gender budgeting in 2005 and since then it is listing out ‘Women specific schemes’ and ‘Pro women schemes’ in budget.
- Explain what are the challenges involved in Gender – Budgeting? –
- Women must be given adequate representation and opportunity to voice their concerns in pre-budget consultation.
- Center should encourage states to include gender budgeting in their respective budgets, it is imperative because states get 42% tax devolution.
- According to census 2011 sex ratio is 940 women per 1000 men and women literacy rate is 64%
- Women constitute only 15% highest wage earner in India.
- Global Gender Gap report ranked India 87 in terms of inequality in economy, education, health and political representation.
- Discuss how Gender budgeting plays a significant role in addressing these inequalities and empowering women to achieve equality with men in all spheres of life.

Conclusion:

Conclude with importance of Gender budgeting and how Along with gender budgeting better implementation and planning are needed to ensure that these policies percolate right down to the last woman in the most remote parts of the country.

Introduction:

- Gender budgeting (GB) is a **practice that accounts budgetary measures to support gender commitments**. It is not just an accounting exercise but an ongoing process of keeping a gender perspective in policy/ programme formulation, its implementation and review.
- GB entails dissection of the Government budgets to establish its gender differential impacts and to ensure that gender commitments are translated in to budgetary commitments.

Body:

- Since 2005-06, the Expenditure Division of the Ministry of Finance has been issuing a note on Gender Budgeting as a part of the Budget Circular every year. This GB Statement comprises two parts- Part A and Part B.
- Part A** reflects **Women Specific Schemes**, i.e. those which have 100% allocation for women.
- Part B** reflects **Pro Women Schemes**, i.e. those where at least 30% of the allocation is for women.

Significance in the Indian context:

- **Global Gender Gap report 2018** ranked India 108 in terms of inequality in economy, education, health and political representation.
- The rationale for gender budgeting arises from recognition of the fact that national budgets impact men and women differently through the pattern of resource allocation.
- Women, constitute 48% of India's population, but they lag behind men on many social indicators like health, education, economic opportunities, etc.
- All measures across the globe taken towards development, poverty alleviation and improvement of social indicators like health, education and gender equality are worthless unless policies are implemented specifically for women and girls.
- Women face disparities in access to and control over services and resources.
- Bulk of the public expenditure and policy concerns are in "gender neutral sectors".

Challenges involved in Gender – Budgeting:

- First, there is **limited availability of disaggregated gender-specific data sets** for all schemes and programmes under various ministries. In the absence of this data, it is difficult to study the impact of budgetary allocations on gender equality.
- Second, the **budgeting exercise is linked to schemes instead of outcomes**. For example, in the Budget for 2015-16 there are funds allocated for infrastructure maintenance under the ministry of health and family welfare. However, there is very little data available on the impact these funds made in reducing female mortality rates.
- Third, there is an **immediate need to conduct an assessment of gender-specific parameters and set goals accordingly**. For example, it is important to understand time-bound goals for parameters such as female school enrolment, gender-based violence, health, labour force participation.
- Fourth, **authority should be created for gender auditing, to conduct an annual impact assessment of budgetary allocations for all schemes**, thus bringing accountability to the process.

Way forward:

- There is also a critical need for capacity building across government, corporates, public sector undertakings, NGOs and all involved agencies.
- While steps have been taken to mainstream the gender budgeting process at central and state government level, there is a definite need to deepen this process.
- A national-level reporting platform should be created under the ministry of statistics and programme implementation, which will collect the disaggregated data by sex for understanding the impact and outcome of the gender budgeting initiative.
- The Central Statistics Office should also be engaged for better data collection and analysis techniques.
- Shared responsibility between the central and state governments would accelerate this process.
- There needs to be shift from mere "reporting" of gender allocations to "purposive planning" with wider participation of women.
- The adoption of the GB should be accompanied by multifaceted and interrelated improvements to budgets in general and the gender sensitivity of budgets.

Conclusion:

- Gender Budgeting is a powerful tool for achieving gender mainstreaming so as to ensure that benefits of development reach women as much as men. The way Government budgets allocate resources, has the potential to transform these gender inequalities.

Q) Culture of 'bending rules' in India has repeatedly challenged the U.S. drug agency, in such a circumstance discuss the issues facing the Pharma industry in this direction ? Suggest measures to overcome the same. (250 words)

Livemint

Why this question:

Very recently Several Indian pharmaceutical companies have been accused of collusion to raise generic drug prices in the US. After facing American scrutiny over quality issues, India's pharmaceutical industry has again landed in the crosshairs of US regulatory action. Thus we have to analyse in detail issues surround

**Key demand of the question:**

The answer must discuss in detail the problems facing the pharmaceutical industry in India and the approaches to ensure long term viability.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer**Introduction:**

write a few introductory lines highlighting the issue.

Body:

Answers must discuss the following aspects :

- The answer must examine the Pharmaceutical (Pharma) industry and the changes that have occurred particularly over the last few years as a result of the overall economic downturn, the rising cost of healthcare and the costs associated with the development and sales of pharmaceuticals.
- Explain how the response of big Pharma to this has been the recent spate of partnerships, mergers and acquisitions, consolidation, diversification, licensing agreements and downsizing in both human and capital resources.
- Discuss the Culture of ‘bending rules’ in India and in what way it challenges U.S. drug agency.
- Suggest suitable measures to overcome the issues facing the industry.

Conclusion –

Conclude with way forward.

Introduction:

- India is the largest provider of generic drugs globally with the Indian generics accounting for 20% of global exports in terms of volume.
- In developing countries, India is rendering yeoman service by providing access to lifesaving medicines at affordable prices.
- Recently, several Indian pharmaceutical companies are accused of collusion to raise generic drug prices in the US. If guilty, punish them. But the fairness of the trial will be under watch

Body:**Issue background:**

- Forty-four US states have together sued 20 drugmakers, seven of them Indian, for the alleged fixing of generic drug prices at levels higher than what the market would set.
- Israel's Teva Pharmaceutical Industries, the world's largest producer of generic formulations, allegedly underpins a shadowy cartel designed to exert monopolistic power in the US.
- Fifteen individuals have also been named in the lawsuit filed in a court in Connecticut.
- The complaint alleges that senior executives of the offending companies often met at trade events, conferences, dinners and even golf outings, and kept in touch via phone and email to raise prices and carve up the market among themselves.
- According to the charges, collusion peaked between July 2013 and January 2015, a period when prices of more than 100 generics went up sharply, some by over 1,000%. These allegations are serious and, if proven, could deal a severe blow to Indian drug exporters that count the US as a major market for off-patent drugs.

Issues facing the Pharma industry:

- Because of fewer costs associated with generic medicines, multiple applications for generic drugs are often approved to market a single product; this creates competition in the marketplace globally, typically resulting in lower prices. Pharma sector in India is also facing steep headwinds on account of this.
- There is a lack of proper assessment of the performance of the pharmaceutical industry and its efficiency and productivity and due to this many plants have not survived.
- Unregulated online pharmacies or e-pharmacies emerging in India have been a major concern for authorized setups.

- There has been a significant drop in the flow of prescriptions as the Indian pharmaceutical industry has been witnessing a decline in the overall quality of its medical representatives (MRs). This is mainly on account of lack of training and support by the industry.
- In countries such as Russia, one requires to be a medical graduate to be a pharma sales representative. In the European Union, one needs to pass stringent examinations to become an MR. Once they qualify, they need to renew their certification every three years. But in India, even non-graduates are performing as MRs without proper guidance.

IPR related issues posed a serious threat to our industry, some of them are:

- Granting Compulsory Licences (LCs), although allowed by TRIPS agreement of WTO, western countries are blaming India for disrespecting patents transgressing India's judicial use.
- Emergence of new agreements like TPP, TTIP, RCEP seriously affect our industry without rational dealing on public health.
- Emergence of Voluntary Licence (VL) in agreements place restrictions on reaching the global markets.

Measures needed:

- India's strong innovation capabilities aided partnerships would help in overcoming these problems.
- The introduction of pharmaceutical product patents and the mandatory implementation of good manufacturing practices is the need of the hour.
- It is necessary for the Indian pharmaceutical industry to become globally competitive through world-class manufacturing capabilities, with improved quality and a higher efficiency of production, and there is a need to stress on the up-gradation of R&D capabilities.
- Training and development of human resources for the pharmaceutical industry and drug research and development should be done accordingly;
- There is also a need to promote public-private partnership for the development of the pharmaceuticals industry; promote environmentally sustainable development of the pharmaceutical industry; and enable the availability, accessibility, and affordability of drugs.
- Improvement in industrial practices to provide better training and support services for employees to perform their job functions.

Conclusion:

- The affordability of healthcare is an issue of concern even in India, and people here would welcome some clarity on the principles of fair pricing vis-à-vis medical products. It is important that the accused companies are given a good hearing. The Government of India has taken up a number of initiatives to create an ecosystem that fosters manufacturing in pharma industries.

Topic: Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

Q) "Shift to Horticulture is a Way of Doubling Farmers' Income in India". Discuss along with the achievements of Mission for Integrated Development of Horticulture (MIDH) in this direction. (250 words)

The hindu

Why this question:

The question is intended to evaluate the potential of Horticulture as a standalone sector in India and how it can help double farmer's income and its role in proving to be a source of livelihood in Indian agriculture.

Key demand of the question:

The answer must discuss the importance of horticulture to India in doubling farmer's income along with the achievements of Mission for Integrated Development of Horticulture (MIDH).

Directive word:

Examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

In a few introductory lines provide for current scenario of horticulture in India, provide for statistics – The Indian agricultural land covers area of 140 million hectares out of which, 17% of area is dedicated to horticultural crops that contributes to 30% of total agricultural GDP.

Body:

- The Horticulture is diversified to cover 6 subsectors namely vegetables, fruit crops, spices, ornamentals, plantation crops and mushrooms.
- Discuss how has the horticulture section performed lately in quantitative and qualitative terms? Also, frame the statistics comparing it with the overall agriculture sector.
- How can we increase our produce quality and quantity?
- Discuss the achievements of Mission for Integrated Development of Horticulture (MIDH).

Conclusion:

Conclude with potential of horticulture in India and need to harvest it.

Introduction:

- Within the agriculture sector, the horticulture sector is widely recognised as the most rapidly growing sector. It has been rightly called as the **silent revolution** because of its varied achievements.
- The Indian agricultural land covers area of 140 million hectares out of which, 17% of area is dedicated to horticultural crops that contributes to 30% of total agricultural GDP.

Body:

- **Mission for Integrated Development of Horticulture (MIDH)** is a Centrally Sponsored Scheme for the holistic growth of the horticulture sector covering fruits, vegetables, root & tuber crops, mushrooms, spices, flowers, aromatic plants, coconut, cashew, cocoa and bamboo.
- It subsumed six ongoing schemes of the Department of Agriculture and cooperation on horticulture development. Out of these six schemes three are centrally sponsored schemes: National Horticultural Mission; Horticulture Mission for North east and Himalayas; National Bamboo Mission and the three Central sector schemes: National Horticulture Board; Coconut Development Board; Central Institute of Horticulture, Nagaland

Achievements of MIDH (Cumulative Achievement (2005-06 to 2017-18)) are:

- **Area Expansion:** An additional area of 36.13 lakh ha. of identified horticulture crops has been covered.
- **Nurseries:** 4554 nurseries have been established for production of quality planting material. **Rejuvenation:** An area of 6.57 lakh ha. of old and senile orchards has been rejuvenated.
- **Organic Farming:** An area of 2.71 lakh ha. been covered under organic practices
- **Integrated Pests/Nutrient Management:** An area of 17.14 lakh ha. has been covered under IPM/INM
- **Integrated Pests/Nutrient Management Infrastructures:** 536 units of IPM infrastructures have been set up.
- **Protected Cultivation:** An area of 31 lakh ha. has been covered under Protected Cultivation.
- **Water Resources:** 95887 water harvesting structures have been created.
- **Beekeeping:** 31 lakh bee colonies with hives have been distributed.
- **Horticulture Mechanization:** 94 lakh horticulture mechanization equipments have been distributed.
- **Post Harvest Management Infrastructures:** 78776 post harvest units have been established.
- **Market Infrastructures:** 4144 market infrastructures have been set up.
- **Centre of Excellence:** 25 Center of Excellence have been established.
- **Training of Farmers:** under HRD, 21.71 lakh farmers have been trained under various horticulture activities.

Horticulture can help doubling farmer's income by implementing the following:

- Revisiting zones for different crops keeping into account the changing climate particularly in the hills.
- Ensuring availability of quality seed including hybrid of vegetables, flowers and planting material of fruit trees for better quality and produce.
- Diversification of Horticultural crops along with other activities like bee keeping mushroom cultivation, backyard poultry, sericulture, fish culture etc.,
- Post harvest management of horticultural crops through grading, packaging, and on farm primary processing for value addition and product development.
- Introduction of potential new varieties, and replacing the old and low productive varieties. Rejuvenation of old and unproductive orchards.
- Tree architecture management through training and pruning for enhanced quality and production of crops.

- Promotion of organic farming practices in vegetables and fruits production and suitable marketing must be done for the organic produce.
- Popularisation of local / indigenous or underutilised horticultural crops and promoting cultivation of flowers and medicinal plants.
- Promoting intercropping with vegetables, flowers, medicinal and aromatic plants and short duration fruit crops.
- Adopting drip irrigation cum fertigation system of irrigation for more crop per drop. Weather forecasting advisory body to be popularised for strategic planning of cultural practices for minimising losses.
- Promotion of contract farming and buy back arrangement for encouraging farmers to adopt horti based farming.
- Promotion of horti tourism in states like J&K, HP, Uttarakhand, and North eastern states.

Ministry of Agriculture & Farmer's Welfare, Government of India

Mission for Integrated Development of Horticulture

Production of quality planning material

- Nurseries, Tissue culture labs, seed infrastructure, hybrid seeds import of planning materials**
- Area expansion i.e. Establishment of new orchards gardens for fruits, flowers, and hybrid vegetables.**
- Creation of market linked cold-chain logistics and PHM facilities.**
- Rejuvenation of unproductive, old, and senile orchards**
- Creation of water resources structures and watershed management.**
- Protected cultivation i.e. poly-house, green-house, shade-nets, etc for growing off-season high value vegetables and flowers.**

Join Us : **agriGol** **AgriGol** **agricoop.gov.in**

Conclusion:

- Over the years, horticulture has emerged as one of the potential agricultural enterprise in accelerating the growth of the economy. Its role in the country's nutritional security, poverty alleviation and employment generation programmes is becoming increasingly important. On account of significant production increases in horticultural crops across the country, a Golden revolution is in the offing and India has emerged as a leading player in the global scenario.

Q) Despite farm productivity rising in the country, severe distress in the Agriculture sector is still a cause of concern. How grave is the situation ? Discuss with respect to small and marginal farmers. (250 words)

The hindu

Why this question:

The article highlights the need for interventions that are required on demand and supply side to alleviate farm distress in the country.

In the current times of elections and their manifesto aiming at votes in the name of loan waivers, the author brings out causes and consequences facing the farm sector in the country.

Demand of the question:

This question seeks to examine

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

Start with brief introduction – quote some facts to highlight the situation of farm distress in the country.

Body

Discuss the following points in detail:

- What are the factors causing farm distress in the country?
- Public investment in the sector as a percentage of GDP is also stagnant.
- Declining size of land holdings.
- prices are much lower than the MSP [minimum support price] in the market.
- long-term problems such as low capital formation in agriculture persist. Etc.
- Present a case of small and marginal farmers, why is their case different? – take hints from the article and provide for suitable points.
- What needs to be done? – suggest measures to overcome the distress.

Conclusion

Conclude with what needs to be done – suggest holistic approach required to address the problem.

Introduction:

- Farm incomes have been squeezed by slower output growth, higher costs and increased vulnerability to a changing climate.
- Economists said that the GDP deflator for agriculture is negative for the first time in many years. The NSSO Situation Assessment Survey of Agricultural Households (2013) shows that 52% of farming households are indebted, with rates as high as 89-92% in some States.

And there are a slew of new problems resulting directly from government policies. The recent marches to New Delhi, Mumbai by thousands of farmers are any indication, the farm sector has already sent up emergency flares.

Body:

Factors causing farm distress in the country:

- **High Input costs:**
 - Land degradation has become a major challenge and cost of farming is constantly rising with usage of fertilizer, pesticides, expensive seed varieties, machinery, labour cost, rise in fuel prices, vagaries of monsoon. This further complicates the livelihood of farmers
 - In India, farmers are poor due to low productivity (yield per hectare) of all major crops.
 - Growth in rural lending has decreased and indeed most of the rural lending is indirect rather than direct.
- **Farmers income remained low:**
 - India had record food production in 2017-18, but farmers' income remained low and stagnant.
 - According to Ashok Dalwai committee, farmer's income remained about 15-40% of consumer's price.
 - Studies conducted by the International Food Policy Research Institute and World Bank have confirmed this.

- **Government Policies:**
 - India has excessively dependent on MSP to drive crop planning by farmers. MSP is restricted only to few crops.
 - In good harvest years, neither are MSP increased to ensure a floor price that covers costs and offers a remunerative return, nor is enough procured to ensure that even the MSP offered serves as a floor for market prices.
 - The government continues to use old draconian measures, including stocking restrictions and bans on exports and futures trading, to even small increase in food prices. Such steps may bring temporary relief to consumers, but end up hurting farmers.
 - Fiscal conservatism has adversely affected public investment in irrigation, drainage and flood control.
 - Liberalised imports of agricultural commodities including foodgrains and cotton have dampened domestic prices
- **Middlemen troubles:**
 - As pointed out by Ramesh Chand, in Punjab, there are as many as 22,000 commission agents and innumerable middlemen in each market.
 - According to Ashok Gulati, former chairman of the Commission for Agricultural Costs and Prices, commission agents in Delhi charge exorbitant fees ranging from 6 per cent to 15 per cent.
- **Rigid Market Structure:**
 - Prevalence of APMC markers, trader cartels due to which low price for agri produce is offered specially due to bumper crop production.
- **Poor Infrastructure and Logistics:**
 - Lack of diffusion of adequate storage facilities lead to wastage. For instance farmers dump truckloads of vegetables on road.
 - Food Parks projects concentrated near to cities and poor maintenance leads to spoilage of the crops.
 - Cold storage units exist in less than one-tenth of the markets and grading facilities in less than one-third; electronic weigh-bridges are available only in a few markets.
- **Aggressive cultivation led to plunging in demand:**
 - Once prices have increased farmers cultivated the crop aggressively leading to plunging of prices.
 - Two years ago, garlic fetched an average Rs 60 per kg rate in Rajasthan's Kota mandi. Enthused by it, farmers in the Hadoti region planted more area, only to see prices halve last May.
 - Similar was the case for other vegetables. Example: Tomato, Toor Dal etc.
- **Pro-Consumer bias:**
 - In most years, for the majority of agri-products, the policymakers used restrictive export policies to keep domestic prices low. This showed the pro-consumer bias in the policy complex.
- **Information Asymmetry:**
 - A bumper crop can pull down prices in wholesale markets. Price spikes after a poor crop are inevitably dealt with through cheap imports in a bid to protect consumers. The opposite is done less frequently. This is due to lack of information.
 - The bountiful rains of 2016 resulted in record farm output. Prices crashed. Farmers are reported to have not been able to even recover the cost for some crops.
 - The prospects of a good monsoon pushed up rural wages. The reality of rock bottom prices then destroyed profit margins.

Measures needed:

- **Credit, finance and Insurance:**
 - A functional institutional credit system which is accessible and accountable to all cultivators.
 - This covers not only land-owning farmers but also sharecroppers, tenants, adivasi and women farmers, and animal-rearers.
 - Credit products for agriculture need to be tailor-made based on cropping and rain cycle, specific to a particular region. The regional offices of commercial banks should contribute in this exercise. Registration of all cultivators and providing Kisan credit cards.
 - The period of crop loan should be extendable to four years, given that, on average, every second or third year the spatial distribution of rain pattern is erratic in India.
 - Strengthen agricultural insurance, reforming agricultural marketing and introduction of model contract farming act

- **Input Costs:**
 - It is more important to make agriculture sustainable by reducing input costs of seeds, fertilizers and other inputs.
- **Remunerative Prices:**
 - Extending reach of minimum support price which has been dedicated to few crops and in a narrow geographical area is important.
 - Set up of Futures and Trade markets, tie up of farmer and private companies for procurement should be looked into as alternative methods against distress sale.
- **Agro- Produce Marketing and Processing:**
 - The agro-processing industry and warehousing needs to expand so that agricultural produce can be stored when prices plunge.
 - Promoting viable farmer collectives to act as a “collective voice of marginal and small farmers”.
 - Legislations on the basis of NITI Aayog’s new model law — Agricultural Produce and Livestock Marketing (Promotion and Facilitating) Act (APLM) should be enacted in all states.
- **Technology:**
 - Use of technology to aid farmers like drip and sprinkler irrigation.
 - Precision agriculture, GM Crops should be encouraged drought prone areas.
 - Space technology and Mobiles should act as “Eyes and Ears” of the farmers to assist in farming.
- **Distress Management:**
 - Establish farmers’ distress and disaster relief commissions at the national and State levels, based on the model of Kerala Farmers’ Debt Relief Commission.

Conclusion:

- Farmers’ distress is due to low prices and low productivity. **Limited procurement, measures to improve low productivity, and consolidation of land holdings to gain the benefits of size, can help in reducing agrarian distress.**
- The challenge before government is to deliver on the institutional solutions backed by a long term policy demanded by farmers as against temporary solutions of loan waivers

Q) What is the basic idea behind initiating the e Choupal ? Discuss how it has proved to be an aggregator of Agricultural Services. (250 words)

[The hindu](#)

Why this question:

YC Deveshwar, the man who transformed ITC into a multi-business conglomerate, passed away recently. The e Choupal is a flagship program of the ITC -aimed at linking directly with farmers via the Internet for procurement of products by entering the FMCG space in rural areas.

Key demand of the question:

The answer is straightforward, one must discuss in detail the flagship ITC program of e Choupal and significance of it in proving to be an aggregator of Agri services to the country.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines, highlight the key aspects of e Choupal.

Body:

Answers must discuss the following aspects :

- What is e-Choupal? – the two-decade old initiative from ITC aimed to web-enable farmers to overcome challenges related to information access and procurement.
- Discuss the salient features of the project.
- Explain how it catalyzed the protection of farmers from the abuse of the agents? Acted as an agglomerate of agricultural services?
- The focus of the answer must be on the welfare aspect that the project brought in for the Farmers.
- Provide for way forward.

Conclusion –

Conclude by reasserting significance of such initiatives of private companies in policy making of the country.

Introduction:

- e-Choupal is an initiative of **ITC Limited**, a conglomerate in India, to link directly with rural farmers via the Internet for procurement of agricultural and aquaculture products like soybeans, wheat, coffee, and prawns.
- e-Choupal tackles the challenges posed by Indian agriculture, characterized by fragmented farms, weak infrastructure and the involvement of intermediaries. The programme installs computers with Internet access in rural areas of India to offer farmers up-to-date marketing and agricultural information.

Body:

The ITC chose to operate the platform on the following **three business principles**:

- (i) Free information and knowledge which ensures wider participation by the farmers.
- (ii) Freedom of choice in transactions (farmers after accessing information at the e-Choupal, are free to transact their own way.)
- (iii) Transaction based income, stream for the Sanchalak by tying his revenue stream to the transaction (on a commission basis.)

Implications of e-Choupal:

- ITC Limited has provided computers and Internet access in rural areas across several agricultural regions of the country, where the farmers can directly negotiate the sale of their produce with ITC Limited.
- Online access enables farmers to obtain information on mandi prices, and good farming practices, and to place orders for agricultural inputs like seeds and fertilizers. This helps farmers improve the quality of their products, and helps in obtaining a better price.
- ITC Limited kiosk with Internet access is run by a **sanchalak** — a trained farmer. The computer is housed in the sanchalak's house and is linked to the Internet via phone lines or by a VSAT connection.
- Each installation serves an average of 600 farmers in the surrounding ten villages within about a 5 km radius. The sanchalak bears some operating cost but in return earns a service fee for the e-transactions done through his e-Choupal.
- The warehouse hub is managed by the same traditional middle-men, now called **samyojaks**, but with no exploitative power due to the reorganisation. These middlemen make up for the lack of infrastructure and fulfill critical jobs like cash disbursement, quantity aggregation and transportation.
- Driven by **increasing smart phone penetration** in the country coupled with declining data costs, the FMCG and hospitality conglomerate plans to launch a mobile version of the programme by middle of 2019.
- Since the introduction of e-Choupal services, farmers have seen a **rise in their income levels** because of a rise in yields, improvement in quality of output, and a fall in transaction costs. Even small farmers have gained from the initiative.
- Farmers can get **real-time information** despite their physical distance from the mandis. The system saves procurement costs for ITC Limited.
- The farmers do not pay for the information and knowledge they get from e-Choupals; the principle is to inform, empower and compete. e-market place for **spot transactions and support services to futures exchange**.
- There are **6,100 e-Choupals in operation in 35,000 villages in 10 states** (Madhya Pradesh, Haryana, Uttarakhand, Uttar Pradesh, Rajasthan, Karnataka, Kerala, Maharashtra, Andhra Pradesh and Tamil Nadu), affecting around 4 million farmers. In Uttar Pradesh, the pilot project has reached out to nearly 2, 00,000 farmers.
- As part of the e-Choupal initiative forward, ITC has also launched a program — '**baareh mahine hariyali**' — focused on helping farmers multiply their incomes by maximising farm utilisation over 12 months of the year. The programme has been implemented in four districts of Uttar Pradesh including Allahabad, Chandauli, and Ghazipur and Bihar's Munger district.

Conclusion:

- E-Choupal, the two-decade old initiative from ITC aimed to web-enable farmers to overcome challenges related to information access and procurement, is set for a major makeover this year. The new model, called **e-Choupal 4.0**, will be rolled out in the next couple of months

Q) Looking at agriculture from the social safety net lens is perhaps the reason behind agriculture not being treated as an income generator, and this itself has most of the time contributed to farm distress. Critically analyse the statement with respect to various competitive support offers made through different income security schemes for the farmers. (250 words)

Epw

Why this question:

The article discusses in detail how the discourse on Indian agriculture has been dominated by farm distress leading to politics of competitive support offers.

Key demand of the question:

The answer must debate about the interrelationship that is witnessed between the farm distress and the social security aspects provided through various schemes and policies.

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In a few introductory lines explain the context of the question.

Body:

- Highlight the current scenario of agrarian distress looming the Indian scenario.
- Discuss how often the political discourse on agriculture has focused on support to farmers, notwithstanding that what has most failed the Indian agriculture is markets for outputs.
- Explain the flaws associated with the schemes that aim to provide social security net, as to why they lead to farm distress eventually.
- Discuss that Social protection programmes often aim to address the underlying market failures that may have contributed to the persistent state of poverty but however they end up leading to farm distress.
- Discuss what needs to be done? – change in policy directions, focus shift to markets etc.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- The discourse on Indian agriculture has been dominated by farm distress leading to politics of competitive support offers.
- Several schemes have been pitched, such as the Pradhan Mantri Kisan Samman Nidhi, the Nyuntam Aay Yojana (NYAY), the Rythu Bandhu scheme of Telangana or the Krushak Assistance for Livelihood and Income Augmentation (KALIA) of Odisha.
- The unifying principle of these schemes is income or livelihood support for the farmers or poor households.

Body:

Cash transfer support schemes:

- Bhavantar Bhugtan Yojana in Madhya Pradesh was sought to provide relief to farmers by providing the differential between MSPs and market prices.
- The Rythu Bandhu scheme of the Telangana government provides ₹4,000 per acre for every season to all the farmers of the state. Similar initiatives have also been framed in Jharkhand and Odisha.
- In December 2018, Odisha launched the Krushak Assistance for Livelihood and Income augmentation (KALIA).
- Unlike RBS, KALIA is more complicated in design and implementation. It commits to give Rs 5,000 per SMF, twice a year, that is Rs 10,000 a year. It has already made payments to 1.2 million SMFs in January 2019.
- Recently the 2019 budget announced a scheme, Pradhan Mantri Kisan Samman Nidhi, under which vulnerable landholding farmer families, having cultivable land up to 2 hectares, will be provided direct income support of ₹6,000 a year.

Pros of support schemes:

- **Past experiences:**
 - Success of cash transfers for cooking gas, food and the rural jobs scheme also seem to have convinced the government on adopting the mechanism for agriculture.
- **Poverty reduction:**
 - Cash transfer programmes have become an important tool of social protection and poverty reduction
 - It has immediate impact on reducing hunger and rural poverty.
 - They can help households to overcome credit constraints and manage risk.
- **Better use:**
 - This can increase productive investment, increase access to markets and stimulate local economies.
 - Income support can be used to make a repayment or at least activate a bank account which can then receive a loan.
 - It can increase investment in agricultural inputs, including farm implements and livestock
- **Rural development:**
 - It can serve as an important complement to a broader rural development agenda, including a pro-poor growth strategy focusing on agriculture.

Negatives of support schemes:

- According to National Bank for Agriculture and Rural Development's All India Rural Financial Inclusion Survey (Nafis) small and marginal farmers earned Rs 79,802-1,19,878 in 2015-16.
- This means that the Rs 6,000 annual direct income transfer under PM-KISAN would be only about 5-8% of their existing income levels.
- This may not be much, particularly when compared with other direct income transfer (DIT) schemes rolled out in Telangana and Odisha.
- A Direct income transfer to landless labourers covered under KALIA's livelihood component is missing under PM-KISAN.
- Cash transfers are not greatly superior in terms of leakages compared to other schemes of in-kind transfer such as the public distribution system (PDS). Uncertainties in receiving uniform and periodic cash payment would reduce the validity of the scheme as income. Targeting errors are also likely.
- The real issue with the approach of a targeted cash transfer scheme is that it envisions the role of the state to only providing cash income to the poor. This kind of approach seeks to absolve the state of its responsibility in providing basic services such as health, education, nutrition and livelihood.
- Does not eradicate poverty:
 - It may address certain aspects of inequality by ensuring a basic income, they will not eradicate poverty. Poverty is measured as deficits in income or consumption, but the underlying causes of these shortages are linked to human capabilities and access to resources.
- Cash transfer scheme such as PMKSN cannot be substituted for subsidies and other institutional support systems such as the National Food Security Act-powered public distribution system. In fact, such cash transfer schemes could be counterproductive and may lead to more distress.
- Cash transfers do not solve the following problems which are the reasons for the current agrarian crisis
 - The Agrarian crisis is not just of low incomes in agriculture. The genesis of the current crisis lies in the faulty and ad hoc export-import policy, lack of infrastructure and cartelisation and collusion in agricultural markets, which have prevented farmers from realizing the market prices for agricultural produce.
 - Cash transfers do nothing to resolve any of these, nor are they any guarantee of protection against unforeseen events, whether natural or policy induced.
 - Cash transfer is neither a substitute for the structural reforms needed in agriculture, nor does it adequately compensate the farmer for the risks and uncertainty of crop cultivation.
- Regressive:
 - Except for the KALIA scheme, which offers some relief to the sharecroppers and landless labourers most other schemes are regressive with amount of transfer proportional to the land owned.
- Identifying beneficiaries is tough:
 - In sugarcane and cotton, much of the ground-level work is organised and in the hands of cooperatives, where the person who has the operational holding of land is well identified. But in crops where the ownership holding is different from the operational holding, it might be

- In the absence of proper tenancy records, it will also benefit the absentee landlords.
- It is no substitute for the lack of investment in agriculture, which has declined at 2.3% per annum in real terms
- By taking away precious fiscal resources, it makes the farmer more vulnerable to both market as well as non-market induced risks.
- Fiscal constraints to states:
 - The income transfer scheme will further erode the fiscal capacity of states.

Way forward:

- Policy focus should be rather on investment — in **efficient water management and irrigation, plant breeding and genetics, crop husbandry, market linkages and in breaking the middleman's hold over the farm-to-consumer value chain, replacing it with farmer-led enterprises, whether cooperatives or producer companies, that allow farmers to capture a share of the value added to their produce along its journey to the factory or home.**
- For a long-term solution, the government should first implement existing schemes, like it should give assured procurement and marketing of all commodities having MSP.
- The Swaminathan Committee in 2004 had recommended farmers be allowed to fix the price for their produce on their own (cost of production plus 50% as profit), keeping local factors in mind.
- Greater focus is required on enhancing farmer loan repayment capacity via smooth supply and value chains, and better price realisations.

Q) Write a short note on seafood industry of India. Explain the need for sustainable aquaculture to counter setbacks it is facing and increase the production. (250 words)

Economictimes

Why this question:

The article provides for a brief account of shrimp production in the country and the challenges that the seafood industry is witnessing.

Key demand of the question:

Answer must discuss the significance of seafood industry; the challenges and future it has for the country. Suggest what should be the way forward by focusing on the need for sustainable aquaculture.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines highlight the facts related to seafood industry of India.

Body:

- In brief discuss the following aspects:
- In 2017-18, India's seafood exports have seen a growth of 13.7% in quantity and 10.1% in value. Research expects that in 2019 India's seafood exports will grow at 17-18%, clearly showing a demand for Indian products.
- his industry contributes 6.3% to the total global fish production and has 14.5 million people engaged in various fisheries-related activities.
- Explain the significance of the industry in terms of – livelihood, essential commercial enterprise in terms of exports etc.
- Discuss what are the challenges?
- Role and need of sustainable aquaculture.

Conclusion:

Conclude with way forward.

Introduction:

- India is blessed with a coastline of over 8,118 kms, 2.02 million sq. km of EEZ, 0.5 million sq. km. Continental shelf estimated to have exploitable resources to the tune of 4.41 million tons of which about 3.40 million tons are presently exploited.
- India's seafood industry has become one of the leading suppliers of quality seafood to all the major markets of the world. India has world class seafood processing plants that follow quality control regimes compliant to stringent international regulatory requirements.

**Body:****Potential:**

- The estimated potential brackish water area suitable for shrimp farming is about 1.2 million hectare of which around 14% is utilized for farming, producing about 5 lakh tons of shrimp and scampi which is going to the export basket.
- Shrimps account for around 70% of the total seafood export from the country valued at Rs 45,000 crore.
- In 2017-18, India's seafood exports have seen a growth of 13.7% in quantity and 10.1% in value. Research expects that in 2019 India's seafood exports will grow at 17-18%, clearly showing a demand for Indian products..
- Seafood exports from India during the year 2014 – 2015 reached to an all time high of US\$ 5.5 Billion. 106 countries in the world taste Indian seafood, SE Asia, EU, USA, Japan, China and Middle East being the major markets.
- India is the second largest aquaculture producer in the world, largest exporter of shrimp to USA, the 2nd largest exporter of shrimps to Europe and the 4th largest exporter of shrimps to Japan.
- MPEDA envisage an ambitious target of US\$ 10 Billion for the year 2020.
- This industry contributes 6.3% to the total global fish production and has 14.5 million people engaged in various fisheries-related activities.

Current challenges faced:

- Shrimp production in the country, after showing a consistent growth in the last decade, is likely to drop by 10 to 15% this year as low prices and fear of spread of diseases among shrimps have forced aquaculture farmers to cut production in the farms.
- The stocking in the farms in south Andhra Pradesh is down by half while in north and central parts of the state, the situation is better with 80% of the farms well stocked.
- The aquaculture farmers lost money last year when white spot and EHP diseases reduced the shrimp output. This year, the fear of diseases has led many to stock less in farms.
- Little improvement in global shrimp prices and lack of funding support to farmers are the other reasons for the reluctance of farmers to go for full output.
- With increasing adoption of **product quality standards**, especially with respect to health and safety, the occurrences of Indian shrimp shipments failing to meet these standards are becoming common.

Other challenges faced:

- Since 1990s, three issues dominated Indian export scene: decline in overall catches, particularly shrimp; fluctuations in international markets depressing prices and profitability; and over-capitalisation of the production and marketing activities increasing risk.
- The emphasis on production is not supplemented by developing adequate infrastructure facilities to support them; the availability and quality of infrastructure remains insufficient.
- The contribution of fish from the seas has lowered now and the share is rising from inland farming.
- Water pollution; unscientific management of aquaculture and contamination of indigenous germplasm resources.
- Poor yield optimization, problems in harvest and post-harvest operations, landing and berthing facilities for fishing vessels and issues in welfare of fishermen.

Way forward:

- The need of the hour is technology upgradation fund for sustainable aquaculture development
- The recent creation of separate department for fisheries and a 2% interest subvention on loans to farmers by the Centre will go a long way in accelerating this
- The group recently launched sustainable, traceable, quality certified aquaculture hub model at Tuticorin. This must be expanding this to larger areas by transferring technology developed by us to farmers covering the entire gamut of value chain, right from broodstock availability.
- An approach that is increasingly being used around the globe is the use of sustainability standards and certifications such as MSC (Marine Stewardship Council) or ASC (Aquaculture Stewardship Council) as a way to assure buyers of the safety, quality and environmental responsibility of their products.

Conclusion:

- Indian Aquaculture is highly promising and has grown over six and half fold in the last two decades with freshwater aquaculture contributing over 95% of the total aquaculture production.
- All the 3 sub sectors viz. Inland, Aquaculture and Marine fisheries have a lot of scope for improvement. The recent step of creating FAIDF is a praised step to boost the fisheries sector to the desired level.

Key demand of the question:

The answer must provide for a detailed analysis of the transformative changes that Indian power sector has witnessed recently. Our country jumped to 24th rank in 2018 on World Bank's Ease of Getting Electricity in the world as against 111th rank in 2014. This is a quantum leap. One has to justify the developments and bring out the shift in policy making that has led to such a transformative change. Also suggest what should be the way ahead to ensure power for all.

Directive word:

Analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer

Introduction:

write a few introductory lines – quote relevant facts justifying changing scenario of Indian power sector.

Body:

Answers must discuss the following aspects :

- Access to reliable and affordable energy increases the ease of living and generates employment. It powers the development of the country.
- Discuss the recent initiatives taken by the government in this direction, marked shift in policy making from traditional methods to modern technologies.
- Achievements – More than one lakh megawatts of new generation capacity has been added.
- Energy deficit has been brought down from 4.2 per cent to almost zero.
- India has become an exporter of electricity exporting electricity to Nepal and Bangladesh.
- One lakh circuit kilometres to the inter-state transmission capacity-connecting the entire nation to one grid.
- Now, for the first time we have One nation- One Grid –the entire network operating on one frequency. Power can be transferred seamlessly from one corner of the country to another.
- A major landmark to universal access to electricity was crossed when our country achieved 100% village electrification.
- What should be the way forward?
- Significance of power for all .

Conclusion –

Conclude with need for sustainable energy in future.

Introduction:

- Electricity is the key element in modern day life. Right from powering industrial units and running irrigation pumps to charging your mobile phones electricity does it all. Access to reliable and affordable energy increases the ease of living and generates employment.
- It is a prerequisite to digital connectivity in rural India, thereby opening new vistas for the people hitherto unconnected to the outer world. India's power sector is one of the key sectors which form the foundation of the growth of the country.

Body:

The recent initiatives taken by the government in this direction:

- Government of India launched “**Pradhan Mantri Sahaj Bijli Har Ghar Yojana**” (Saubhagya) in Sept. 2017 to achieve the goal of universal household electrification in the country by 31st March 2019.
- The scheme envisages providing last mile connectivity and electricity connections to all remaining households in rural as well as urban areas.
- In order to encourage Renewable Generation, Ministry of Power extended the waiver of ISTS Transmission charges and losses for Solar and Wind based Projects upto March 2022.
- In order to achieve the Renewable target of 1,75,000 MW of Renewable capacity by 2022, MOP issued Long Term Growth trajectory Renewable Purchase Obligation (RPO) for Solar as well as Non-Solar till the year 2022.
- With the aim of promoting renewable generation and reduction of emission, MOP issued a scheme on Flexibility in generation and scheduling of Thermal Power Stations to reduce emissions.
- MoP has issued a direction to the CERC under section 107 of the Electricity Act, 2003 on 30th May, 2018 for implementation of new Environmental Norms for Thermal Power Plants suggested by MOEF&CC.

- In order to reduce the overall cost of generation as well as cost of power to consumer (Company level merit order operation), MOP issued a scheme on Flexibility in generation and scheduling of Thermal Power Stations to reduce cost of power to consumers.
- In our endeavour for revival of the stressed assets, a Pilot Scheme was introduced by MOP in April 2018 to facilitate procurement of aggregated power of 2500 MW for 3 (three) years (covered under medium term) from the generating companies having coal based Power Plants which are already commissioned without having a power purchase agreement for the quantum of power the Bidder is willing to bid.
- Major reform initiatives are being taken by Ministry of Power which includes addressing various issues being faced by electricity sector through draft amendments proposed in Electricity Act 2003 and Tariff Policy, 2016.

Despite the fact that India has surplus energy, it is facing huge problems which serve as an obstacle for supplying electricity to all needy people. The troubles of power companies can be traced to structural issues such as the

- **Absence of meaningful price reforms**
- **Unreliable fuel supply** – Shortage of fuel for power plants has become very critical in recent months. Many of the coal mines sold off in auction, mandated by the Supreme Court verdict, are simply not operational.
- The unsustainable finances of public sector power distribution companies.
- Grid reliability challenges are more severe in dispersed rural areas than in cities.
- To install electrical connections to about 30 million homes that are still off the grid is a big challenge.
- Electricity supply is controlled and maintained by India's state governments, and, these government-owned distribution companies "remain the weakest link" in the power sector value chain.

Way forward: We need innovative solutions to address the electricity access challenges posed by rural India:

- The federal government must push the state-run distribution companies to carry out robust ground surveys and organize frequent camps to achieve the target so that not one household is left out from electrification.
- Considerable improvement in the operational efficiency of distributors through extensive and intensive change management and capacity-building programmes as well as strengthening of the electricity sub-stations and sub-transmission network are required.
- Decentralized renewable energy solutions such as mini-grids and rooftop solar, where the grid can't reach or reliably serve, and operating together is the most sustainable last-mile solution to reach consumers and achieve universal access to energy.
- Supply of coal will have to be increased by Coal India by following a strategy pursued during 2014-15 and 2015-16, when coal production saw an unprecedented increase
- Power-generating companies should not be saddled with the burden of cross-subsidising the renewable sector. This can be borne by the society (through taxation) and not by the entities that are already in trouble.
- Village-level entrepreneurs could be contracted to operate and maintain the local distribution while generating bills and collecting revenues from the customers.
- Banking on community relationships, these entrepreneurs could improve compliance on payments as well as curb stealing of power.
- Recruiting and training local youth could help address maintenance issues. This will also help in creating more skilled jobs and entrepreneurs in rural areas.
- Pre-paid and smart metering systems are other ways to encourage payments. Such solutions need to be piloted and tested.

Q) Discuss the objectives of Ujjwal DISCOM Assurance Yojana (UDAY), How far has UDAY been able to address the stagnation/decline in the electricity generation capacity of State power utilities ? (250 words)

[The hindu](#)

Why this question:

The article highlights the recent report made by Crisil that suggested State-owned power generation firms have to become commercially viable. Aggregate external debt of State-owned electricity distribution companies (discoms) is set to increase to pre-Ujjwal Discom Assurance Yojana (UDAY) levels of ₹2.6 lakh crore by the end of this fiscal, according to Crisil's analysis of discoms in 15 States, which account for 85% of the aggregate losses.

Key demand of the question:

Analyse in detail the role played by UDAY – its features and objectives, what are the current issues in the State power utilities, how is UDAY addressing it etc.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines highlight the observations made by Crisil.

Body:

In brief discuss –

- Discuss the Scheme Objectives:
- The scheme was launched for operational and financial turnaround of State-owned Power Distribution Companies (DISCOMs).
- It aims to reduce the interest burden, reduce the cost of power, reduce power losses in Distribution sector, and improve operational efficiency of DISCOMs.
- Strategy of UDAY? – four initiatives (i) Improving operational efficiencies of DISCOMs; (ii) Reduction of cost of power; (iii) Reduction in interest cost of DISCOMs; (iv) Enforcing financial discipline on DISCOMs through alignment with State finances.
- What is the current scenario?
- Discuss the efforts of the government in this direction.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- Ujwal DISCOM Assurance Yojana (UDAY) is a financial restructuring and efficiency enhancing program, aims to reduce the debt burden of the state owned electricity distribution companies (DISCOMs) started in 2015.
- Though the main component of UDAY is debt management, other measures like raising operational efficiency are also proposed to permanently settle the debt scenario of DISCOMs.

Body:

Objectives of UDAY:

- Improving operational efficiencies of DISCOMs;
- Reduction of cost of power;
- Reduction in interest cost of DISCOMs;
- Enforcing financial discipline on DISCOMs through alignment with State finances.

Features:

- Scheme aims at financial turnaround and revival of Power Distribution companies (DISCOMs) and ensures a sustainable permanent solution
- It allows power DISCOMs in selected states to convert their debt into state bonds as well as roll out number of measures to improve efficiency at power plants
- It improves operational efficiencies of DISCOMs, Reduce of cost of power, Reduce interest cost of DISCOMs, Enforce financial discipline on DISCOMs.
- Improve operational efficiency by swapping of coal linkages, monitoring technical and commercial (AT&C) losses, smart metering and feeder separation in states
- The operational efficiency includes compulsory smart metering, upgradation of transformers and meters to reduce electricity lost during transmission and distribution (or theft).

Appraisal of UDAY:

Positives:

- It took off well, with a large number of states joining the scheme. Several states took over the debt of their utilities, improving their liquidity situation. Anecdotal evidence also suggests an improvement in the power supply situation.
- Government's UDAY scheme has helped debt-laden discoms of 24 states to reduce losses to Rs 369 billion in 2016-17 from Rs 515.9 billion in the previous financial year.
- The participating states have achieved an improvement of one per cent in Aggregate Technical & Commercial (AT&C or distribution) losses and Rs 0.17 a Unit in the gap between Average Cost of Supply and Average Revenue realised in 2016-17

**Challenges persist:**

- Four years on, the results of UDAY remain unclear and questionable. Many tasks are running behind schedule like smart meter installations.
- AT&C losses remain high, with some states indicating losses of over 40 per cent, a far cry from the 15 per cent target.
- The gap between average cost of supply (ACS) and the average revenue realised (ARR) continues to be high in most states.
- Much of the NPA (non-performing asset) or bad loan resolution in the power sector is beyond UDA
- Over and above the prevailing maladies in the distribution system rising share of renewable energy (RE) is increasing the average cost of supply, as it is displacing consumption of low-cost coal.
- The bonds issued are essentially held by the same entities that had lent funds to the State electricity boards (SEBs).
- The interest received is lower by at least 4-6 per cent; this means that there is a loss of income. Intuitively, it can be seen that every ₹1 lakh crore of UDAY bonds issued involves a loss of up to ₹6,000 crore for banks and FIs that have lent money to them.
- There is no guarantee that there will not be future losses as there is no retribution if the State electricity boards choose not to reform. In fact, this has been kept out of the purview of the scheme.
- By also mandating that State governments have to progressively take over the losses of their SEBs, the Centre has put the onus on the States to deal with the problem.

Way forward:

- Discom business needs to be fundamentally restructured.
- Governance needs to be improved with greater resilience to political influence.
- Robust mechanisms need to be put in place to ensure tariff rationalisation and follow-through on subsequent increases.
- Market-friendly electricity reforms need to be introduced and enforced. This includes expanding the role of short-term markets, as well as strict enforcement of PPAs to assure investors and developers of the legal sanctity of contracts signed with discoms.
- Streamlining the open access process, with the fair application of additional surcharges will boost the demand for renewable energy from the commercial and industrial sectors.
- Discoms will have to be pushed harder to invest in technical solutions and infrastructure upgrade such as feeder separation, installing smart meters and undertaking detailed data collection and analysis.
- Strict Actions to curb Electricity theft and other actions those lead to Losses to DISCOMs.
- Integrating UDAY scheme with Make in India and Startup India to ensure overall Development.
- Integrating UDAY with KUSUM to increase amount of electricity to DISCOMS.

Q) Elaborate upon the key features of Faster Adoption and Manufacturing of Hybrid and Electric Vehicles (FAME-II) scheme, what is the potential it carries for India in the renewable energy sector? (250 words)

[Livemint](#)

Why this question:

The article discusses in detail in the coming of FAME-II, its impact on the energy sector of the country. The Inter-Ministerial Steering Committee of the National Mission for Transformative Mobility has recently decided to incorporate localization conditions to avail benefits under the FAME-II Scheme. Thus it is necessary for us to evaluate the scheme from exam point of view.

Key demand of the question:

The question expects

Directive word:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

Begin with brief on the significance of the scheme.

Body:

- Discussion should include the following aspects –

- salient features of FAME II scheme –
- aims to boost electric mobility and increase the number of electric vehicles in commercial fleets.
- Target: The outlay of ₹10,000 crore has been made for three years till 2022 for FAME 2 scheme.
- The government will offer the incentives for electric buses, three-wheelers and four-wheelers to be used for commercial purposes.
- Plug-in hybrid vehicles and those with a sizeable lithium-ion battery and electric motor will also be included in the scheme and fiscal support offered depending on the size of the battery.
- Discuss its potential – how FAME II scheme will help improve charging infrastructure.
- What are the issues and associated concerns?
- Discuss what can be done to overcome the concerns associated.

Conclusion:

Conclude with way forward.

Introduction:

- FAME India is a part of the **National Electric Mobility Mission Plan**. To promote manufacturing of electric and hybrid vehicle technology and to ensure sustainable growth of the same, Department of Heavy Industry is implementing FAME-India Scheme Phase – I [Faster Adoption and Manufacturing of (Hybrid &) Electric Vehicles in India] from 1st April 2015 till 31st March 2019.
- FAME-II proposes to give a push to electric vehicles (EVs) in public transport and seeks to encourage adoption of EVs by way of market creation and demand aggregation.

Body:

‘Faster Adoption and Manufacturing of Electric Vehicles in India Phase II (FAME India Phase II)’ scheme:

- The scheme with total outlay of Rs 10000 Crores over the period of three years (2019-20 to 2021-22) will be implemented with effect from 1st April 2019.
- This scheme is the expanded version of the present scheme titled ‘FAME India1’ which was launched on 1st April 2015, with total outlay of Rs. 895 crores.

Key Features:

- Emphasis on electrification of the public transportation that includes shared transport.
- In 3-Wheel (W) and 4-Wheel (W) segment incentives will be applicable mainly to vehicles used for public transport or registered for commercial purposes.
- In the 2-Wheel (W) segment, the focus will be on the private vehicles.
- To encourage advance technologies, the benefits of incentives, will be extended to only those vehicles which are fitted with advance battery like a Lithium Ion battery and other new technology batteries.
- The scheme proposes for establishment of charging infrastructure, whereby about 2700 charging stations will be established in metros, other million plus cities, smart cities and cities of Hilly states across the country so that there will be availability of at least one charging station in a grid of 3 km x 3 km.
- Establishment of Charging stations are also proposed on major highways connecting major city clusters.
- On such highways, charging stations will be established on both sides of the road at an interval of about 25 km each.

Potential of FAME-II scheme:

Automobile Sector:

- 100% FDI by automatic route is permitted in the automobile sector.
- Further, the sector is deregulated, both private sector and public sector are free to carry out investment in the automobile sector, including for manufacturing of Electric Vehicles and E-Buses.

Charging Infrastructure:

- The centre will invest in setting up charging stations, with the active participation of public sector units and private players.
- It has also been proposed to provide one slow-charging unit for every electric bus and one fast-charging station for 10 electric buses.
- Projects for charging infrastructure will include those needed to extend electrification for running vehicles such as pantograph charging and flash charging.
- FAME 2 will also encourage interlinking of renewable energy sources with charging infrastructure.

Challenges involved:

- **Coordination among various stakeholders:**
 - EVs, unlike ICE vehicles, involve several actors at the national, State and city levels, respectively

- Multiple ministries such as Road Transport and Highways, Housing and Urban Affairs, Heavy Industries, Power, New and Renewable Energy, External Affairs as well as national institutes such as NITI Aayog should work together.
- State and city-level players need to be involved so as to address several technical and infrastructural needs.
- **EV battery production:**
 - India does not produce lithium-ion (Li-ion) batteries currently, and companies making battery packs are dependent exclusively on imports from China.
 - This is a cost-saving strategy as setting up a cell manufacturing unit in India would be expensive.
 - But, accelerating EV use in India should be linked to the “Make in India” goal and domestic battery production.
- **Charging infrastructure:**
 - Charging infrastructure for electric vehicles in India has not been fully developed yet.
- **Jobs and the economic impact:**
 - India is one of the largest producers of motor vehicles and the sector is estimated to provide direct and indirect employment to 3 crore people. And it is estimated to grow further.
 - EVs have the potential to disrupt the mobility ecosystem, and, if implemented well, could have a positive impact on the economy as well as the urban environment.

Way forward:

- India needs auto industry’s active participation to ease electric mobility transition.
- The auto and battery industries could collaborate to enhance customer awareness, promote domestic manufacturing, promote new business models, conduct R&D for EVs and components, consider new business models to promote EVs.
- Government should focus on a phased manufacturing plan to promote EVs, provide fiscal and non-fiscal incentives for phased manufacturing of EVs and batteries.
- Different government departments can consider a bouquet of potential policies, such as congestion pricing, ZEV credits, low emission/exclusion zones, parking policies, etc. to drive adoption of EVs
- Both Central and State Governments should support clean energy research in general. That way, the government does its part in steering the policy ship

Conclusion:

- Environment-friendly EVs will reduce air pollution and thus contribute to the fight against climate change. As per **NITI Aayog’s report** EVs will help in cutting down as much as 1 Gigatonne (GT) of carbon emissions by 2030.
- The government should have a role. Instead of trying to pick winners, the government should focus on building an enabling business environment that supports research and innovation.

Q) What have been the major reasons for the development of solar energy in India despite its high potential ? Discuss the achievements so far and challenges in harnessing it. What should be the way forward. (250 words)

Why this question:

The question is about analyzing why is scope of producing solar energy so high in India with potential being one factor there are other factors too that push the development of Solar energy.

Key demand of the question:

Answer must discuss the causative factors of developing solar energy in India in detail.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines state some facts/statistics related to solar energy production in India.

Body:

In brief discuss the following factors:

- Why is scope of producing solar energy so high in India? – India has tremendous scope of generating solar energy. The geographical location of the country stands to its benefit for

generating solar energy. The reason being India is a tropical country and it receives solar radiation almost throughout the year, which amounts to 3,000 hours of sunshine.

- Quote reasons apart from these above major factors – power requirements, dependency, export etc.
- Discuss the achievements so far.
- Issues and concerns associated
- What needs to be done?

Conclusion:

Conclude with significance of solar power to India.

Introduction:

- National Solar Mission envisages establishing **India as a global leader in solar energy**. The Mission has set the ambitious target of **deploying 100GW of grid connected solar power by 2022**. (40 GW Rooftop and 60 GW through Large and Medium Scale Grid Connected Solar Power Projects). The country's solar installed capacity reached **25.21 GW as of 31 December 2018**

Body:

The major reasons for the development of solar energy in India:

- **Energy Security:**
 - As Indian population continues to grow and the limited amount of fossil fuels begins to diminish, it may not be possible to provide the amount of energy demanded by the world by only using fossil fuels to convert energy.
 - India's current energy use is unsustainable.
 - India has been dependent to a large extent on energy imports to meet its national energy requirements.
 - It is estimated that at current rates of production, oil will run out in 53 years, natural gas in 54, and coal in 110.
- **Economic Constraints:**
 - India imports almost 80% of her oil needs, generates 60% of her electricity from coal-based thermal power plants. However, these being fossil fuels, they are dwindling at quick rates.
 - The **geo-political scenario** is volatile leading to energy insecurity of India
 - It not only results in huge government subsidies, but also substantial health and environmental hazards.
- **Social Needs:**
 - Nearly 300 million people in rural India lack access to grid-connected power, promoting use of archaic sources of energy such as kerosene, diesel, wood-fired chulhas, etc.
 - Mostly energy demands are fulfilled by subsidised kerosene, leading to loss for exchequer.
- **Environmental Concerns:**
 - India lying in tropical belt has an advantage of receiving peak solar radiation for 300 days, amounting 2300-3,000 hours of sunshine equivalent to above 5,000 trillion kWh.
 - Debate of global warming and climate change is compelling the world to move from fossil based energy towards clean and green energy.
 - With its pollution free nature, virtually inexhaustible supply and global distribution, solar energy is very attractive energy resource.
 - India's Intended Nationally Determined Contributions (INDC's) commitments include 100 GW of solar power out of 175 GW renewable energy by 2022.

Achievements:

- National Solar Mission envisages establishing **India as a global leader in solar energy**.
- The Mission has set the ambitious target of **deploying 100GW of grid connected solar power by 2022**. (40 GW Rooftop and 60 GW through Large and Medium Scale Grid Connected Solar Power Projects).
- The country's solar installed capacity reached **21 GW as of 31 December 2018**.
- India along with Paris, on the sidelines of UNFCCC's CoP 21 at Paris (2015) decided to set up **International Solar Alliance**.
- The ISA's major objectives include global deployment of over 1,000GW of solar generation capacity and mobilisation of investment of over US\$ 1000 billion into solar energy by 2030.

Challenges:

- India's solar story is largely built over imported products.

- India's domestic content requirement clause is facing legal challenge at WTO.
- India is facing challenge to balance Prioritising domestic goals and WTO commitments.
- The dumping of products is leading to profit erosion of local manufacturers.
- Indian domestic manufacturers aren't technically and economically strong to compete with Chinese companies.
- China's strong manufacturing base is giving stiff challenge to domestic manufacturer.
- Land availability in India for solar plant is less due to high population density.
- India's solar waste is estimated to be around 1.8 million by 2050 also needs to be tackled.

Way Forward:

- Strong financial measures are required to finance the solar projects, innovative steps like green bonds, institutional loans and clean energy fund can play a crucial role.
- Promotion of research and development in renewable energy sector, especially in storage technology.
- Proper mechanism should be provided to tackle China's dumping of solar equipments.
- Framework to avoid unnecessary delays in policy decision making and implementation.
- India needs a Solar Waste Management and Manufacturing Standards Policy.

Topic: Science and Technology- developments and their applications and effects in everyday life

Q) What do you understand by Autonomous Vehicles ? Discuss the Ethical concerns involved in their launch. (250 words)

Indianexpress

why this question:

The article is in the backdrop of recent move by the Tesla that declared to offer fully autonomous vehicles by the second quarter of next year. The article tries to capture why the world is not yet ready for autonomous vehicles.

Key demand of the question:

The answer must provide for a detailed narration of what we understand by autonomous vehicles, what are the associated benefits and concerns, ethical issues involved and why the world is not yet ready to embrace the technology change.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines about the move made by Tesla.

Body:

Answers must discuss the following aspects :

- What do you understand by Autonomous Vehicles? – A driverless car, also called autonomous car or self-driving car, is a vehicle which can sense its surrounding environment and can navigate without human input. It combines multiple sensors and techniques to perceive their surroundings like radar, laser light, GPS, odometer, computer vision, etc. The advanced control systems interpret the sensory information for identifying the obstacles, relevant signage and navigation paths.
- What are the issues involved in self-driving vehicles? – snow and weather; When it's heavy enough to cover the pavement, snow blocks the view of lane lines that vehicle cameras use to find their way, Pavement lines and curbs, Dealing with human drivers, Consumer acceptance etc.
- Quote the Uber incident of March 2018 and elaborate on the ethical issues and concerns involved such as – responsibility of the accident, can machines make ethical decisions?, law aspects, life and death etc.

Conclusion –

Conclude with what needs to be done?

Introduction:

- Self-driving vehicles are cars or trucks in which human drivers are never required to take control to safely operate the vehicle. Also known as autonomous or “driverless” cars, they combine sensors and software to control, navigate, and drive the vehicle.
- They use technologies like **radar, Lidar, sonar, GPS, odometry and inertial measurement units**. Advanced control systems interpret sensory information to identify appropriate navigation paths, as well as obstacles and relevant signage. Long distance trucks are seen as being in the forefront of adopting and implementing the technology.

Body:

The Ethical concerns involved with Autonomous vehicles are:

- **Decision making:**
 - Google, Tesla and other major companies aim to make driverless cars a reality, which they suggest could reduce accidents caused by human error.
 - However, fatal accidents that such autonomous vehicles have already experienced — such as the deadly collision in May 2018 of a self-driving Uber car with a pedestrian — suggest they will not only need to navigate roads, but potentially also the dilemmas posed by accidents with unavoidable deaths.
 - For example, should a driverless car hit a pregnant woman or swerve into a wall and kill its four passengers?

- **Accountability:**
 - In the case of any crash, it would arise issue of accountability whether car owner would be accountable or the manufacturer of that vehicle
- **Law vs Ethics:**
 - Autonomous cars are made to follow traffic rules strictly. But sometime traffic rules have to be compromised.
 - For example when a critical patient have to be taken to hospital. Some traffic rules like speed restrictions, breaking traffic signal in less traffic have to be broken to save the life.
- **Displaying human values:**
 - When the vehicle finds an injured person or an old lady, will it stop to help them and display the qualities of compassion and empathy?
 - will it stop by an accident and act as a good samaritan if need arises
 - Whether robots can amicably adapt to the human environment where interaction between the passenger and driver would be minimum may arise issue of developing companionship, cooperation, bonding which use to be with the human being.
- **Impacts on Environment:**
 - This will promote vehicle usage at a time when the objective is to reduce vehicles to reduce green house gas emissions
- **Livelihood of drivers:**
 - Job loss to drivers without compensatory skill development and job creation.
 - It is believed that in coming future automation will kill 69% of the job

Conclusion:

- The autonomous vehicles have been pegged to revolutionize the driving experience of passenger and have utility over vice like in case of safety of passenger. Any use of this emerging technology must be carefully used keeping in mind its ethical concerns in mind.

Q) Discuss the Impact of the Internet on our Daily Life, what are its Pros and Cons ? Elaborate. (250 words)

[Livemint](#)

Why this question:

The question is straightforward and is about analyzing the pros and cons of Internet.

Key demand of the question:

The answer must discuss the impact of use of internet on human beings.

Directive word:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief on what is internet.

Body:

- Discuss – How does the Internet affect people's lives? – Internet impact on society is now making economic, social, and political changes around the globe.
- What are the side effects of Internet? – Emotional Symptoms of Online Addiction; Feelings of guilt, Anxiety, Depression, Dishonesty, Euphoric feelings when in front of the computer, Unable to keep schedules, No sense of time, Isolation Etc.
- Discuss who all it affects and how?
- What needs to be done to utilize it in the best possible way without much of disadvantage.

Conclusion:

Conclude with a way forward.

Introduction:

- Internet as part of the history is the most important invention around the world which connects people through phones, satellites and cables.

- People all over the world have access to it as it is everyday usage, and internet becomes globally real and in demand. The maximum effect of the internet is actually on the daily life of the individuals because indeed there is no aspect of life which is not influenced by the internet and its uses.

Body:

Impact of Internet:

Pros:

- Information technologies have wrought fundamental change throughout society, driving it forward from the industrial age to the networked era. In our world, **global information networks are vital infrastructure**.
- The Internet has changed business, education, government, healthcare, and even the ways in which we interact with our loved ones—it has become one of **the key drivers of social evolution**.
- Online, the conventional constraints of space and time disappear and there is a dizzyingly wide range of communicative possibilities. The impact of social media applications has triggered discussion of the **“new communication democracy.”**
- The **right utilization of Internet power is challenging for governments across the world**. Government expenses are reduced due to providing data and information for people on the government websites. People are taking advantages of Government policies and websites. Any government information and service are easily accessible for the citizens. Using tools such as Right to Information, we can have online access to important government documents.
- The Internet is one of the key factors **driving today’s economy**. Even in a tough macroeconomic framework, the Internet can foster growth, coupled with enhanced productivity and competitiveness.
- The Internet has clearly **impacted all levels of education** by providing unbounded possibilities for learning. I believe the future of education is a networked future. People can use the Internet to create and share knowledge and develop new ways of teaching and learning that captivate and stimulate students’ imagination at any time, anywhere, using any device.
- The most interesting aspect of the internet influencing our daily lives is the factor of **entertainment**. Entertainment no longer demands your money or expense, today you can just log on the internet in your free time and get involved talking to people of similar interests, or watch movies or play games, its all there in the internet.
- The development of information and communication technologies and the wide-ranging effects of globalization are changing what we are, and the meaning of cultural identity. The concepts of space, time, and distance are losing their conventional meanings. **Cultural globalization** is here, and a global movement of cultural processes and initiatives is underway.
- The Internet revolution is not just technological; it also **operates at a personal level**, and throughout the structure of society. The Internet makes it possible for an unlimited number of people to communicate with one another freely and easily, in an unrestricted way.

Cons:

- A key issue surrounding Internet use is **privacy**. Internet users are becoming more sensitive to the insight that privacy is a must-have in our lives. It’s very tough even for the government of various countries to protect user’s privacy.
- The biggest challenge for the society to do mobile banking and cashless transactions. Because the **data is compromised** by such companies and there is no guarantee that you’re safe or not.
- Much of the time, people started to use social media with no real idea of the dangers, and have wised up only through trial and error—sheer accident, snafus, and mistakes. Lately, inappropriate use of social media seems to hit the headlines every day
- Internet has given rise to **cyber crime** of which mostly teenagers and youngsters become the victim. We all hear in our day to day life about these cases for eg. Leaking someone’s private clips or pictures on internet just for the sake of jealousy or taking revenge or for hacking.
- The Internet is **creating robotic societies**. A society with hybrid skills doing like, comments but doesn’t have feelings and own impact on his/her social shares.
- The Internet is also helping the polarization of the society by dividing the unity of people by **producing communalism and casteism material on the internet**. Producers of communalism and casteism in the society never develop the society.
- If technology can replace a task, we will rely on it rather than exercise our mental faculties. So, the tech giants will give birth to a “reliance economy”.

**Conclusion:**

- Today almost all the things are connected and working through the Internet. There should be no doubt that Internet is becoming the engine of every new invention.
- No matter how bad society is influenced by the internet, but education of people can play a role in right usage of Internet. The role is not defined by algorithms, it is defined by our parents, teachers and after self-analysis.

Q) Breaking down the boundaries guarding our privacy ? Debate the benefits these technologies offer with respect to the data breaches they make. (250 words)

Livemint

Why this question:

The article captures the debate of pros and cons that Internet of things bring to us. It analyses the issue of data privacy and surveillance of the IoT. One has to weigh the pros and cons for the same.

Key demand of the question:

The answer must argue in detail for and against the Internet of things, one has to analyse the positives and negatives of the IoT.

Structure of the answer:

Introduction:

Briefly explain the concept of Internet of Things and how Internet of things has been a buzzword in today's fast-paced world. Internet of things is a core technology in today's era.

Body:

Body of the answer should discuss the following aspects:

- Start by explaining what are the benefit of Internet of things?
- Discuss the three of the main concerns that accompany the Internet of Things are the breach of privacy, over-reliance on technology, and the loss of jobs.
- Aspect of Privacy and security – In today's tech-driven world, each and every device that an individual uses is connected via the internet. This increases the risk of any leakage of data that might be important. This is a major drawback of sharing information, as confidential information might not be safe & could be hacked by third parties easily.
- Present points on how it proves to provide an unpermitted data surveillance breaching boundaries of privacy.
- Conclude as to what can be the way ahead.

Conclusion:

Conclude with measures to prevent such data breach and what can be the way forward with it.

Introduction:

- Internet of things is an integrated system in which devices are connected in a network of information in such a way that they can communicate with each other without any human intervention. It creates an intelligent system of systems which can manage multiple activities of human concern like traffic control, health management, optimal use of electricity and inventory management etc.

Body:

Benefits offered by IoT technologies:

- **Unprecedented connectivity:** IoT data and insights from connected applications and devices empower organizations with the ability to deliver innovative new products and services faster than their competitors.
- **Increased efficiency:** IoT networks of smart and intelligent devices provide real-time data to arm employees with the information they need to optimize their day-to-day efficiency and productivity.
- **Cost savings:** IoT devices provide accurate data collection and automated workflows to help organizations reduce their operating costs and minimize errors.
- **Time savings:** Connected smart devices can help organizations enhance the performance of systems and processes to save time.

However, the challenges posed by IoT are critical:

- More than 7 billion devices will need to be made secure by their manufacturers before 2020.
- The need to secure every connected device by 2020 is "critical".
- IoT botnets, created using a network of out-of-date devices took large websites and services offline in 2016.
- Everything that's connected to the internet can be hacked, IoT products are no exception to this unwritten rule. (Remember the car hacking scene in the 'Fate of the Furious' movie).

- If every product becomes connected then there's the potential for unbridled observation of users. This will create a lot of privacy issues.
- In today's tech-driven world, each and every device that an individual uses is connected via the internet. This increases the risk of any leakage of data that might be important. This is a major drawback of sharing information, as confidential information might not be safe & could be hacked by third parties easily.
- IoT devices collect and share personal data in real-time, thus raising concerns on protecting personal information and privacy.
- There is growing concern about the potential for increased government surveillance and a resulting encroachment of civil rights to suppress dissent or marginalise communities.
- Additionally, the annual cost of cybercrime is over \$1 trillion.
- Since the IOT is capable of processing the tremendous amount of real-time data, it is possible for hackers and miscreants from accessing and manipulating those data.
- Also, several regulations across the world indicate that IoT companies need to collect user consent prior to collecting the said data.
- However, there is a debate around how best to communicate and receive consent for personal data collected.
- In the future, intelligence services might use the internet of things for identification, surveillance, monitoring, location tracking, and targeting for recruitment, or to gain access to networks or user credentials.

Conclusion:

- Policy-makers, regulators, device manufacturers, supporting industries and service providers will all have to join hands in creating a safer space online.
- We need to upgrade our laws to appropriately account for the impact that IoT will have on our lives.
- The Justice Srikrishna Committee had recommended some provisions for personal data protection including a consumer's right to information, consent, and right to request companies to erase their data if preferred.
- However, it leaned heavily towards greater regulations and did not specify how to protect consumer data from unnecessary government surveillance.
- Despite these challenges, India must drive full speed ahead towards IoT technology for the greater good of our citizens.
- With effective global alliances and Indian stakeholder alignment, we can work to create more secure devices and help our citizens.

Q) With RISAT-2B, India has resumed its course back on radar imaging space fleet, discuss its significance elucidating upon its application across the domains. (250 words)

[Economictimes](https://economictimes.india.com/news/technology/space/isro-launches-risat-2b-satellite-6848481)

Why this question:

In a pre-dawn launch on Wednesday, Indian space agency ISRO scripted history by successfully launching earth observation satellite RISAT-2B that would enhance the country's surveillance capabilities among others.

Key demand of the question:

The answer must discuss in detail significant features of RISAT- 2B and importance it brings to India in terms of radar imaging space fleet. One must list out in detail the application aspects of such a mission.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines on RISAT – 2B.

Body:

Answers must discuss the following aspects :

- The salient features of the satellite launch – RISAT -2B
- What are its capabilities?
- Why is the mission important to India?
- What are the applications it brings – in the fields of – agriculture; crop estimation, forestry, soil, land use, geology and during floods and cyclone.

- Its significance to security forces and disaster relief agencies etc.

Conclusion –

Conclude with significance of such a mission to India.

Introduction:

- RISAT-2B, the country's newest microwave Earth observation satellite, rode to its orbit 557 km above the ground. Dubbed as a '**spy**' satellite, RISAT-2B (Radar Imaging Satellite-2B) will replace its predecessor RISAT-2 which has been actively used by India to monitor activities in terror camps across the border in Pakistan to thwart infiltration bids by terrorists.

Body:

Significance of RISAT-2B:

- RISAT-2B adds to India's capability to observe the earth in all weathers and all conditions.
- Regular remote-sensing or optical imaging satellites work like a light-dependent camera that cannot perceive hidden or surreptitious objects in cloudy or dark conditions.
- Satellites that are equipped with an active sensor, the synthetic aperture radar (SAR), can sense or 'observe' Earth in a special way from space day and night, rain or cloud.
- A radar imaging satellite is complex to assemble. Interpreting its images is equally complex.
- It will mark the resumption of a vital ring of Indian all-seeing radar imaging satellites after seven years.
- It will add to the reconnaissance capability from about 500 km in space. A constellation of such space-based radars means a comprehensive vigil over the country.
- It will enhance India's monitoring capabilities for civil and military purposes.

Applications of RISAT-2B:

- Radar imaging is important for surveillance applications, as it does not require sunlight or clear skies to be able to observe its target.
- Providing data for national security agencies.
- crop monitoring during the monsoon season
- forestry mapping for forest fires and deforestation
- flood mapping as part of the national disaster management programme

Conclusion:

- The satellite will enhance India's capability in crop monitoring during the monsoon season, forestry mapping for forest fires and deforestation, and flood mapping as part of the national disaster management programme.
- The biggest advantage is that ground imageries can be collected during rains and despite dust, clouds or darkness and during all seasons, thus ensuring continuous and reliable data.

Q) “The fear of AI and autonomous machines as a threat to humanity is misguided.” Critically analyse the statement with respect to the Indian Scenario. (250 words)

Livemint

Why this question:

The article captures effects of digitization on Jobs, it critically analyses whether Artificial intelligence and autonomous machines create or take away Jobs of humans.

Key demand of the question:

The answer must debate about the consequences of AI and machines on current Jobs and employment scenario.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In a few introductory lines quote some relevant facts to highlight the mixed effect of AI and machines on jobs and employments as of now.

Body:

- First discuss how artificial intelligence (AI) and robotics are being seen to replace human beings in all kinds of jobs.
- Discuss the past Industrial revolutions; how they only improved the Jobs and never failed employment scenario in terms of mass jobs, better technology etc.
- The more likely scenario is humans and robots working in harmony. AI expands the potential of humans. Humans will learn value-added tasks, while self-learning robots pick up new skills on their own.
- Digitalization will transform work with people having higher qualification and competence profiles but won't replace it: people will always be indispensable. Digitalization will create more jobs than it takes away.
- Have a section discussing Indian scenario – what needs to be done?
- Conclude with way forward.

Conclusion:

Conclude with importance of a balance between the two.

Introduction:

- AI and autonomous machines threaten 69 per cent of the jobs in India, while 77 per cent in China, according to a World Bank research which has said that technology could fundamentally disrupt the pattern of traditional economic path in developing countries.
- The fear of AI and autonomous machines as a threat to humanity is misguided. The more likely scenario is humans and robots working in harmony. AI expands the potential of humans.

Body:

The increasing threatening to jobs by artificial intelligence (AI) and robotics:

- Various automation technologies are in the process of overhauling the mass employment-generating but low skilled blue-collar labour markets. They could also threaten skilled white-collar workers.
- For instance, JP Morgan Chase and Co. developed a programme called COIN, a learning machine that interprets legal agreements in just a few seconds, a task that consumed 3, 60,000 work hours for lawyers and loan officers annually.
- Similarly, an American medical school tested IBM's AI technology Watson to analyse 1,000 cancer diagnoses. In 99% of the cases, Watson was able to recommend treatment plans that matched the suggestions of well-renowned oncologists.
- As the world gets more competitive, as manufacturing gets more competitive, it will use more automation, robotics, technology.
- New technologies like AI and Robotics improve the functional efficiency drastically than manual methods. Thus large industries will increasingly shift towards the automation in the quest of higher productivity.
- Information technology (IT), IT-enabled services (ITeS) and security services, followed by banking, will be the first sectors to feel the heat, wherein manual transactions and processing jobs will become obsolete.

- Huge numbers of services jobs in these sectors will be made redundant as a few lines of code will be able to perform the same tasks efficiently and effectively, according to PeopleStrong (HR solution firm).
- Increasing Automation also reduces the proportion of creation of new jobs. This could hurt India in longer run.

However, the fear is not true:

- Impact of Automation will be felt where the jobs cost the highest in the next 10-15 years. If India grows at 8% a year, with a labour productivity increase of 1.5% a year, jobs should grow at a rate of 6.5% a year. With automation, jobs may grow within a band of 4-5% a year for the next 10 years.
- Accenture said AI has the potential to increase India's annual growth rate of gross value added (GVA) by 1.3 percentage points, lifting the country's income by 15 percent by 2035.
- The cost of initial automation and robotics is high. In a country where wages are much lower than such costs, impact will be felt at a slower pace and much less than elsewhere.
- Further increasing Automation may not affect Indian agriculture due to factors like land fragmentation and dominance of small and marginal farmers.
- Creating AI portal will help the nation to create more jobs as Artificial Intelligence, Machine learning, Robotics and the integration of Machine learning with Biological sciences where the graduates can play an important role in the future.
- The establishment of the National Centre of AI as a hub along with centres of excellence and identification of Nine priority areas is a step in the right direction.
- The digital infrastructure in the digital economy of 2030 can be built upon successes achieved in recent years in digitisation of government processes and private transactions

Potential areas for AI applications in India:

- It can complement Digital India Mission by helping in the big data analysis which is not possible without using AI.
- Targeted delivery of services, schemes, and subsidy can be further fine-tuned.
- Smart border surveillance and monitoring to enhance security infrastructure.
- Weather forecasting models may become proactive and therefore preplanning for any future mishaps such as floods, droughts and therefore addressing the farming crisis, farmer's suicide, crop losses etc.
- By analyzing big data of road safety data and NCRB (National Crime Record Bureau) data for crimes, new policies can be formulated.
- Disaster management can be faster and more accessible with the help of robots and intelligent machines.
- In the counterinsurgency and patrolling operations, we often hear the loss of CRPF jawans which can be minimized by using the robotic army and lesser human personnel.
- AI can be used to automate government processes, therefore, minimizing human interactions and maximizing transparency and accountability.
- It can be applied to study ancient literature upon medicines and therefore help in modernizing the health care with the juxtaposition of modern machines and ancient techniques.
- In the remotest areas where the last leg of governance is almost broken, AI can do the job. For Example: in the tribal areas and the hilly areas of the northeast.

Way forward

- Ensure interpretability of AI systems:
 - Decisions made by an AI agent should be possible to understand, especially if they have implications for public safety or result in discriminatory practices.
- Empower users:
 - The public's ability to understand AI-enabled services, and how they work, is key to ensuring trust in the technology.
- Responsible deployment:
 - The capacity of an AI agent to act autonomously, and to adapt its behaviour over time without human direction, calls for significant safety checks before deployment and ongoing monitoring.
- Ensure accountability:
 - Legal certainty and accountability has to be ensured when human agency is replaced by the decisions of AI agents.
- Consider social and economic impacts:
 - Stakeholders should shape an environment where AI provides socioeconomic opportunities for all.

- Open Governance:
 - The ability of various stakeholders, whether in civil society, government, private sector, academia or the technical community to inform and participate in the governance of AI is crucial for its safe deployment.

Q) Discuss the major objectives of Mission Gaganyaan – India's maiden human spaceflight programme. (250 words)

[Timesofindia](https://timesofindia.com)

Why this question:

The Indian Air Force (IAF) has signed a Memorandum of Understanding (MoU) with Indian Space Research Organisation (ISRO) for astronaut selection and training for ambitious Gaganyaan Programme, scheduled for 2022.

Key demands of the question:

The answer is straightforward and must discuss the mission in detail – objectives, significance and way forward.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start by bringing out the highlights of the mission.

Body:

Answer to the question the straightforward, In brief discuss the detailed objectives of Gaganyaan Mission, Gaganyaan Mission is India's maiden human spaceflight programme, scheduled for 2022.

Conclusion:

Conclude with significance of the mission and state its importance.

Introduction:

- Mission Gaganyaan is India's first Human Space Flight Programme to be launched by Indian Space Research Organisation (ISRO) by 2022. The programme will make India the fourth nation in the world to launch a Human Spaceflight Mission. So far, only the USA, Russia and China have launched human spaceflight missions.

Body:

Objectives of the Mission:

- Enhancement of science and technology levels in the country
- A national project involving several institutes, academia and industry
- Improvement of industrial growth
- Inspiring youth
- Development of technology for social benefits
- Improving international collaboration

Relevance of a Manned Space Mission for India:

- **Boost to industries:** The Indian industry will find large opportunities through participation in the highly demanding Space missions. Gaganyaan Mission is expected will source nearly 60% of its equipment from the Indian private sector.
- **Employment:** According to the ISRO chief, the Gaganyaan mission would create 15,000 new employment opportunities, 13,000 of them in private industry and the space organisation would need an additional manpower of 900.
- **Technological development:** Human Space flights are frontier field in the science and technology. The challenges the Human Space Flights provide to India, and the benefits accruing from taking up those missions will be very high and will lead to further thrust for technological developments in India
- **Spurs research and development:** It will boost good research and technology development. With a large number of researchers with proper equipment involved, HSF will thrust significant research in areas such as materials processing, astro-biology, resources mining, planetary chemistry, planetary orbital calculus and many other areas

- **Motivation:** Human space flight will provide that inspiration to the youth and also the national public mainstream. It would inspire young generation into notable achievements and enable them to play their legitimate role in challenging future activities
- **Prestige:** India will be the fourth country to launch human space mission. The Gaganyaan will not only bring about prestige to the nation but also establish India's role as a key player in the space industry

Way forward:

- It is important to ensure engagements at political level to obtain long term commitment for India's human space flight missions
- Financial implications of a long-term human space-flight programme development should be assessed and the returns and benefits should be clearly articulated
- It is important to overcome the technological challenges to ensure a safe, successful manned space mission. International collaboration in this domain can help India ensure a robust technology for its HSF programme.
- Selection of Indians for astronauts will be an important step. Procedures and specifications for astronauts and a rigorous selection process is suggested.

Topic: Awareness in the fields of IT, Space, Computers, robotics, nanotechnology, biotechnology and issues relating to intellectual property rights.

Q) "Space start-ups are the new sunrise industry". Comment. (250 words)

The hindu

Why this question:

The question is in the backdrop of the coming of NewSpace India Ltd. (NSIL) as a commercial entity of Department of space along with the existing Antrix – the commercial arm of Indian department of space.

Demand of the question:

This question seeks to examine the coming of space start ups as the new sunrise sector. In the last few years India has witnessed a boom and more than a dozen space focused startups have emerged. In such a scenario the coming of commercial arms makes a difference. One has to suggest and highlight the importance of such entities.

Directive word:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction

Start with brief introduction of the space industry in India.

Body

Discuss the following points in detail:

- Background – In February 2019, the Union Cabinet had cleared a new business arm for Department of Space (DoS). On March 6, 2019, the DoS registered NewSpace India Ltd. (NSIL) as its commercial entity.
- NSIL is the second commercial entity of the Department of Space (DoS) after Antrix Corporation Limited, which was set up in 1992 to market the products and services of the Indian Space Research Organization (ISRO).
- What is the mandate of NSIL ? how will it effect space industry ?
- Significance of Space startups in Indian scenario.

Conclusion

Conclude with way ahead.

Introduction:

- The Indian space program was established with a very different goal in mind. Unlike its western counterparts where the space industry began and evolved due to military expenditure during the Cold War, the Indian space program mainly focused on achieving self-reliance that would help solve the problems of the nation.
- The Indian space program dates back to 1969, when the Indian Space Research Organization (ISRO) was established. Since then, the Indian space program has come a long way. In 2018, the 100th satellite launched helping India establish itself as one of the fast-rising space nations around the world. Still, India's share of the global \$400 billion space market is less than 0.01%. The private space sector has recently started to take shape in India with some of these companies influencing the global space industry.

**Body:**

- The Department of Space (DoS) in India has registered its second commercial entity, **NewSpace India Ltd. (NSIL), in Bengaluru**. DoS already has a commercial venture, **Antrix Corporation Limited**, which was set up in September 1992 to market the products and services of the Indian Space Research Organisation (ISRO).

Mandate of NSIL:

- Newspace India will market space-based products in the country and abroad.
- It aims to commercially exploit the research and development work of the space agency.
- This includes the small satellite programme, the small satellite launch vehicle (SSLV) programme and the polar satellite launch vehicle (PSLV) and lithium-ion cells etc.
- The entity will be a link between ISRO and the industry and help transfer its technologies to private firms for a fee.
- Newspace India will play a different role since Antrix is solely involved in commercial launches of foreign satellites

Significance of Space startups in Indian scenario:

- There are over a thousand space startups all around the world. India's share of these startups remains less than 1%.
- Indian Space Research Organization (ISRO) is increasingly looking for collaboration with the private sector to increase the number of satellites, explore more research-related opportunity areas and to overcome manpower and budgetary constraints.
- ISRO plans to double the number of satellites launched in the next two years and this would necessitate active involvement and participation of the private sector.
- The current manpower of ISRO is less to meet the increasing demands of satellite launches and the heightened expectations that will arise, and hence the involvement of the emerging private sector becomes crucial.
- In the past two decades, through a combination of technology, policy, and will, governments of more than a dozen countries have successfully transferred many space operations to the private sector and it has yielded good results.
- Collaboration with private players is vital for capacity building, cost reduction and getting an extra mile cutting-edge advantage.
- Since ISRO is making a lot of satellites, and a large chunk of its manpower is involved in manufacturing and launch vehicles, so active involvement of the private sector would also mean that ISRO can devote more time to core research.
- With the introduction of the **new Space Activities Bill**, the Indian government has also opened up opportunities for the private sector and made it much easier for them to sustain and thrive.
- The principal propellant of growth in the private space sector would be the medium and small industries because the big industries focus mainly on system integration.
- With initiatives such as Make in India, Digital India, and Startup India, the government has been able to push the startup sector. What is now needed is to frame a program exclusively for space startups that will benefit the space entrepreneurs and help them make an impact in the space industry.

Potential advantages of rising Space industry:

- Adding an edge to India's foreign policy as our space capabilities can be a part of our initiatives to foster new relationships,
- Avoiding the outflow of tax-payer's money to foreign hands from where we procure turnkey products and services,
- Creating more opportunities for foreign direct investments (FDI), as well as new jobs for highly-skilled labour market,
- Empowering India's defence system by equipping it with space technology, and allowing armed forces to procure defence products and services indigenously, and
- Reversing the brain-drain from India.

Conclusion:

- To thrive in this throttling competition and be head-and-shoulders above others in the same segment, innovative research has to be fostered and dynamic players have to be brought onboard. This is not possible without engagement, collaboration, partnership and devolving some of the roles to the private industry

Extra Information: Indian space SME industry is valued at just \$48 million but is expected to expand at a quick pace. Some of the **space-related Indian startups** that are already making a mark in the market are:

- A small satellite developer **Dhruva Space** joined hands with a German company called the Berlin Space Technologies last year to establish India's first factory to manufacture satellites for non-telecom commercial applications such as disaster management, vehicle and flight tracking, predictive analytics and imaging. It aims to manufacture 10 to 12 satellites every year.
- **Team Indus**, an aerospace startup, won \$1 million prize in the Google Lunar XPrize competition in the 'Landing Milestone' category. It was the only Indian team to compete in the competition where different teams had to land a robot on the moon by December 2016.
- **Antara Space** signed a satellite procurement agreement with the UK's Dauria Aerospace in July 2014 to develop two small geostationary communication satellites for broadcasters.
- **Earth2Orbit** is India's first private space startup that offers earth observation products and launch facilitation services to different companies.
- With the launch of ExseedSAT 1, **Exseed Space** has become the first Indian privately-funded startup to successfully send a satellite into space.

Q) What are space debris? How are they a threat to space operations? Discuss the concerns associated with Mission Shakti with respect to space debris. How far do you think the concerns are just? Comment. (250 words)

Reference

Why this question:

The article discusses in detail the significance of mission shakti to India. The question thus is to analyse the concerns of space debris and the issues surrounding and questioning the utility of space mission shakti.

Key demand of the question:

Answer must provide for an analysis of Mission Shakti, its effects on space debris and weigh the merits and demerits of the mission.

Directive word:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In a few introductory lines highlight the context of the question.

Body:

- In brief discuss what you understand by Space debris? – Initially, the term space debris referred to the natural debris found in the solar system: asteroids, comets, and meteoroids. However, with the 1979 beginning of the NASA Orbital Debris Program, the term also refers to the debris from the mass of defunct, artificially created objects in space, especially Earth orbit.
- Discuss why are they harmful?
- Salient features of mission shakti.
- What is the debate of space debris and mission shakti?
- How are space debris a threat to human life?
- What needs to be done?

Conclusion:

Conclude with way forward.

Introduction:

- India recently announced that it had carried out a successful anti-satellite missile test (ASAT), Mission Shakti. ASAT is the technological capability to hit and destroy satellites in space through missiles launched from the ground.

Body:

Space Debris:

- Space debris is a term for the mass of defunct, artificially created objects in space, most notably in Earth orbit, such as old satellites and spent rocket stages.
- It includes the fragments from their disintegration, erosion and collisions.
- Sources of space debris are dead spacecrafts, lost equipment, boosters, weapons etc.

- Space debris has become a pressing issue, with objects in orbit flying out of control, posing a risk to satellites and to astronauts.
- The drive to keep space debris at bay is growing as more satellites are launched.
- According to the European Space Agency, there were an estimated 7,50,000 objects of size one cm or above in space.

Threats posed by Space Debris:

- Space junk is a threat to active satellites, unmanned spacecrafts and spaceships.
- International space station: Although the ISS uses Whipple shielding to protect itself from minor debris, portions (notably its solar panels) cannot be protected easily.
- There is also the risk, known as the Kessler Syndrome or Kessler Effect, where one piece of debris breaks off and hits another so that it becomes a cascade, which could end up polluting an entire orbit for satellites.
- Earth: Although most debris burns up in the atmosphere, larger objects can reach the ground intact. According to NASA, an average of one catalogued piece of debris has fallen back to Earth each day for the past 50 years

Concerns associated with Mission Shakti with respect to space debris:

- Mission Shakti's technology is aimed at destroying, if necessary, satellites owned by enemy countries.
- A satellite that is destroyed by a missile disintegrates into small pieces, and adds to the space debris.
- g. China carried out its first anti-satellite missile test in 2007, destroying its Fengyun-1C weather satellite. This created more than 2,300 large pieces of space debris, and an estimated 1.5 lakh pieces of objects that were larger than 1 cm in size.
- Each of them could render a satellite useless on collision, and the debris damaged a functional Russian satellite.
- But more than that, destroying space infrastructure like satellites is also taboo in the international community, at least till now.
- Almost every country agrees that space must not be used for wars and has spoken against weaponisation of space.

However, Mission Shakti is justified as:

- With large number of crucial applications being satellite-based, satellites are extremely critical infrastructure of any country these days.
- Some of them include navigation systems, communication networks, banking systems, weather forecasting, disaster management, and military applications.
- Destroying a satellite would render these applications useless.
- It can thus cripple enemy infrastructure without causing any threat to human lives.
- None of the international treaty or agreements technically prohibits the kind of test that India presently carried.
- By government statement, the Indian test was done in the lower atmosphere to ensure that there was no space debris.
- So whatever debris that is generated will decay and fall back on to the earth within weeks.

Way forward:

- The issues constraining the process of tackling space debris are financing and international cooperation.
- The question of who pays for these 'garbage collection' missions is also a tricky one.
- All these issues need resolution but countries need to act immediately to avoid any huge catastrophe due to inaction.
- Recently, a space mission named **Remove Debris** was launched to demonstrate various space debris removal technologies.
- Methods like **Net capture, Harpoon Capture, Vision-based navigation, De-orbiting process** can be used.
- **Self De-Orbiting Mechanism**, which can allow satellite to automatically go out of Earth's orbit, after it is of no use.
- **Supersonic Laser**, which can be use by placing it on Earth only, but it, will burn the space trash. These lasers have been put up in Australia.
- **Space Magnet**, which can attract small pieces of debris and throw it out from Earth's orbit.
- **Space Bombs**, which can burn the space junk, without harming any other satellites.

Q) Discuss the diverse applications of Biotechnology in India and analyse its growth potential with reference to initiatives taken by the government in this direction. (250 words)

Reference

Why this question:

The question is to assess the Biotechnology sector in India, its potential growth and initiatives taken by the government in this direction.

Key demand of the question:

The answer is straightforward and it must narrate upon the biotechnology sector of the country, its potential and significance.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines on what you understand by Biotechnology.

Body:

Answers must discuss the following aspects :

- Quote some facts of Biotechnology sector in India – Indian biotechnology sector has crossed the \$ 3 billion milestones and is growing at the rate of more than 30% over the last few years.
- Potential – India could even achieve the target of attaining \$20 billion by 2020.
- Discuss the notable trends of the sector in India.
- Explain the benefits of the sector in terms of everyday application in fields of science, Industry, agriculture, animal husbandry, human health etc.
- Conclude with pros and cons and how the pros should outweigh the cons of the technology.

Conclusion –

Conclude with significance of the Industry on economic and social fronts.

Introduction:

- Fifteen years after it rose and went limp, the biotech sector, globally, as well as in India has seen a bull run of sorts. In January this year, some 10 healthcare companies went public on the NASDAQ. Meanwhile, India has become the world's 12th biggest biotechnology economy having the second highest number of USFDA-approved plants. Biotechnology will help developing countries accomplish things that they could never do.

Body:

Indian Biotechnology Scenario:

- In India, the world's 12th biggest biotechnology economy and having the second highest number of US Food and Drugs Administration (USFDA) – approved plants, the industry is not only excited at the revival in the US but also about its domestic prospects.
- The Indian bioeconomy grew to \$4.3 billion at the end of the 2013 financial year, up from \$530 million in 2003, according to BioSpectrum, a widely-read trade publication in India.
- Though concentrated in Hyderabad and Bengaluru, there are units sprouting across the country; currently some 350 companies are in operation.
- The bio-pharmaceutical sector, which includes vaccines, medical devices and stem cells, is the main driver of India's biotechnology growth, generating close to 63 per cent of the industry's total revenue in 2013.

Biotechnology has the following relevance in India:

- **Applications of Biotechnology in Medicine**
 - Biotechnology techniques are used in medicine for diagnosis and treating different diseases. It gives opportunities for the people to protect themselves from dangerous diseases.
 - The field of Biotechnology, genetic engineering has introduced techniques like **gene therapy, recombinant DNA technology and polymerase chain reaction** which use genes and DNA molecules to diagnose diseases and insert new and healthy genes in the body which replace the damaged cells
 - Genetic modification in mosquitoes can solve the problems of epidemic diseases such as dengue and malaria
 - Artificial insemination is the artificial introduction of semen into the reproductive tract of a female animal. It is used extensively in breeding animals, such as sheep and cattle

- Medical researchers believe that stem cell therapy has the potential to dramatically change the treatment of human disease. A number of adult stem cell therapies already exist, particularly bone marrow transplants that are used to treat leukaemia.
- Stem cell transplantation was first used in the treatment of blood disorders and it was a breakthrough. Conventionally known as bone marrow transplantation, the stem cells responsible for production of the blood cells reside in the bone marrow
- **Applications of Biotechnology in Agriculture**
 - Biotechnology has played major role in agriculture by altering genes, studying and cloning various crops in order to provide better quality products of foods ultimately improving our lives.
 - Hybrid Seeds, Artificial Seeds, Photosynthesis improver, Stress resistant crops and plants, Bio-fertilisers, Bio-pesticides are some of the potential applications.
 - Potential advantages that biotechnology can confer across a wide range of agricultural applications are in areas such as livestock management, storage of agricultural products and sustaining current crop yields, while reducing the use of fertilizers, herbicides and pesticides.
 - Biotechnology offers a very promising alternative to synthetic foods and an improvement on conventional plant-breeding technologies. Combined with other advanced agricultural technologies, it offers an exciting and environmentally responsible way to meet consumer demand for sustainable agriculture.
- **Animal husbandry:**
 - The application of biotechnology in this area, in increasing production efficiency through manipulation and control of physiological systems and improving the health and well-being of animals, assumes great significance.
 - Embryo transplantation, used with cattle, goats, pigs, and sheep, aims to increase the number of offspring from a quality female.
 - Cloning embryos to artificially produce genetic duplicates of an animal has also become possible.
 - Direct manipulation and alteration of an animal's genetic material— genetic engineering—has the potential to produce even more drastic changes in animal breeding. It is believed that genetically altered pigs may one day be able to provide compatible organs for emergency transplantation (xenotransplantation) into humans.
- **Application of Biotechnology in Food Processing**
 - Biotechnology has a major application in the food sector.
 - Bread, cheese, wine, beer, yogurt, and vinegar are all made by culturing microorganisms and are really the oldest products of biotechnology.
 - It helps in improving the edibility, texture, and storage of the food; in preventing the attack of the food, mainly dairy, by the virus like bacteriophage.
 - Biotechnologists are also developing tests that will allow the detection of food-contaminating microorganisms and the toxins they produce, which may be present only in minute quantities.
 - Biotechnology also has applications in the detection of mutagens (substances that cause genetic mutations) in individual food products.
 - GM crops which have been approved for use in food items in select countries include corn, maize, soya, tomato, potato and papaya.
 - Latest innovations in biotechnology that fortify major staples with micro nutrients like vitamin A, zinc and iron can be game changers for hunger problem in India.
- **Environment:**
 - Biotechnology can be used to tackle environmental issues like deforestation and air pollution
 - Biotechnology can help in finding out the level of Particulate Matter 2.5 in the air,
 - Biotechnology is already providing a clean and renewable alternative to traditional fossil fuels, the burning of which contributes to global warming.
 - The benefit of environmental biotechnology helps us to avoid the use of hazardous pollutants and wastes that affect the natural resources and the environment.
 - Biosensors, which combine a biological component (such as an enzyme) with various electronic components to trigger a circuit when a particular type of chemical is detected. Biosensors are capable of detecting extremely low levels of proteins, hormones, pollutants, gases, and other molecules.

Government initiatives to boost the sector:

- The Ministry of Science and Technology, Government of India and RIKEN, Japan's largest research organisation have signed memorandums of understanding (MoU) to launch joint research programs in the fields of biology, life sciences and material sciences.
- UK Trade and Investment (UKTI) and the Association of Biotech Led Enterprises (ABLE) have signed a MoU to encourage and develop collaborative opportunities between Indian life sciences organisations and the UK.
- The Drugs Controller General of India has approved Biocon Ltd to market its biosimilar 'Trastuzumab' developed jointly with the US drug-maker Mylan, for treating breast cancer. "This is a major milestone for both partners as it is the world's first biosimilar trastuzumab to be accorded regulatory approval," said Ms Kiran Mazumdar Shaw, Chairperson and Managing Director, Biocon.
- The Government of India plans to set up National Institute of Biotic Stress Management for addressing plant protection issues will be established at Raipur, Chhattisgarh.

Conclusion:

- Every new drug discovery or drug approval not only draws cheers from millions of victims of debilitating diseases but also adds value to biotechnology companies. In a complex play of scientific progress and market forces, the biotechnology industry is recording growth that can rival the information technology industry boom of the 1990s. India with its young workforce and a potential market for the end-products can look out for a bright future in the biotechnology sector.

Q) Evaluate the contributions of Nano technology to the health Industry. (250 words)

Reference

Why this question:

The article highlights a research at Indian Institute of Technology-Mandi about a multifunctional gold nanostructure that has been developed and can be used in cancer imaging and therapy.

Key demand of the question:

The answer must discuss in detail the benefit that Nano technology has brought with it for the health industry.

Directive word:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer

Introduction:

write a few introductory lines on role of technology in Health Industry.

Body:

Answers to the question is straightforward, one has to suggest the benefits brought in by the Nano technology, use suitable examples to justify and conclude with significant breakthrough that the technology has got for the healthcare industry.

Conclusion –

Conclude with significance.

Introduction:

- Nanotechnology is the science of materials at the molecular or subatomic level. It involves manipulation of particles smaller than 100 nanometres (one nanometre is one-billionth of a metre) and the technology involves developing materials or devices within that size — invisible to the human eye and often many hundred times thinner than the width of human hair. The physics and chemistry of materials are radically different when reduced to the nanoscale; they have different strengths, conductivity and reactivity, and exploiting this could revolutionise medicine.

Body:

The contributions of Nanotechnology to the health Industry:

- **Diagnostics and screening:**
 - There is an urgent need in the developing world for better disease diagnosis, and nanotechnology offers a multitude of options for detecting disease.
 - Example: Fluorescent quantum dots could improve malaria diagnosis by targeting the blood cell's inner membrane.

- Similarly, carbon nanotubes, and other nanoparticles such as nanowires, have been used as biosensors to detect diseases such as HIV and cancer. Cancer biosensors can be made, for instance, by attaching nucleic acid probes to the ends of nanowires.
- **Drug delivery:**
 - Nanotechnology could also revolutionise drug delivery by overcoming challenges such as how to sustain the release of drugs in the body and improving bioavailability — the amount of active ingredient per dose.
 - Some drugs can now be delivered through ‘nanovehicles’.
 - For example liposomes, which can deliver the drug payload by fusing with cell membranes, have been used to encapsulate HIV drugs such as stavudine and zidovudine in vehicles ranging from 120 to 200 nanometres in size.
 - Nanocapsules are pods that encapsulate drugs, which ensures the drugs are released more slowly and steadily in the body
- **Health monitoring:**
 - Nanotubes and nanoparticles can be used as glucose, carbon dioxide and cholesterol sensors and for in-situ monitoring of homeostasis, the process by which the body maintains metabolic equilibrium.
 - In developing nations, the use of nanotechnology is also being explored in the fight against infectious diseases such as HIV and TB.
 - Nanoparticles could also be the basis for delivering an aerosol TB vaccine.
 - Needle-free, and therefore not requiring trained personnel to administer it, the vaccine is stable at room temperatures — important in rural areas that lack a reliable cold chain.
- **Vaccines:**
 - Nanotechnology could herald a new era in immunisation by providing alternatives to injectable vaccines for diseases that affect the poor.
 - Injectable vaccines need to be administered by healthcare professionals, who may be scarce in developing countries, particularly in rural areas.
 - Vaccines also need reliable refrigeration along the delivery chain. Scientists are working on an aerosol TB vaccine.
 - They are also investigating a nanotechnology-based skin patch against West Nile Virus and Chikungunya virus.
- **Tissue growth and regenerative medicine:**
 - Researches in tissue regenerative medicine aims in developing implants or scaffolds capable for delivering drugs, growth factors, hormones for tissue repair.
 - They provide sustained delivery of bioactive molecules to support survival, infiltration and proliferation of cells for tissue engineering.
 - The expected outcome of such treatment modality is to have complete tissue replacement and functional recovery.

Conclusion:

- Nanotechnology offers the ability to build large numbers of products that are incredibly powerful. Nanomedicines and nanodevices are in their early stages of development. The development processes are heavily intertwined with biotechnology and information technology, making its scope very wide. Nanotechnology based products are capable of overcoming the limitations of traditional methods. But, the major challenges are yet to prevail over its toxicity, environmental hazards, production cost and accessibility to the un-reachable at far-off areas.

Q) What do you understand by cloud computing ? List down the Advantages and limitations of Cloud Computing. (250 words)

Reference

why this question:

The question is based on the concept of cloud computing and its application on daily life.

Key demand of the question:

Answer is straightforward and is about discussing the concept of cloud computing, one must discuss in detail What Is Cloud Computing? What are the benefits and applications of it.

Structure of the answer:

Introduction:

In a few introductory lines highlight the context of the question.

Body:

- In brief discuss what is cloud computing? – Cloud computing is the delivery of different services through the Internet. These resources include tools and applications like data storage, servers, databases, networking, and software.
- Cloud computing is named as such because the information being accessed is found remotely in the cloud or a virtual space. Companies that provide cloud services enable users to store files and applications on remote servers and then access all the data via the Internet. This means the user is not required to be in a specific place to gain access to it, allowing the user to work remotely.
- Discuss types of cloud computing.
- Give out – what are the key takeaways of cloud computing, merits and disadvantages if any.

Conclusion:

Conclude with way forward.

Introduction:

- Cloud computing is the delivery of computing services—including servers, storage, databases, networking, software, analytics, and intelligence—over the Internet (“the cloud”) to offer faster innovation, flexible resources, and economies of scale.

Body:

In general, there are three cloud computing characteristics that are common among all cloud-computing vendors:

- The back-end of the application (especially hardware) is completely managed by a cloud vendor.
- A user only pays for services used (memory, processing time and bandwidth, etc.).
- Services are scalable

It is common to categorize cloud computing services as infrastructure as a service (IaaS), platform as a service (PaaS) or software as a service (SaaS)

Advantages:

- **Seamless Connectivity:** Cloud-based software offers companies from all sectors a number of benefits, including the ability to use software from any device either via a native app or a browser. As a result, users can carry their files and settings over to other devices in a completely seamless manner.
- **Higher Accessibility:** Cloud computing is far more than just accessing files on multiple devices. Thanks to cloud computing services, users can check their email on any computer and even store files using services such as Dropbox and Google Drive.

- **Improved Disaster Recovery:** Cloud computing services also make it possible for users to back up their music, files, and photos, ensuring those files are immediately available in the event of a hard drive crash.
- **Cost-Saving:** It also offers big businesses huge cost-saving potential. Before the cloud became a viable alternative, companies were required to purchase, construct, and maintain costly information management technology and infrastructure.
- Companies can swap costly server centers and IT departments for fast Internet connections, where employees interact with the cloud online to complete their tasks.
- The cloud structure allows individuals to save storage space on their desktops or laptops.
- **Increased Collaboration and flexibility:** It also lets users upgrade software more quickly because software companies can offer their products via the web rather than through more traditional, tangible methods involving discs or flash drives.
- For example, Adobe customers can access applications in its Creative Suite through an Internet-based subscription. This allows users to download new versions and fixes to their programs easily.
- **Environmentally friendly:** Cloud computing reduces a company's carbon footprint by minimizing energy consumption and carbon emissions by more than 30%. For small businesses, the decreased energy usage can reach up to 90% = A huge money saver.

Limitations:

- With all of the speed, efficiencies, and innovations that come with cloud computing, there are naturally risks.
- **Security** has always been a big concern with the cloud especially when it comes to sensitive medical records and financial information.
- While regulations force cloud computing services to shore up their security and compliance measures, it remains an ongoing issue. Encryption protects vital information, but if that encryption key is lost, the data disappears.
- Servers maintained by cloud computing companies may fall victim to natural disasters, internal bugs, and power outages, too.
- The geographical reach of cloud computing cuts both ways: A blackout in California could paralyze users in New York, and a firm in Texas could lose its data if something causes its Maine-based provider to crash.
- As with any technology, there is a learning curve for both employees and managers. But with many individuals accessing and manipulating information through single portal, inadvertent mistakes can transfer across an entire system.
- **Maintenance costs:** While the upfront or capital cost for the cloud-based server is very low compared to traditional hosting, the cloud server requires the same amount to be paid each month to maintain both servers as well as data.
- **Internet connectivity:** For cloud-based services, consistent internet connection is important because if any one of the cloud-based service providers loses connectivity, then the company will be out of business until that internet connection returns.
- A common argument from critics is that cloud computing cannot succeed because it means that organizations must **lose control of their data**, such as an email provider that stores data in multiple locations around the world. A large regulated company, like a bank, might be required to store data in the United States.

Conclusion:

- Cloud computing proponents point to it being a new paradigm in software development, where smaller organizations have access to processing power, storage and business processes that were once only available to large enterprises. It has immense potential in the field of E-governance, Telecom, Banking, Manufacturing and other sectors.

Q) What do you understand by Biotherapeutic medicines ? Elaborate on the need for guidelines to regulate the accessibility and affordability of this new class of medicines. (250 words)

The hindu

Why this question:

The article discusses in detail upon the need for revision of guidelines for Biotherapeutic medicines.

Key demand of the question:

The answer must discuss in detail what are Biotherapeutic medicines, why is there a need to revise the guidelines for the same and what needs to be done.

**Directive word:**

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

In a few introductory lines explain what are Biotherapeutic medicines.

Body:

- Biotherapeutic medicines, also known as biologics, are produced through biological processes and differ from the older generation small-molecule medicines that are derived through chemical synthesis.
- What are the issues surrounding it? – pricing, manufacturing, access, affordability, regulations etc.
- Discuss what needs to be done?
- Explain the Indian industry scenario.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- Biotherapeutic Medicines (also known as biologics) are medicines whose active ingredients are or are derived from proteins (such as growth hormone, insulin, antibodies) and other substances produced by living organisms (such as cells, viruses and bacteria).
- They are larger and more complex than chemically-synthesized medicines and their characteristics and properties are typically dependent on the manufacturing process itself. Biotherapeutic medicines are an integral and valuable part of modern medicine for the treatment and prevention of serious illnesses and diseases.

Body:**Importance of Biotherapeutic medicines:**

- **Lives touched:**
 - Biotherapeutic medicines benefit more than 350 million patients worldwide, treating widespread diseases such as cancer and diabetes, as well as rare illnesses.
 - Being similar in structure to molecules naturally-produced in the human body, biotherapeutic medicines have great therapeutic impact in many disease areas and can additionally serve to diagnose other diseases
- **Tangible benefits:**
 - Many patients are leading healthier lives as a result of biotherapeutic medicines, often without realizing the source of these products.
- **Biotherapeutic medicines & cancer:**
 - Major strides in fighting cancer successfully go hand in hand with improved diagnostics, treatments and prevention methods. Biotherapeutic medicines play a role in the discovery and development of
 - Today, biomarkers help in predicting the risk of cancer, diagnosing it, and indicating a potential effective course of treatment.
- **Biotherapeutic medicines & autoimmune diseases:**
 - If left untreated autoimmune diseases such as Crohn's disease and rheumatoid arthritis can lead to early mortality.
 - Biotherapeutic medicines have proved successful and have had a highly positive impact in the treatment of these diseases.

The need for guidelines to regulate the accessibility and affordability of this new class of medicines:

- Both accessibility and affordability of this new class of medicines in developing countries is abysmally poor, owing largely to their high prices.
- Although a lot of research and development efforts are focused on innovative biotherapeutic products, the high cost and restricted market availability has limited their use.
- Similar biotherapeutic products (SBPs) are "similar" but not identical versions of their innovative biotherapeutic medicine of reference. SBPs are the analogous version of generic medicines in biotherapeutics.
- Whereas producing generic versions of off-patent chemically-synthesized medicines is relatively easy, producing an SBP is far more complicated due to the complex molecular structure and the unique manufacturing process required for biotherapeutic medicines.

- SBPs require distinct regulatory standards than those applied to generic medicines.
- SBP standards require thorough analytical characterization and quality studies as well as abbreviated pre-clinical and clinical development programs to show high similarity to the reference innovative biopharmaceutical medicine in terms of quality, safety and efficacy.
- Civil Society groups claim that even though a Resolution of the World Health Assembly in 2014 mandates the Director General to convene the WHO expert committee on biological standardization to update the 2009 guidelines, till date, the secretariat has neither updated the SBP guidelines nor has the WHO given any scientific reasons for the decision.
- The secrecy of the scientific reasons for insisting on comparative clinical trials for the approval of SBP.
- Lack of public consultations to review the scientific evidence with respect to the need for comparative clinical trials, among other things.

Conclusion:

- As the patents of some biopharmaceuticals have expired, more biosimilars or SBPs are being produced. Like generic medicines, biosimilars could help to increase access to treatment in lower-resourced countries and provide a solution to escalating health costs in high-income countries. Thus, there is a need to update the guidelines.

Q) What is gene editing, should it be allowed ? Give your opinion while you weigh the associated pros and cons. (250 words)

Why this question:

The question is to evaluate the pros and cons of the concept of gene editing.

Demand of the question:

The answer must explain the concept of gene editing and evaluate the ethical angle involved, one must assess the merits and demerits of the same.

Structure of the answer:

The answer to the question must have the following parts:

- Gene editing or genome editing, involves the insertion, deletion, or replacement of DNA (deoxyribonucleic acid) in a gene.
- Discuss the pros and cons; pros – use in cure of cancer, genetic diseases, drug research, Agriculture- pest resilient crops etc.
- What are the disadvantages associated? – ethical aspect, scope to be used in bio weapons, unknown diseases etc.
- Then move on to discuss whether it should be allowed? Opine that should be encouraged to enhance the advancements in field of science and improve the standard of living of people etc.

Conclusion:

Conclude with what should be the way ahead.

Introduction:

- Gene Editing is a type of genetic engineering in which DNA is inserted, deleted, modified or replaced in the genome of a living organism. Unlike early genetic engineering techniques that randomly insert genetic material into a host genome, genome editing targets the insertions to site specific locations.
- **CRISPRs** (clustered regularly interspaced short palindromic repeats) are sections of DNA, while **CAS-9** (CRISPR-associated protein 9) is an enzyme. Often described as “a pair of molecular scissors,” CRISPR is widely considered the most precise, most cost-effective and quickest way to edit genes.

Body:

Pros:

- Most uses of genome editing have been in scientific research –for example to investigate models of human disease.
- Genome editing has the potential to alter any DNA sequence, whether in a bacterium, plant, animal or human being.
- It is a powerful tool that can reshape the way society deals many issues of healthcare, food scarcity and the environment.
- Crops and livestock (e.g. increasing yield, introducing resistance to disease and pests, tolerance of different environmental conditions).
- Industrial biotechnology (e.g. developing ‘third generation’ biofuels and producing chemicals, materials and pharmaceuticals).

- Biomedicine (e.g. pharmaceutical development, xenotransplantation, gene and cell-based therapies, control of insect-borne diseases).
- Reproduction (e.g. preventing the inheritance of a disease trait).
- Engineering mosquitoes to control malaria and dengue.
- It can help fight against blood-related disorders such as haemophilia, sickle cell anaemia, and Beta-Thalassemia.
- All such applications together can drive India's economic growth over the next decade to new heights.

Cons:

- Study by Stanford University, U.S., found that the CRISPR-Cas9 system introduces unexpected off-target (outside of the intended editing sites) effects in mice. The fear that the CRISPR system is being prematurely rushed for clinical use lingers. Three recent reports have exacerbated this fear even further.
- Studies highlighted that CRISPR-Cas9-edited cells might trigger cancer.
- **P53 protein:**
 - CRISPR-Cas9 system induced activation of a protein called P53. This P53 protein acts like a gatekeeper or guardian in the cells to keep them healthy and prevents them (the cells) from turning cancerous. In many cancers, cells lose their ability to repair deleterious genetic changes due to an impaired P53 function.
 - In cells where editing is adequate, the cell's P53 protein may be dysfunctional. Therefore, a functional pP53 protein is good for the cells to be healthy but makes the Cas9-mediated editing process less effective.
- The impending danger of **mosaicism**, in which some cells inherit the target mutation, while others don't.
- Scientists are far from understanding **how exactly individual genes influence phenotypes**, or the visible traits of people.
- **Every gene likely influences multiple traits**, depending on the **environment it interacts**. This makes it hard to predict the ultimate outcome of an embryo-editing exercise without decades of follow-up.
- Every gene **influences trade-offs**, which scientists barely understand today. **Example:** while protecting against HIV, a deactivated CCR5 gene can also make people more susceptible to West-Nile Fever.
- Editing human embryos to repair disease-causing genes is **far more controversial**.
- **Issue of Designer babies:** The eyes of the mother, the hair of the father, the complexion from the maternal side and a cute little dimple from the paternal is what makes the kid loved by one and all. Designing the babies to look like celebrities might get the kids to thank you later in life but might **loosen the bond** that is supposed to be the significant part of the relationship.
- There are prospects of irreversible harms to the health of future children and generations, to concerns about opening the door to **new forms of social inequality, discrimination, and conflict**.
- Such living experiments are **done in secret**, outside of any formal institution, and apparently without any independent scrutiny or review by the scientific fraternity.
- Bioethicists fear abuse of gene editing, not just by misguided governments hoping to create a '**superior**' race.

The debate about gene editing has been going on for a long time now. Gene editing should be encouraged to enhance the advancements in field of science and improve the standard of living of people E.g.: CRISPR technology is targeting to treat the rare disease caused by mutation of one gene. At the same time a common guidelines need to be developed by international community's which set the guidelines of what risks are acceptable and what are not.

Way Forward:

- India's current regulatory architecture for approving novel treatments is ambiguous and assigns overlapping functions to different governmental bodies. This framework needs to be **restructured to optimize trial approval time while addressing safety requirements**.
- A **two-step model** wherein the **government works with industry and research groups to accelerate clinical research is recommended**. This model consists of a national apex committee working in collaboration with existing institutional ethics committees and independent accreditation agencies.
- It is envisaged that, India will emerge as a significant contributor to the world bioinformatics market and position itself as a global hub for bioinformatics.
- Indian bioinformatics sector has numerous strengths and competitive advantages to make bioinformatics sector a sunrise industry of India.

- With the improvements in the IPR regime, increasing support from the government and continuing efforts of the private sector companies, it is very much likely that India could repeat its IT success story in bioinformatics too.
- Much research on animal models and isolated human cells should be conducted before any full-scale routine application in humans.

Q) Evaluate the provisions of the Intellectual Property Rights (IPR) Policy in India. What are the challenges being faced by it? Suggest measures needed to ensure transparency and enhance protection of the same. (250 words)

[The hindubusinessline](https://www.insightsias.com/the-hindubusinessline)

Why this question:

The article highlights the urgent need to address Intellectual Property (IP) concerns. Over the past year, India took steps to address intellectual property challenges and promote IP protection and enforcement. However, many of the actions have not yet translated into concrete benefits for innovators and creators, and long-standing deficiencies persist. India remains one of the world's most challenging major economies with respect to protection and enforcement of IP.

Key demand of the question:

The answer must discuss in detail the salient features of the current IPR policy of India and what are the challenges it faces and what measures are required to take it further.

Directive word:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer

Introduction:

write a few introductory lines on the importance of a robust IPR policy.

Body:

- Answer should have the following dimensions covered:
- Discuss what is an IPR policy? What are the salient features of India's IPR regime?
- Explain the specific issues associated, Why India is lagging behind?
- What needs to be done?
- Way forward.

Conclusion –

Conclude with significance and what should be the way forward.

Introduction:

- Intellectual Property Rights (IPRs) are legal rights, which result from intellectual invention, innovation and discovery in the industrial, scientific, literary and artistic fields. These rights entitle an individual or group to the moral and economic rights of creators in their creation.
- The National IPR Policy (2016) is a vision document that aims to create and exploit synergies between all forms of intellectual property (IP), concerned statutes and agencies. It sets in place an institutional mechanism for implementation, monitoring and review. It aims to incorporate and adapt global best practices to the Indian scenario.

Body:

Seven objectives of IPR Policy:

- IPR Awareness: To create public awareness about the economic, social and cultural benefits of IPRs among all sections of society.
- Generation of IPRs: To stimulate the generation of IPRs.
- Legal and Legislative Framework: To have strong and effective IPR laws, which balance the interests of rights owners with larger public interest.
- Administration and Management: To modernize and strengthen service-oriented IPR administration.
- Commercialization of IPRs: Get value for IPRs through commercialization.
- Enforcement and Adjudication: To strengthen the enforcement and adjudicatory mechanisms for combating IPR infringements.
- Human Capital Development: To strengthen and expand human resources, institutions and capacities for teaching, training, research and skill building in IPRs.

Important highlights of National Intellectual Property Rights (IPR) Policy

- The Policy aims to push IPRs as a **marketable financial asset**, promote innovation and entrepreneurship, while protecting public interest.
- In order to have strong and effective IPR laws, steps would be taken — including review of existing IP laws — to update and improve them or to remove anomalies and inconsistencies.
- The policy is **entirely compliant with the WTO's agreement on TRIPS**.
- **Special thrust on awareness generation and effective enforcement of IPRs**, besides encouragement of IP commercialisation through various incentives.
- India will engage constructively in the negotiation of international treaties and agreements in consultation with stakeholders.
- The government will examine accession to some multilateral treaties which are in India's interest, and become a signatory to those treaties which India has de facto implemented to enable it to participate in their decision making process, the policy said.
- It suggests making the department of industrial policy and promotion (DIPP) the nodal agency for all IPR issues. Copyrights related issues will also come under DIPP's ambit from that of the Human Resource Development (HRD) Ministry.
- Films, music, industrial drawings will be all covered by copyright.
- The Policy also seeks to **facilitate domestic IPR filings**, for the entire value chain from IPR generation to commercialization. It aims to promote research and development through tax benefits.

Issues with the current policy:

- Policy is aimed at a **gold rush towards IPR**. A blind rush towards IP could be a **deterrent to innovation itself by restricting knowledge flow**.
- Policy recommends scientist and professors to convert all their discoveries into IP which in turn has the potential to curb the free flow of knowledge.
- IPR policy is driven by the **agenda of IP maximalism**, where IP owners' rights will be maximised at the cost of public interest. This (policy) will influence courts and judges who might consider rights of patentees above that on common man in certain cases.
- Connection between patenting and application of patented knowledge is yet to be established. Hence, patenting and not applying the new invention could deter progress.
- Policy recommends **criminalization of unauthorised copying of movies** — which is just a civil wrong.
- Not understanding the modes of creativity and sharing in "**shadow economy**", the policy leans towards **superimposition of formal IP framework**.
- While IP could accelerate innovation in certain technologies it in turn impedes in others. Policy recommends scientist and professors to convert all their discoveries.
- According to USTR, Patent applicants face costly and time-consuming patent opposition hurdles, long timelines for receiving patents, and excessive reporting requirements.

Measures needed:

- Fostering an environment where innovation flourishes and a knowledge economy is built, is the key idea. Hence, the policy should have a balance.
- It should encourage patenting and at the same time ensure that patentability of a product/process does not deter further innovation and progress.
- Intellectual Property must not be about patents on paper but dearth of application in reality.
- The organisations such as CSIR and others must be encouraged to work upon socially useful applications of their patents.
- Support for innovation has to be accompanied with instruments that guard local companies against the misuse of market power, coercive bargaining and aggressive acquisition strategies.
- India needs to spread awareness on IPR in public and for its traditional industries to enable fair monetisation of IP Rights.
- It needs to safeguard its patents, copyrights and traditional knowledge by ensuring easy IPR rules.

Q) Explain the role played by robotics and its application to the agriculture sector of the country. What are its future prospects ? How far can Indian agriculture foresee mechanization of agriculture for its growth ? (250 words)

[Reference](#)

**Why this question:**

The article discusses in detail the application and role played by the robotics in the upbringing of Agri sector in India. The paper discusses in detail scope of robotics and mechanization it brings to Agriculture in India.

Key demand of the question:

Answer must discuss the role of robotics and prospect of it in Indian agriculture and mechanization and automation of the same.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

In a few introductory lines highlight the context of the question.

Body:

In brief discuss the following aspects:

- Current scenario of agriculture in India in comparison with other countries that have developed agriculture systems like US, Iran etc.
- Discuss how robotics can be applied to agrarian systems? What benefits it has and can bring?
- Explain the specific case of India.
- Discuss the scope and benefits in detail.
- Explain the challenges involved.

Conclusion:

Conclude with way forward.

Introduction:

- Robotics is the branch of technology that deals with the design, construction, operation, structural depositions, manufacture and application of robots.
- Today Robotics is the rapidly growing field and it is continue in research, design, and build new robots that serve various practical purposes. As it has taken drive in various fields is there any possibility that robot can be introduced in the farming.

Body:

The most popular applications of Robots in agriculture appear to fall into four major categories:

- **Crop and Soil Monitoring:** Companies are leveraging sensors and various IoT-based technologies to monitor crop and soil health.
- **Predictive Agricultural Analytics:** Various AI and machine learning tools are being used to predict the optimal time to sow seeds, get alerts on risks from pest attacks, and more.
- **Supply Chain Efficiencies:** Companies are using real-time data analytics on data-streams coming from multiple sources to build an efficient and smart supply chain.
- **Agricultural Robots:** Companies are developing and programming autonomous robots to handle essential agricultural tasks such as harvesting crops at a higher volume and faster pace than human labourers.

Some examples of Agricultural Robots:

- **Green seeker sensor:** This smart machine reads a plant's needs and then applies precisely the amount of fertilizer of herbicides needed. Green Seeker is a machine which uses the sensors to let the plant tell us that what it needs.
- **Robot drone tractors:** A new generation of robot drones is revolutionizing the way we farm, with manufacturing of different robots, e. announcing the first ever robot drone tractor becomes part of the agricultural mainstream. Robot will decide where to plant, when to harvest and how to choose the best route for crisscrossing the farmland.
- **Flying Robots To Spread Fertilizer:** A flying robot monitors the growing condition of the crops over farmlands in Ili, a Kazak autonomous prefecture in Northwest China's Xinjiang Uygur autonomous With camera equipment and an automatic fertilizing system in the front, the robot can fly autonomously and apply fertilizer independently.

- **Fruit Picking Robots:** The research is still in full progress, especially as the robots need to be carefully designed so that they do not bruise the fruit while picking. One solution is the use of suction grippers, used on automated fruit picking machines manufactured, for example, by
- **Robot Cattle Grazing and Automatic Milking:** Is the milking of dairy animals, especially of dairy cattle, without human labour. Automatic milking systems (AMS), also called voluntary milking systems (VMS), were developed in the late 20th century. They are commercially available since the early 1990s.

Scope of farm robots in India:

- Our farm equipment companies and researchers have developed a lot of small and heavy farm equipment for traditional farming needs but some kind of robotic and pneumatic mechanism are required in precision
- If the robots are being used for weed control, that will help to reduce the herbicides usage and the produces will turn into an organic, the same way robots can be used for transplanting the seedlings to avoid intensive
- A few impressive innovative technologies by rural inventors e. electric motors can be operated remotely by cell phones, it's very helpful to farmers in summer time since the power supply is irregular.
- Advanced intelligent machines in farming, Sensors or readers and hand held PDAs are going to be great helpful in computation and accuracy in
- There are lot of hurdles taken in the agriculture sector in all countries but specially in
- Farmers are decreasing in India. Many are leaving the farming profession by telling some repeated common sentences that it is no longer profitable and none want to get losses and it is becoming risky day by day.
- The disadvantages make the youngsters also disinterested in that.

Conclusion:

- Robotics will definitely bring the agriculture revolution. Although the road ahead is not very smooth. We have to calculate the feasibility, sustainability and efficiency meeting the world's food needs.
- However, it would be interesting to see how the farmers, agri-businessmen and the consumers will utilize the power of Robotics and digital-mechanization to shape the future of this industry.

Q) What do you understand by blockchain technology? Evaluate its prospects and challenges. (250 words)

[The hindubusinessline](https://www.insightsias.com/the-hindubusinessline)

Why this question:

Blockchain technology has been in news for quite a time now. The technology is not only revolutionary but also foundational in the sense other systems/ applications can be built on it.

Key demand of the question:

The answer must discuss

Directive word:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer

Introduction:

write a few introductory lines on the importance of a such remarkable technologies.

Body:

- Answer should have the following dimensions covered:
- Discuss the concept of blockchain Technology -The blockchain is an incorruptible digital ledger of economic transactions that can be programmed to record not just financial transactions but virtually everything of value.
- Enlist the possible applications of blockchain Technology in economic, societal and political spheres.
- Discuss the associated challenges, and how one can overcome it and bring its prospects to use.

Conclusion –

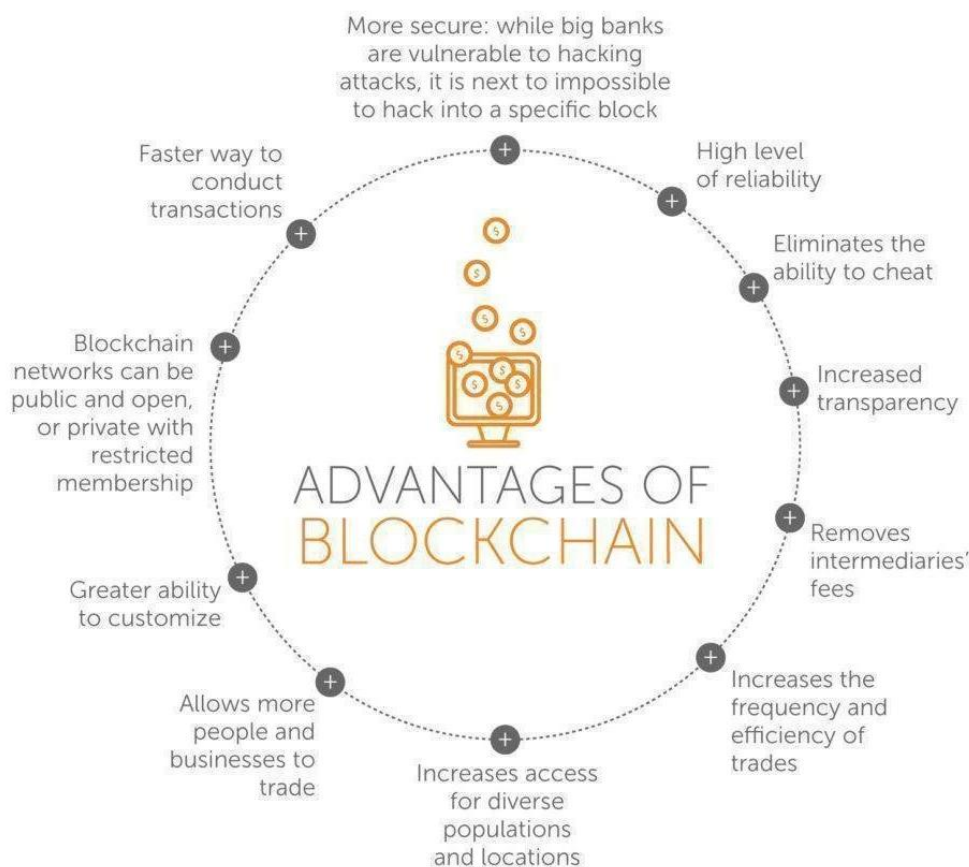

Conclude with significance and what should be the way forward.

Introduction:

- Blockchains are a new data structure that is secure, cryptography-based, and distributed across a network. The technology supports cryptocurrencies such as Bitcoin, and the transfer of any data or digital asset. Anything recorded on them cannot be deleted, and is instantly uploaded to all users on that blockchain. Blockchain is being researched across the banking and financial services industries.

Body:

Prospects:

- Bitcoin is just one of the applications for the technology, whose use is being tested across industries.
- Healthcare, banking, education, agriculture, electricity distribution and land records are sectors that could benefit.
- Blockchain-powered smart contracts, where every piece of information is recorded can enhance ease of doing business.
- It will augment the credibility, accuracy and efficiency of a contract while reducing the risk of frauds, substantially.
- Blockchain could play a crucial part in health insurance claims management by reducing the risk of insurance claim frauds.
- The technology can also be used to prevent the sale of spurious drugs in the country by tracking every step of the supply chain network.
- Artificial Intelligence and Internet of Things (IoT) can gain immensely from blockchain applications.
- In an IoT world, thousands of devices would need to rapidly and seamlessly transact with each other in real time.
- The adoption of blockchain by India's banks could help avert frauds such as the one at Punjab National Bank as the technology updates information across all users simultaneously.
- It could be used to further strengthen our national institutions, including the judiciary and the Election Commission.
- Critical citizen information like land records, census data, birth and death records, business licenses, criminal records, intellectual property registry, electoral rolls could all be maintained as blockchain-powered, tamper-proof public ledgers.

**Challenges:**

- Blockchain technology is expensive to initially put it in place.
- The massive usage of energy for the functioning of blockchain.
- Safeguarding the privacy of individuals and companies as blockchains are usually open ledgers for everyone to see.
- Knowledge of the benefits of distributed ledger technology is still limited.
- If automated risk management, smart contracts, and similar tools are deployed across a network, cascades of rapid and hard-to-control obligations and liquidity flows could propagate across a network.
- This interdependence will likely call for creative organizational thinking to address the need for governance and strong risk management

Way Forward:

- Blockchain, with all its possibilities, needs a serious look at its vulnerabilities and commerciality.
- Before introducing blockchain into the public sector data-handling system, we need a robust and informative data repository.
- Linking **IndiaChain** with Aadhar, thus creating a secure personal identity for all Indians.
- Proper regulations for the use of blockchain technology in the country.
- Identifying and resolving key issues and challenges in implementing this technology, the prime amongst those being data privacy.
- India should effectively channel its technical human capital surplus to position itself as one of the pioneers during this upcoming wave of innovation.

Topic: Conservation, environmental pollution and degradation, environmental impact assessment.

Q) Climate change is not anymore only an environmental problem, but a unique one with multi-scalar characteristic, from the global to the local. Comment, also discuss challenges in tackling the problem of climate change across the world. (250 words)

The hindu

Why this question:

The article explains in detail the issue of climate change facing the world and how it is not anymore just about being an environmental problem but much more than that, it highlights the multi-dimensional aspects of climate change and critically analyses the associate problems in tackling it.

Key demand of the question:

The answer must discuss the alarming need to address the climate change differently from the usual methods of commitments as they are not doing there bit anymore to address the impact of climate change effectively.

Directive word:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:**Introduction:**

In a few introductory lines explain how climate change is a multi-faceted problem today.

Body:

- Explain – why climate change is an immediate issue that needs address and action today?
- Explain the issue with facts and figures – Global warming above pre-industrial levels has touched about 1 degree Celsius etc.
- What are the challenges in addressing climate change ?
- complex linkages among emissions, concentrations, climate changes, and impacts.
- Lack of certainty about the details of future climate change.
- significant time lags in human response systems.
- Risks, judgments about risk, and adaptation needs are highly variable across different contexts.
- Suggest what needs to be done?
- Discuss Indian context and what should India's move be to tackle climate change at individual level as well as in collaboration with world countries.

Conclusion:

Conclude with urgency of the need to tackle climate change.

Introduction:

- Climate change is a complex problem. It is inextricably linked with society, economics, politics, and people's way of life. More than 190 countries signed the Paris Agreement in 2016, committing to change how they create and use energy in order to lower impacts of carbon and other greenhouse gases on the planet.
- All over the world, people and organizations are taking action to both lower carbon footprints and find innovative ways to adapt to the effects of climate change.

Body:

Climate change is an immediate issue to be tackled:

- Global warming above pre-industrial levels has touched about 1 degree Celsius.
- The IPCC 1.5 report basically says, at the current rates at which we are producing greenhouse gases, we are looking at a couple of decades really before what we have available is exhausted.
- At one level, for many people climate change has become an existential problem, a problem that risks undermining the conditions for productive life and therefore a problem that does not override but certainly permeates all kinds of other issues.
- For many others, climate change is a distant problem that is overwhelmed by more immediate issues.
- The rapid change of climate change is likely to exceed the ability of many species to migrate or adjust. Experts predict that one-fourth of Earth's species will be headed for extinction by 2050 if the warming trend continues at its current rate.
- Sea levels have risen between four and eight inches in the past 100 years. Current projections suggest that sea levels could continue to rise between 4 inches and 36 inches over the next 100 years.
- As temperatures rise globally, droughts will become more frequent and more severe, with potentially devastating consequences for agriculture, water supply and human health. This phenomenon has already been observed in some parts of Asia and Africa, where droughts have become longer and more intense.
- Hot temperatures and dry conditions also increase the likelihood of forest fires.

Challenges in addressing climate change:

- **Regional Inequality:**
 - The principle of Common but differentiated responsibilities was proposed to tackle climate change by addressing the regional inequality.
 - However, the indifferent behaviour by the developed countries has led to partial success of many global initiatives. Eg. Kyoto Protocol.
- **Developed Countries not taking responsibility:**
 - Historical emissions and pollution caused due to industrial revolution is not accepted by the industrialized nations.
 - Developed nations are unwilling to accept the responsibility and are moving away from global agreements. Eg. USA rejecting the Paris deal.
- **Finance:**
 - Huge amount of funds are required for adaptation and mitigation measures to be adopted.
 - For eg: electric mobility, certainly is a green measure, but is actually expensive, in immediate terms, in terms of cost per vehicle kilometre.
 - The cost of shifting into renewable energy is also a fiscal challenge to most countries.
- **Technology:**
 - Many adaptation and mitigation measures need sophisticated technologies and Research and Development which is an impediment to many developing and small island nations.
 - Commercialization of technology in form of Patents, evergreening has made it unaffordable.
- **Increasing use of fossil fuels.**
- **Complex linkages among emissions, concentrations, climate changes, and impacts.**
- **Lack of certainty about the details of future climate change.**
- **Significant time lags in human response systems.**
- **Risks, judgments about risk, and adaptation needs are highly variable across different contexts.**

Way Forward

- Wealthy nations like the U.S., and those of the EU argued that emissions from developing countries are consistently rising and they need to commit to more serious emission cuts. A consensus needs to be developed at the earliest.
- The immediate up scaling of ambition in the second Commitment period of Kyoto Protocol and its early ratification by all Kyoto Protocol parties would be a step in the right direction.

- Concerning mitigation, distinction enshrined in the Convention between Annex I (Developed) and non-Annex I (developing) Parties must be maintained in accordance with the principles of Equity, CBDR and other provisions of the UN Conventions.
- The 'developing versus developed country' schism needs to be diluted at the earliest and Developed Countries should avoid watering down the CBDR principle envisaged in earlier agreements.
- Investment in R&D is needed to spur innovations in sustainable climate-friendly and climate-proof productivity, and the private sector can help on this.

Q) "India's conservation policies and legislation in environmental domain over the years reveal a dichotomy of intent and action". Critically analyse. (250 words)

The hindu

Why this question:

The article provides for a detailed analysis India's conservation policies and legislation in environmental domain. It highlights that India is stridently moving away from community-involved conservation models.

Key demand of the question:

One needs to analyse India's conservation policies and legislation in environmental domain with major focus on the recent shift in its approach that has moved away from community-involved conservation models.

Directive word:

Critically analyse – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In a few introductory lines explain the background of the question.

Body:

In brief discuss –

Discuss the recent legislations that highlights the alarming issue concerning India's environmental policy like the eviction of more than a million forest-dwelling people from their homes.

- Discuss the policies and initiatives of the government in this direction.
- Discuss why there is Expropriation in the name of conservation?
- Explain the Indian Forest Act, Forest Rights Act; lacunae with the proposed amendments etc.
- Take cues from the article and suggest your opinion and provide for a balanced judgement.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- The Supreme Court has asked the governments of 17 states to evict an estimated one million tribal and other households living in forests after their claims of the right to live in forests were rejected under the **Forest Rights Act**. As a consequence, more than one million tribals could be displaced, mainly in central India.
- Although this order was subsequently stayed, though temporarily, it provides valuable insights into India's conservation objectives and approaches. Given the country's size and biodiversity-richness, a decision of this nature has consequences for global natural heritage.

Body:

India's conservation laws and policies:

- From the 1980s, there were a number of policies that mirrored the global shift towards inclusive conservation, such as the **1988 National Forest Policy, the 1992 National Conservation Strategy, the National Environment Policy of 2006 and the 2007 Biosphere Reserves Guidelines**.
- India's conservation legislation is separated into those that protect forests and its produce, and those that target wildlife conservation.
- Both the **Indian Forest Act, 1927** and the Wildlife Protection Act, 1972 create different types and grades of protected areas, and contain provisions to restrict or outlaw local use of natural resources and landscapes.
- India has been a vocal member of above conventions. But at home, things operate rather differently, despite there were a number of policies that mirrored the global shift towards inclusive conservation.

- The **Forest Rights Act, 2006** went beyond sanctioning local usage, to conferring rights to local communities over forest land and produce.
- The Ministry of Tribal Affairs was mandated with operationalising the Act, while conservation remained under the domain of the Ministry of Environment, Forest and Climate Change.
- However, given a hostile bureaucratic environment, the legislation faltered, except in certain pockets.
- The **Third National Wildlife Action Plan**, introduced in 2017, is categorically of the view that locals hinder conservation.
- Where communities are to be involved, it distinctly avoids the attribution of rights and instead frames usage within a bureaucracy-controlled format.

Dichotomy of intent and action:

- In the year 1990, Joint Forest Management Guidelines (JFM) created community institutions for co-management, in collaboration with the forest bureaucracy.
- Although it initially registered some success stories in certain parts of the country, JFM committees are widely critiqued as being bureaucracy-heavy, with little real devolution of powers to local communities.
- In March 2019, a comprehensive overhaul of the Indian Forest Act was proposed.
- This amendment introduces provisions for extinguishing rights granted under the Forest Rights Act.
- Further, it grants the forest bureaucracy unprecedented powers to enter and search the premises of forest-dwellers on suspicion, arrest without warrant and use firearms to meet conservation goals.
- State authority that is usually reserved to tackle terrorism, insurgency and organised crime is now to be deployed to safeguard biodiversity.
- An amendment to the Wildlife Protection Act is reportedly in the offing. India's conservation policies in recent years leave no doubt as to the model of conservation the country is intent on pursuing.

Way forward:

- Most community-based natural resource management programmes may have only limited success at achieving both conservation and human development goals.
- But the concept appears to be the best opportunity for countries like India to achieve these two outcomes of conservation and human development goals.
- The most important part of the approach is that user rights are transferred from central government to local communities.
- The model is being increasingly promoted as a conservation tool and has become the dominant approach in natural resource conservation worldwide.
- It can help the country retain its place as one of the most famous and profitable wildlife tourism destinations in the world. And it can also contribute to other economic sectors and alleviate rural poverty.

Conclusion:

- **Involving communities living in and around natural resource-rich areas in the management and use of these resources** is an effective tool of conservation that has been recognised across the world.
- This was affirmed by the **1980 World Conservation Strategy of the International Union for Conservation of Nature (IUCN)**, and the **Earth Summit's 1992 Statement of Forest Principles** and the **Convention on Biological Diversity**. India needs to **value the community-involved conservation models** like other successful countries.

Q) Do you agree that the benefits of biodiversity far exceed the costs of current levels of biodiversity protection ? Explain the impacts of biodiversity on economic activities of a country. (250 words)

The hindu

Why this question:

The article discusses in detail the economic costs associated with the biodiversity. It highlights the findings of the global assessment report of the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) which states that human beings have so rapaciously exploited nature, and that species belonging to a quarter of all studied animal and plant groups on earth are gravely threatened.

Key demand of the question:

The question expects one to analyse the need for Biodiversity assessments that must be factored into all economic activity.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with significance of conservation of biodiversity for sustenance of economy.

Body:

Discussion should include the following aspects –

- Highlight the nature and scale of benefits that we, as a society, derive from biodiversity.
- Discuss that it is important that public goods, including those supplied by nature, are reflected in decision making. It is also important to ensure that the benefits of policies which protect biodiversity are at least commensurate with the costs of such policies.
- Explain why benefits of biodiversity far exceed the costs of current levels of biodiversity protection.
- Elaborate how a high level of biodiversity also ensures that we are
- supplied with the 'ecosystem services' that are essential to the sustainability of our standard of living and to our survival.
- Re assert on significance of the biodiversity conservation to economic aspects.

Conclusion:

Conclude with a way ahead.

Introduction:

- The overwhelming message from **the global assessment report of the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)** is that human beings have so rapaciously exploited nature, and that species belonging to a quarter of all studied animal and plant groups on earth are gravely threatened.
- Biodiversity not only encompasses the ecological processes as we can see them, but also holds the key to the evolutionary processes that sustain life and the cultural relationships that nurture the spirit.

Body:

Benefits of Biodiversity conservation:

- Nature provides ecosystem services which are vital for food production, for clean air and water, provision of fuel for millions, absorption of carbon in the atmosphere, and climate moderation.
- Conservation of biological diversity leads to conservation of essential ecological diversity to preserve the continuity of food chains.
- The genetic diversity of plants and animals is preserved.
- It ensures the sustainable utilisation of life support systems on earth.
- It provides a vast knowledge of potential use to the scientific community.
- A reservoir of wild animals and plants is preserved, thus enabling them to be introduced, if need be, in the surrounding areas.
- Biological diversity provides immediate benefits to the society such as recreation and tourism.
- Biodiversity conservation serves as an insurance policy for the future.

However, the modern day economy does not often include the above benefits in productivity estimates. The result of such skewed policies, as the IPBES estimates, is that the global rate of species extinction is at least tens to hundreds of times higher today than the average rate over the past 10 million years, and it is accelerating alarmingly.

Threats to Biodiversity:

- Ecological economists have for years pointed to the extreme harm that humanity as a whole is courting by modifying terrestrial, marine and freshwater ecosystems to suit immediate needs, such as rising agricultural and food output and extracting materials that aid ever-increasing consumption.
- Expanding agriculture by cutting down forests has raised food volumes, and mining feeds many industries, but these have severely affected other functions such as water availability, pollination, maintenance of wild variants of domesticated plants and climate regulation.

- Losses from pollution are usually not factored into claims of economic progress made by countries, but as the IPBES assessment points out, marine plastic pollution has increased tenfold since 1980, affecting at least 267 species, including 86% of marine turtles, 44% of seabirds and 43% of marine mammals.

Impacts of biodiversity on economic activities of a country:

- Agriculture, forestry and fisheries products, stable natural hydrological cycles, fertile soils, a balanced climate and numerous other vital ecosystem services depend upon the conservation of biological diversity.
- Food production relies on biodiversity for a variety of food plants, pollination, pest control, nutrient provision, genetic diversity, and disease prevention and control. Both medicinal plants and manufactured pharmaceuticals rely on biodiversity.
- Decreased biodiversity can lead to increased transmission of diseases to humans and increased healthcare costs.
- The outdoor tourism industry relies on biodiversity to create and maintain that which tourists come to see, as does the multi-billion dollar fishing and hunting industry.
- Amidst continuing loss of natural habitat and biodiversity, it is necessary to examine the benefit:cost ratio of investments in habitat conservation.
- Evidence has been accumulating that shows habitat conservation generates more economic benefits than does habitat conversion

Way forward:

- About 9% of 6,190 domesticated breeds of mammals used for food and agriculture had gone extinct by 2016, and another 1,000 may disappear permanently.
- Viewed against a shrinking base of wild varieties of farmed plants and animals, all countries have cause for alarm.
- They are rapidly emptying their genetic resource kit.
- Reversing course is a dire necessity to stave off disaster.
- This can be done by incorporating biodiversity impacts into all economic activity, recognising that irreparably breaking the web of life will impoverish and endanger people everywhere.

Q) “To ensure that development does not degrade lives, it is imperative to mainstream biodiversity and ecosystem concerns in policy-making”. Critically analyse. (250 words)

Economictimes

Why this question:

A new report from UN’s Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services, the most comprehensive assessment of the global ecosystems to date, has provided as an indictment of how humans have treated the Earth. The report highlights the alarming situation of ecosystem degradation.

Key demand of the question:

The answer is straightforward, one must discuss in detail the significance of mainstreaming biodiversity and ecosystem concerns in policy-making.

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer

Introduction:

write a few introductory lines , highlight the findings of the report.

Body:

Answers must discuss the following aspects :

- Provide for a narration on the present conditions of ecosystem.
- Explain why the situation is grim?
- What are the Main causes of the deterioration of the natural ecosystem? – land-use change, overfishing, pollution, climate change and population growth etc.
- Explain the need for radical transformation of the systems of consumption and production to those that are resource efficient and generate less waste through the life cycle.

- Suggest upon recent steps taken by the government in this direction.
- Provide for way forward.

Conclusion –

Conclude by reasserting their significance of policy making that is centric to biodiversity and ecosystem conservation.

Introduction:

- The first-ever **Global Assessment Report on Biodiversity and Ecosystem Services** by **Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES)** has been released. The Report is termed as the first-ever such comprehensive report. It took three years for a group of 145 expert authors from 50 countries to prepare this report based on more than 15,000 scientific and government documents. It primarily looked or analysed the impact of economic development on nature and ecosystems.

Body:

Findings of the report:

- The report identified a range of risks, from the disappearance of insects vital for pollinating food crops, to the destruction of coral reefs that support fish populations that sustain coastal communities, or the loss of medicinal plants.
- It found that the average abundance of native species in most major land-based habitats has fallen by at least 20%, mostly since 1900.
- The threatened list includes more than 40% of amphibian species, almost 33% of reef-forming corals, and more than a third of all marine mammals.
- The picture was less clear for insect species, but a tentative estimate suggests 10% are at risk of extinction.
- Productivity in 23 per cent of global land has reduced due to land degradation.
- Up to \$577 billion in annual global crops are at risk from pollinator loss and 100-300 million people are at increased risk of floods and hurricanes because of loss of coastal habitats and protection.

Causes:

- This loss is a direct result of human activity and constitutes a direct threat to human well-being in all regions of the world.
- Human-induced loss in ecosystems: Three-quarters of the land-based environment and about two-thirds of the marine environment have been significantly altered by human actions, says the assessment.
- Nearly 75 per cent of all freshwater resources are now used for crop and livestock rearing activities.
- Changes in land and sea use
- direct exploitation of organisms
- pollution
- invasive alien species
- Climate change caused by burning the coal, oil and gas produced by the fossil fuel industry is exacerbating the losses, the report found.

Way forward:

- The report says there is still an opportunity for human beings to live in harmony with nature.
- But there has to be a change in the way how natural resources are governed, and things are produced and consumed.
- This is inevitable in terms of economies, livelihoods, food security, health and quality of life worldwide.
- By transformative change, that is a fundamental, system-wide reorganization across technological, economic and social factors, including paradigms, goals and values.
- The findings will also add to pressure for countries to agree bold action to protect wildlife at a major conference on biodiversity due to take place in China towards the end of next year.
- Compartmentalisation must give way to an integrated and synchronised approach. India and the world have the knowledge and regulatory framework required for the transformation.

Q) Plastic pollution is a pressing environmental concern that requires our collective action. Discuss this statement in the background of Basel Convention on the control of hazardous wastes which recently was amended to include plastic waste. (250 words)

[The hindu](#)

**Why this question:**

Recently Around 180 governments agreed on a new UN accord to regulate the export of plastic waste. Thus, it is important for us to evaluate the pressing concern that plastic pollution poses on the environment today.

Key demand of the question:

Analyse in detail how Plastic pollution is a pressing environmental concern that requires our collective action. The growing levels of plastic waste are becoming unmanageable, every year, more than eight million tons end up in the oceans. Thus, we have to analyse the causes and consequences of the same.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines highlight some facts to justify the current menace of plastic pollution.

Body:

In brief discuss –

- Start by stating some facts /reports to justify the current conditions of plastic pollution.
- Highlight the agreement that was reached recently that took the form of an amendment to the Basel Convention on the Control of Transboundary Movements of Hazardous Waste and their Disposal, to include plastic waste and improve the regulation of its trade.
- Identify the Dangers of the Plastic Era – discuss the causes and consequences.
- Highlight the need for collective action.

Conclusion:

Conclude by reasserting the need to curb and control the menace of plastic pollution and the threat it poses on the environment.

Introduction:

- The **Basel Convention on the Control of Transboundary Movements of Hazardous Wastes** and their Disposal was created to protect people and the environment from the negative effects of the inappropriate management of hazardous wastes worldwide. Around 180 governments recently agreed on a **new UN accord to regulate the export of plastic waste**, some eight million tonnes of which ends up in the oceans each year.

Body:Key highlights of the accord:

- The accord members agreed to make global trade in plastic waste more transparent and better regulated and to ensure that its management is safer for human health and the environment.
- The **legally binding framework** which amends the Basel Convention.
- The accord affects products used in a broad array of industries, such as healthcare, technology, aerospace, fashion and food, and beverages.
- The accord is a crucial first step towards stopping the use of developing countries as a dumping ground for the world's plastic waste, especially those coming from rich nations.
- Accordingly, countries will have to figure out their own ways of adhering to the accord.
- Countries that did not sign the deal like the United States could be affected by the accord when they ship plastic waste to countries that are on board with the deal.
- The agreement is likely to lead to customs agents being on the lookout for electronic waste or other types of potentially hazardous waste more than before.

Dangers posed by Plastic pollution:

- The recycling efforts are failing to keep pace with production.
- Current standard water treatment systems do not filter out all of the microplastics.
- It is creating an environmental crisis comparable to climate change.
- Cattle and other animals unknowingly consume some of this plastic material which is not digested, end up with painful death. This will have an impact for the farmers and on the Indian economy.
- Pollutants also upset primary food production in waterbodies by preventing the entry of sunlight into water.
- Plastic pollution in beaches also impact tourism.
- The ban on plastic carry bags below 40 microns in many states has not yielded the desired results

**Way forward:**

- ULBs could take cue from cities like Bangalore where dry waste collection centres have not only been established but also have a self-sustainable business model.
- Municipalities must develop waste collection plans, coupled with outreach activities, to sensitise citizens on waste segregation.
- It is imperative to develop a phase-wise implementation of the EPR programme with yearly targets and a system of nationwide offsets and credit to ensure effective implementation of the rules.
- International examples:
 - The success of imposing a plastic bag fee has also been established in cities like Chicago and Washington, showing that such interventions could be effective in shaping behaviour change.
 - The European Union is mulling new laws to ban some everyday single-use plastic products including straws, cutlery and plates citing plastic litter in oceans as the concern prompting the action.
- Encouraging plogging:
 - Picking up litter while jogging or strolling was kick-started on a small scale in a small part of Stockholm about an year ago, it has spread across the globe and India can adopt this as well.
- Countries such as the U.S., Canada and the Netherlands have already put in place regulations to stop the use of microbeads in personal-care products. The sooner India adopts such regulations, the better
- Recycling has to ensure that wastes are converted into products of the same quality, if not better, compared to the original product.
- Stop using single use plastic:
 - The Government of the state of Maharashtra has announced an ambitious ban of plastic bags, water bottles and other disposable plastic items in the state after the state civic bodies started facing serious problems on garbage disposing and its management.
 - Fine for violating the ban will be Rs 5,000 for the first offence, Rs 10,000 for the second and Rs 25,000 for the third offence or a three-month jail term or both.
- With a worldwide crisis due to plastic waste, India has to involve all the stakeholders take the responsibility of ensuring minimisation, reuse and recycling of plastic to the maximum.
- Sensitise people to stop littering and segregate their waste. Nowadays the most popular eco-conscious effort is participating in beach cleanups.
- Sanitary napkins made from biodegradable material, menstrual cups should be promoted.

Q) CSIR-Centre for Cellular and Molecular Biology recently sequenced Asiatic lion genome. Discuss in what way such projects can be significant turning points in the conservation efforts of such endangered animals ? (250 words)

The hindu

Why this question:

For the first time, the entire genome of Asiatic lion has been sequenced by scientists from CSIR-Centre for Cellular and Molecular Biology, Hyderabad.

The objective was to understand the species at DNA level and study if there were any specific problems with regard to adaptability to environment or behaviour vis-à-vis other big cats.

Key demand of the question:

Analyse in detail the project and Significance of the project and how it can prove to be a significant turning points in the conservation efforts of such endangered animals.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines highlight some facts depicting the status of Asiatic Lion in India.

Body:

In brief discuss –

- Start by discussing the details of the project – What is genome sequencing? About Asiatic lion and CCMB.

- Highlight the significance of such a project – How it would help researchers to better understand the evolution of Asiatic lions and also make possible comparative analysis with other big cats.
- It would enable scientists to develop specific markers to study population genetics (the differences at the gene level within a population) and get newer insights into its population status and subsequent management.
- It will enable better disease and population management of the endangered big cat by identifying characteristics which are specific to Asiatic lions etc.

Conclusion:

Conclude by reasserting the significance of such projects in the conservation efforts.

Introduction:

- A genome is an organism's complete set of DNA, including all of its genes. Genomics is an interdisciplinary field of science focusing on the structure, function, evolution, mapping, and editing of genomes.
- Genomics also involves the sequencing and analysis of genomes through uses of high throughput DNA sequencing. For the first time, the entire genome of Asiatic lion has been sequenced by scientists from **CSIR-Centre for Cellular and Molecular Biology, Hyderabad**.

Body:

- The objective is to **understand the species at DNA level and study if there are any specific problems with regard to adaptability to environment or behaviour vis-à-vis other big cats.**

Importance of Genome Sequencing:

- Sequencing the genome is an important step towards understanding it.
- The genome sequence will represent a valuable shortcut, helping scientists find genes much more easily and quickly. A genome sequence does contain some clues about where genes are, even though scientists are just learning to interpret these clues.
- Scientists also hope that being able to study the entire genome sequence will help them understand how the genome as a whole works—how genes work together to direct the growth, development and maintenance of an entire organism.
- Finally, genes account for less than 25 percent of the DNA in the genome, and so knowing the entire genome sequence will help scientists study the parts of the genome outside the genes.
- This includes the regulatory regions that control how genes are turned on and off, as well as long stretches of “nonsense” or “junk” DNA—so called because significance of it hasn't been established.

Need and significance:

- This firsthand information would help researchers to better understand the evolution of Asiatic lions and also make possible comparative analysis with other big cats.
- The population of the endangered Asiatic lion is very low — only 523 animals are present in the Gir forests.
- The genome sequencing would enable scientists to develop specific markers to study population genetics (the differences at the gene level within a population) and get newer insights into its population status and subsequent management.
- The study will enable better disease and population management of the endangered big cat by identifying characteristics which are specific to Asiatic lions. E.g.: 21 lions reportedly died between September and October in Gir forest of Gujarat due to Canine distemper virus, Such incidents can be avoided.
- Comparative genomics between African and Asiatic lions could be undertaken once the complete genome of the African lion is sequenced.
- Comparative analysis with other felids and mammalian genomes unravelled the evolutionary history of the Asiatic lion and its position among other felids.
- The study noted that the evaluation of genetic diversity placed the Asiatic lion in the lowest bracket of genomic diversity index highlighting the gravity of its conservation status.

Conclusion:

- With the complete genome of royal Bengal tiger, African Cheetah and Jaguar available, comparative studies of all these big cats would be possible. Such researches will help in adopting a multi-pronged approach towards conservation efforts.

Q) List down the objectives of India Cooling Action Plan. Explain how it is a bold response to addressing India's future cooling needs while neutralizing its impacts. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The author in the article discusses in detail how new plan for cooling technologies is in sync with environmental challenges in India. India is one of the first countries in the world to develop a comprehensive Cooling Action plan which has a long-term vision to address the cooling requirement across sectors and lists out actions which can help reduce the cooling demand. Thus, it is important for us to evaluate its significance.

Key demand of the question:

Analyse in detail the objectives of India Cooling Action Plan and explain how it is a bold step taken by India in this direction.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines highlight the significance of the ICAP.

Body:

- In brief discuss that – India is the first country in world to develop such a document (ICAP), which addresses cooling requirement across sectors and lists out actions which can help reduce the cooling demand. The overarching goal is to provide sustainable cooling and thermal comfort for all while securing environmental and socio-economic benefits for the society.
- Broad objectives of the India Cooling Action Plan include:
- Assessment of cooling requirements across sectors in next 20 years and the associated refrigerant demand and energy use.
- Map the technologies available to cater the cooling requirement including passive interventions, refrigerant-based technologies and alternative technologies such as not-in-kind technologies.
- Suggest interventions in each sector to provide for sustainable cooling and thermal comfort for all.
- Focus on skilling of RAC service technicians.
- Develop an R&D innovation ecosystem for indigenous development of alternative technologies.
- Explain the benefits India can reap from it

Conclusion:

Conclude with way forward.

Introduction:

- India is the first country in world to develop India Cooling Action Plan which addresses cooling requirement across sectors and lists out actions which can help reduce the cooling demand.
- The overarching goal is to provide sustainable cooling and thermal comfort for all while securing environmental and socio-economic benefits for the society.

Body:

The India Cooling Action seeks to

- reduce cooling demand across sectors by 20% to 25% by 2037-38,
- reduce refrigerant demand by 25% to 30% by 2037-38,
- Reduce cooling energy requirements by 25% to 40% by 2037-38,
- recognize “cooling and related areas” as a thrust area of research under national S&T Programme,
- Training and certification of 100,000 servicing sector technicians by 2022-23, synergizing with Skill India Mission. These actions will have significant climate benefits.

The broad objectives of the India Cooling Action Plan include:

- Assessment of cooling requirements across sectors in next 20 years and the associated refrigerant demand and energy use.
- Map the technologies available to cater the cooling requirement including passive interventions, refrigerant-based technologies and alternative technologies such as not-in-kind technologies.

- Suggest interventions in each sector to provide for sustainable cooling and thermal comfort for all.
- Focus on skilling of RAC service technicians.
- Develop an R&D innovation ecosystem for indigenous development of alternative technologies.

Environmental and Socio-Economic benefits:

- Thermal comfort for all – provision for cooling for Economically Weaker Section (EWS) and Low Income Group (LIG) housing
- Sustainable cooling – low GHG emissions related to cooling
- Doubling Farmers Income – better cold chain infrastructure – better value of produce to farmers, less wastage of produce
- Skilled workforce for better livelihoods and environmental protection
- Make in India – domestic manufacturing of air-conditioning and related cooling equipment.
- Robust R&D on alternative cooling technologies – to provide a push to innovation in the cooling sector.

Conclusion:

- ICAP addresses cooling requirement across sectors and lists out actions which can help reduce cooling demand. Its thrust is to look for synergies in actions for securing both environmental and socio-economic benefits.
- At its core, ICAP is about improving the quality of life and productivity of the people of India, and achieving many of the Sustainable Development Goals (SDGs) — thus accelerating the country's growth trajectory.

Q) Do you think growth of electric vehicles can be seen as an opportunity to create more livable cities ? Account for pros and cons of electric vehicles in justifying sustainable mobility the heartbeat of more livable cities in India. (250 words)

Hindustantimes

Why this question:

The article explains how Growth in EVs in India is not just a question of pushing one technology over another, it analyses in detail the relationship of mobility vehicles and sustainable and livable cities.

Key demand of the question:

The answer must discuss in detail the pros and cons associated with growth of electric vehicles in India and their contribution towards sustainable and livable cities.

Directive word:

Account for – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer

Introduction:

write a few introductory lines on electric mobility of vehicles.

Body:

Answers must discuss the following aspects :

- What do you understand by sustainable mobility? Role of electric vehicles in achieving the same.
- How can we achieve sustainable mobility to make India's cities more livable? – Explain how as India builds technology-filled "smart" cities, policymakers have an important opportunity to use sustainable mobility strategies to design cities around people, not cars.
- Comment on Urban mobility in India.
- Discuss in detail role played by electric vehicles, have a discussion on government's efforts in this direction like FAME II etc.

Conclusion –

Conclude that there is a need for models that marry efficiency and speed, cost, mobility and employment. At the core, initiatives must address the need to move people rather than traffic.

Introduction:

- Electric vehicles (EVs) are automobiles that run on electricity only. They are propelled by one or more electric motors powered by rechargeable battery packs.
- Electric vehicles are cleaner than petroleum-fuelled vehicles and are seen as a promising solution to global warming.

**Body:**

Electric vehicles and sustainable mobility:

- In India, the automobile industry is one of the key sectors driving economic growth.
- It is anticipated that the 2020s will be the decade of the electric car and a step forward towards a clean environment for the next generation.
- Electric vehicles are cleaner than petroleum-fuelled vehicles and are seen as a promising solution to global warming.
- Adoption of electric and shared vehicles could help country save \$60 billion in diesel and petrol along with cutting down as much as 1 gigatonne (GT) of carbon emissions by 2030. • It will help in achieving the target of "Paris climate agreement".
- Electric vehicles operating cost per kilometre driven is lower and it contributes to cutting city pollution.
- According to a research, 90 per cent of India's car owners would willingly switch to electric cars, with proper infrastructural support.
- The government aims for 30 per cent electric mobility by 2030

Pros of Electric Vehicles:

- **No Fuel Required**
 - Electric cars are entirely charged by the electricity, meaning there is no need to buy any fuel ever again.
 - Though electricity isn't free, an electric car is far cheaper to run.
- **No Emissions**
 - Electric cars are 100 percent eco-friendly as they run on electrically powered engines
 - It does not emit toxic gases or smoke in the environment as it runs on clean energy source
 - Reducing the carbon footprint and positively affecting the economy
- **Reduced Noise Pollution**
 - Electric cars put curb on noise pollution as they are much quieter
 - Electric motors are capable of providing smooth drive with higher acceleration over longer distances
- **Cost Effective**
 - with more technological advancements, both cost and maintenance have gone down making it cost effective
- **Low Maintenance**
 - Electric cars run on electrically powered engines and hence there is no need to lubricate the engines
 - Therefore, the maintenance cost of these cars has come down.

Cons of Electric Vehicles:

- **Short Driving Range and Speed**
 - Most of these cars have range about 50-100 miles and need to be recharged again.
- **Battery Recharge Issues**
 - Lack of attention on building charging infrastructure.
 - An electric car takes about 4-6 hours to get fully charged. Therefore there is a need for dedicated power stations as the time taken to recharge them is quite long.
- **Silence as Disadvantage**
 - Silence can be a bit disadvantage as people like to hear noise if they are coming from behind them
 - An electric car is however silent and can lead to accidents in some cases.
- **Limited seating capacity**
 - They are not meant for entire family and a third person can make journey for other two passengers bit uncomfortable.
- **Not Suitable for Cities Facing Shortage of Power**
 - Cities already facing acute power shortage are not suitable for electric cars.
 - The consumption of more power would hamper their daily power needs.
- **High cost**
 - The primary reason for the current high prices of EVs is the expensive battery

Way forward:

- For EVs to contribute effectively, we need commensurate efforts in developing an entire ecosystem.
- Need to shift the focus from subsidizing vehicles to subsidizing batteries because batteries make up 50% of EV costs.

- Increasing focus on incentivizing electric two-wheelers because two-wheelers account for 76% of the vehicles in the country and consume most of the fuel.
- A wide network of charging stations is imminent for attracting investment.
- Work places in tech parks, Public bus depots, and Multiplexes are the potential places where charging points could be installed. In Bangalore, some malls have charging points in parking
- Corporates could invest in charging stations as Corporate Social Responsibility compliances.
- Addressing technical concerns like AC versus DC charging stations, handling of peak demand, grid stability etc.
- Private investment in battery manufacturing plants and developing low cost production technology is needed.
- India is highly dependent on thermal sources, which account for about 65% of current capacity. As EV adoption increases, so should the contribution of renewables.
- Need for a policy roadmap on electric vehicles so that investments can be planned.
- Acquiring lithium fields in Bolivia, Australia, and Chile could become as important as buying oil fields as India needs raw material to make batteries for electric vehicles.
- Providing waiver of road tax and registration fees, GST refunds and free parking spaces for EVs.

Q) What are microplastics ? Discuss the concerns posed by it. What should be the desired plan of action to overcome the threats posed by the same ? (250 words)

Reference

Why this question:

The article discusses in detail A recently conducted study of microplastics in three coastal cities in the country that has found that the population size has a direct impact on the abundance and nature of microplastics on their seashore. It has also been found that fibrous microplastic is more prevalent than granular microplastics on Indian shores.

Key demand of the question:

Answer is straightforward and is about discussing the concept of microplastics and the issues associated with it along with suggestions of what needs to be done to overcome the menace.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines highlight the context of the question.

Body:

- In brief discuss what you understand by microplastics? – Microplastics are tiny particles which are present in many sources, including carry bags and pet bottles. These tiny particles easily pass through water filtration systems and end up in the water bodies, posing a potential threat to aquatic life. Microbeads, a kind of microplastic, are used as exfoliates in some cleansers and toothpastes. Even though banned in US and Canada, microbeads are still used in India.
- How harmful is it? – Microplastics can migrate through the intestinal wall and travel to lymph nodes and other bodily organs, shows the Orb report. Microplastics have also been shown to absorb toxic chemicals linked to cancer and other illnesses, and then release them when consumed by fish and mammals. So if plastic fibers are in your water, experts say they're surely in your food.
- What are the concerns? – It holds the potential for both bioaccumulation and biomagnification.
- What needs to be done?
- Regulations on use of plastics in general and microplastics in particular should be put in place by the government.
- Alternatives should be found to tackle with rising consumerism and the increasing use of plastic in everyday life.
- Invention of new, more readily degradable bio-based materials for the plastics could be a way.
- The entire flow chain from manufacturer to the user to the waste collector and the recycling authority should be made aware of the risks.

Conclusion:

Conclude with way forward.

**Introduction:**

- Microplastics are small plastic particles in the environment that are generally smaller than 1mm down to the micrometer range. Microplastics can be formed by fragmentation of large plastic waste material.
- Microfibres from washing of textiles, microbeads used in cosmetics and even paint from land run-offs can dump microplastics in the ocean. According to a 2017 International Union for Conservation of Nature (IUCN) report, microplastics are estimated to constitute up to 30% of marine litter polluting the oceans.

Body:**Concerns posed by Microplastics:**

- Microplastics escape the filtration and treatment processes for waste water and end up in sites of nature.
- This is resulting in significant global impacts on wildlife from marine environment pollution.
- Microplastics are killing the fish before they reach reproductive age, stunted growth and altering the behaviour in some fishes.
- Microplastics are found in the viscera of dead sea birds, reptiles like turtles, whales etc.
- World's coastal countries currently do not have the concerned recycling policies nor the technical capabilities, and so large quantities of plastic are not recycled and enter landfill.
- The durable properties of plastics make them persistent and slow to degrade in the environment entering the food chains.
- It holds the potential for both bioaccumulation and biomagnification.
- Once the microplastics enter foodchain, they carry synthetic chemical compounds such as PCBs and PAHs, which are carcinogenic.
- Unlike POPs (Persistent Organic Pollutants) or chlorofluorocarbons (CFCs), Plastic pollution has received little attention in terms of international agreements.
- **Microplastics make up 94 percent** of an estimated 1.8 trillion pieces of plastic in the patch. But that only amounts to eight percent of the total tonnage

Measures needed:

- Local actions are required for mitigating plastic pollution, using mechanisms such as bans on plastic bags, maximum daily limits for emissions into watersheds, and incentives for fishing gear retrieval.
- Microbeads in cosmetics, daily use items must be banned globally.
- Countries should come together to establish measurable reduction targets for plastic waste. A meaningful international agreement—one with clearly defined waste reduction targets is the need of the hour.
- Effective policies must take into account all stages of the lifecycle of plastic—connecting producers to users and ultimately to waste managers.
- Nonprofits like 5 Gyres are now pushing an agenda toward public awareness, corporate responsibility and the idea of a circular economy — an economy that focuses on keeping waste to a minimum while maximizing materials' use.
- Fossil fuel subsidies incentivise the plastic market. Hence, Countries should end fossil fuel subsidies. Annually, 4–8% of oil is used to produce raw plastic.
- India has a major problem dealing with plastics, particularly single-use shopping bags that reach dumping sites, rivers and wetlands along with other waste.
- The most efficient way to deal with the pollution is to control the production and distribution of plastics.
- Banning single-use bags and making consumers pay a significant amount for the more durable ones is a feasible solution.
- Enforcing segregation of waste will retrieve materials and greatly reduce the burden on the environment.
- Waste separation can be achieved in partnership with the community, and presents a major employment opportunity.
- Eco-friendly substitutes (cloth/paper/jute bags, leaves/areca leaf plates, paper straws) should be developed. For this, scientific and financial support (soft loans and subsidies) is required.

Conclusion:

- Marine plastic pollution is a “planetary crisis,” and we should hope for a “Paris-style” global treaty aimed at tackling it. We cannot transform our world into a ‘plastic planet’. What is needed is collective public effort to stop plastic pollution and safeguard our ecosystem/biodiversity.

Q) According to a new study released by the World Resources Institute (WRI), India's forest cover stands at 21% against global standard of 33.3%. Critically analyse the alarming situation of India's declining forest cover. What needs to be done ? (250 words)

[Indiatimes](https://www.indiatimes.com)

Why this question:

The question is to debate the current alarming conditions of forest cover in India.

Demand of the question:

The answer must explain the current conditions of the forest cover, reasons that have lead to the decline and suggestions as to what should be the way forward to tackle the alarming issue.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

The answer to the question must have the following parts:

- Quote the report and facts of it – World Resources Institute (WRI), India's forest cover stands at 21% against global standard of 33.3%.
- Discuss what are the reasons causing the decline in the forest cover?
- What are its consequences?
- What needs to be done to overcome the alarming issue?

Conclusion:

Conclude with what should be the way ahead.

Introduction:

- Forests are among the first casualties as human populations explode. It is estimated that between 1950 and 1980, around 50 lakh hectares of forestland was diverted for non-forestry activities and India is unable to reach the national goal of 33 per cent.
- Yet forestlands continue to be diverted for non-forestry purposes in an ad hoc manner. In the light of the contemporary challenges like climate change, human-wildlife conflict, intensifying water crisis, increasing air and water pollution and deteriorating environment, urgent action is required to conserve and grow the forest cover.

Body:

- The Global Forest Watch (GFW) released by World Resources Institute (WRI) reveals that India has lost over 1.6 million hectare of tree cover between 2001 and 2018, about four times the geographical area of Goa.

Findings of the report:

- In India, five north-eastern states — Nagaland, Tripura, Meghalaya, Mizoram and Manipur — were responsible for over 50% of all tree cover loss in the same period.
- The main reason for loss of tree cover in the north-eastern states is diversion of forest land and climate change.
- The loss of tree cover contributed to 172 MT of carbon emissions in India during this period.
- The analysis reveals the total tree cover which used to be 12% of the country's geographical area in 2000 reduced to 8.9% in 2010.

Challenges leading to alarming situation of declining forest cover:

- There have been instances of private players displacing tribal communities from the forests and cutting down forests for industries.
- The ecosystem services performed by plantations that have a lot of trees grown for commercial purposes cannot be equated with those of an undisturbed assemblage of plants, trees and animals.
- A flawed definition of "forest cover" allows the government to claim growth in total forest cover despite large-scale deforestation.
- India's forest cover could actually be masking massive deforestation as the areas that have turned green are not necessarily natural forests, but plantations
- Environmental economists have come to regard the calculation of national accounts of wealth and development as weak, because governments do not add the benefits of functions such as flood control and climate moderation to the value of forests.

- Rotational felling of trees by forest departments, diversion of forest lands for developmental activities, submergence of forest cover, agriculture expansion, biotic pressures and natural disasters as other reasons for the decrease in the forest cover.
- There have been instances of violation of forest right act, even the CAMPA act, land acquisition rules and regulations.
- The latest draft forest policy overlooks the ecological and social implications of carbon and production forestry and the need for decentralised democracy.

Measures needed:

- India must review the programmes that it has been pursuing to revive forests, and move away from monoculture plantations that are favoured by even forest development corporations in many States.
- Scientific reforms to bring true nature back are needed.
- The latest assessment categorises more than 300,000 sq km of area as open forests with a tree canopy of 10-40%. These lands provide the opportunity to bring back diverse, indigenous trees.
- Such a measure, combined with a policy against allowing open cast mining, can bring about a renaissance.
- Dedicated efforts will be required to protect the precious forests of the Northeast.
- The forest policy must be prepared by involving the stakeholders viz. people along with the state.
- Community-led initiatives have successfully regenerated forests by adopting sustainable- use practices, regeneration through traditional knowledge of forests and species, guarding and penalizing poachers, among others. These must be promoted.
- Innovative solutions like Tree Ambulance in Tamil Nadu must be emulated across the country.
- Identify and reduce the dependency. For instance fuel wood via LPG connections and promoting fast growing timbers in forest fringes, Grazing via stall feeding or rotational grazing, controlling commercial exploitation of forests, adopt zero-tolerance to fires setting targets to reduce fires by 50%, 25% to 10% etc.
- Increase surveillance and setup legal cell in forest department to follow-up on court cases

Conclusion:

- India's diverse forests support the livelihoods of 250 million people, providing them firewood, fodder, bamboo, beedi leaves and many other products. The timber currently benefits the state treasury. There is a need of revamping India's forest policy.

Q) "India's climate adaptation needs are high but also diverse given the bio-geographic and climate variations." Discuss. (250 words)

Reference

Why this question:

The article discusses in detail the case of Climate change knowledge management in India.

Key demand of the question:

The answer must evaluate how India's climate adaptation needs are high but also diverse, given the bio-geographic and climate variations.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines explain what you understand by the question; climate change knowledge, its application in India.

Body:

Body of the answer to capture the following dimensions:

- What is Knowledge management? – Knowledge management is an important component in technical assistance programmes on climate change, which aims to capture good practices for feeding into development policies and programmes and support capacity building.
- What is the Indian case? – the bio-geographic and climate variations from the coasts to the Himalayan mountain ranges, and average annual rainfall pattern varying from 300 to 3,000 millimeter (mm). Explain that There is a deficiency of knowledge products on climate change impacts, vulnerability assessment and cost-effective adaptation and resilience planning.

- Highlight what are the policies in this direction? – National Mission on Strategic Knowledge on Climate Change, what are the mission objectives etc.
- Discuss what needs to be done?

Conclusion:

Conclude with what should be the way forward.

Introduction:

- India has a diverse bio-geographic and climate variations from the coasts to the Himalayan mountain ranges, and average annual rainfall pattern varying from 300 to 3,000 millimetre (mm). The policy of one size fits all cannot be adopted to tackle the climate change effects.

Body:

- Knowledge management is an important component in technical assistance programmes on climate change, which aims to capture good practices for feeding into development policies and programmes and support capacity building.

Current Scenario of Indian Knowledge management:

- There is a deficiency of knowledge products on climate change impacts, vulnerability assessment and cost effective adaptation and resilience planning.
- The PRECIS (Providing REgional Climates for Impact Studies) climate model, published in 2006 and revised in 2012, is still at a very coarse resolution, and the authors from the Indian Institute of Science acknowledge the limitations of climate models on assessing extreme climate projections that are important for adaptation planning.
- The Coordinated Regional Downscaling Experiment (CORDEX) — recently established by the World Climate Research Program (WCRP) and Indian Institute for Tropical Meteorology, with the aim of developing an international coordinated framework to generate improved regional climate change projections world-wide — is yet to publish usable climate change projections for developing adaptation plans in India.
- In absence of information on climate change impacts and vulnerability assessment, State Action Plan on Climate Change (SAPCC) has come up with weak adaptation strategies and unrealistic cost estimates.
- The Climate and Development Knowledge Network (CDKN) has only about 33 knowledge products by itself and 14 by its partner organisation on the theme of adaptation and resilience for India.
- There is also very less documentary evidence on ecosystem-based approaches and traditional knowledge on climate adaptation.

Policies in this direction:

- **The National Mission on Strategic Knowledge on Climate Change (NMSKCC)** was made as one of the eight national missions in the right spirit.
- The mission's objective was to develop knowledge on climate change that can cater to climate action plans.
- It has helped set up knowledge management cells in almost all states to support the research and training activities for implementation of SAPCC.

Some objectives of the NMSKCC are:

- Supporting research work on creating regional climate models to assess impacts on different ecological zones in the country.
- Encouraging research and establishing research networks on impacts of climate change on key sectors (agriculture, health, biodiversity, oceans and coastal systems etc.).
- Create institutional network for knowledge exchange and develop institutional and capacity and human resource development.
- Provide inputs to other national missions.

Challenges of NMSKCC:

- There is no scope for participation of private sector in research and collaborations and partnerships for interdisciplinary research and international cooperation on science and technology.
- Many of the state knowledge management cells are yet to add on repositories on research publications, accessible knowledge products in forms of policy brief, reports and videos.

Way forward:

- Knowledge management on climate adaptation is very essential.
- There is a need to refine the current models on impact assessments.
- Successful pilot projects on adaptation must be promoted, documented and peer reviewed and such knowledge products must be disseminated in widest possible knowledge forums.

- Scientists must also consider making their work on adaptation and resilience accessible and translate to easily understandable knowledge products like blogs and policy briefs.
- Workshops and meetings for knowledge sharing and presentation of best practices must be encouraged.
- South-South and North-South cooperation with developing and developed countries particularly on climate change impact assessments, including using integrated assessment models to assess economic impacts of climate change and evaluating cost benefit analysis of different adaptation options, is essential.
- Exposure visits to countries that have demonstrated projects on climate change adaptation such as Bangladesh would help in knowledge exchange and peer learnings.

Topic: Disaster and disaster management.

Q) Discuss the Significance, composition and key functions of National Crisis Management Committee (NCMC). (250 words)

[Reference](#)

[Reference](#)

Why this question:

Recently the National Crisis Management Committee (NCMC) under the chairmanship of Sh. P. K. Sinha, Cabinet Secretary, met again to take stock of the preparatory measures arising out of the Cyclonic Storm 'Fani'. Thus it is important for us to know the working of NCMC and its importance.

Key demand of the question:

The answer must provide for a detailed explanation about the role played NCMC in handling crisis circumstances like that of cyclone Fani to effectively mitigate such situations.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines about the importance of such committees.

Body:

Answers must discuss the following aspects :

- About NCMC- At the national level, Cabinet Committee on Security (CCS) and National Crisis Management Committee (NCMC) are the key committees involved in the top-level decision-making with respect to Disaster Management (DM). It deals with major crisis which have serious or national ramifications.
- Its composition – Cabinet Secretary (Chairperson). Secretaries of Ministries / Departments and agencies with specific Disaster management responsibilities.
- Its key functions – Oversee the Command, Control and Coordination of the disaster response. Give direction to the Crisis Management Group (CMG) as deemed necessary.

Conclusion –

Conclude with significance of such organs in handling crisis situations.

Introduction:

- A National Crisis Management Committee is a temporary committee set up by the Government of India in the wake of a natural calamity for effective coordination and implementation of relief measures and operations.
- It is headed by Cabinet Secretary. Recently the National Crisis Management Committee (NCMC) under the chairmanship of Sh. P. K. Sinha, Cabinet Secretary, met again to take stock of the preparatory measures arising out of the Cyclonic Storm 'Fani'.

Body:

Significance:

- It is the **country's apex body to handle emergency situations**.
- At the national level, Cabinet Committee on Security (CCS) and National Crisis Management Committee (NCMC) are the key committees involved in the top-level decision-making with respect to Disaster Management (DM).
- It deals with major crisis which have serious or national ramifications.

**Composition:**

A National Crisis Management Committee (NCMC) has been constituted in the Cabinet Secretariat. The composition of the Committee is as under:-

- Cabinet Secretary- Chairman
- Secretary to Prime Minister Member
- Secretary (MHA) Member
- Secretary (MCD) Member
- Director (IB) Member
- Secretary (R&AW) Member
- Secretary (Agri & Coopn.) Co-opted Member
- An officer of Cabinet Secretariat. Convenor

Key functions:

- NCMC reviews the preparedness with the States and concerned Departments of Government of India to deal with the situation arising out of the natural calamities.
- It directs mobilisation of additional resources to all agencies who are engaged in rescue and relief operations
- It looks after the effective implementation of relief measures in the wake of a natural calamity
- NCMC will give such directions to the Crisis Management Group of the Home Ministry as deemed necessary.
- The Secretary (A&C) will be responsible for ensuring that all developments are brought to the notice of the NCMC promptly.

Conclusion:

- Thus, the NCMC plays a vital role in disaster management by overseeing the Command, Control and Coordination of the disaster response.

Q) Underline the development perspective to disaster management with focus on disaster management in coastal regions. (250 words)

Reference**Why this question:**

The question is in the backdrop of recent cyclone Fani that has hit coastal regions of coastal Odisha. Thus it is important for us to evaluate the significance of Disaster management in such regions.

Key demand of the question:

The answer is intended to evaluate the development perspective of Coastal area and the planning and management of the same with a focus on disaster management and the protective role of coastal ecosystem.

Structure of the answer:**Introduction:**

In a few introductory lines narrate the onset of cyclone Fani/ disasters that have been witnessed by coastal regions of India.

Body:

- Explain – The recovery process post such disasters in the coastal regions continue to generate awareness of the need for an integrated approach to decision-making in coastal regions that balances the need to accommodate seemingly conflicting objectives such as ecosystem management, housing and economic development.
- Discuss that analysis of communities that have experienced disasters reveal that too often in the rush to return to “normal,” rebuilding occurs in such a way as to recreate, and often increase exposure to repeat hazards, while not taking into consideration lessons learned from the event such as the protective role of forests and dense vegetation buffers. Such rapid rebuilding tends not to be based on plans developed before the event that identified safety set-back distances, creation of buffer zones and optimal land uses.
- Discuss the Regional Vulnerabilities in Indian scenario with special emphasis on coastal regions
- What are the current institutional arrangements available? What needs to be done to make them better and make them work more effectively? .
- Discuss what should be done to overcome such situations.

Conclusion:

Conclude with need for managing Disasters with focused approach.

**Introduction:**

- Cyclone Fani is only the second severe cyclone in the last 118 years to form in the Bay of Bengal (BOB) in the month of April and cross over to the Indian mainland, according to data from the India Meteorological Department (IMD).
- April cyclones are rare and the track and severity of Fani makes it even rarer. In recent times, cyclones have either had unusual timing, like Cyclone Pabuk in January, or they have intensified rapidly before making landfall, like Cyclone Ockhi in 2017 and Cyclone Titli last year.

Body:**India's key vulnerabilities:**

- Coastal states, particularly in the eastern coast and Gujarat on the west coast are vulnerable to cyclones.
- 4 crore hectare land mass is vulnerable to floods.
- 68% of the net sown area is vulnerable to drought.
- 55% of total area is in Seismic zones –III to V and vulnerable to earthquakes.
- Sub-Himalayan region and western Ghats are vulnerable to landslides.

Disasters lead to enormous economic losses that are both immediate as well as long term in nature and demand additional revenues. Also, as an immediate fall-out, disasters reduce revenues from the affected region due to lower levels of economic activity leading to loss of direct and indirect taxes. In addition, unplanned budgetary allocation to disaster recovery can hamper development interventions and lead to unmet developmental targets.

With the kind of economic losses and developmental setbacks that the country has been suffering year after year, the development process needs to be sensitive towards disaster prevention and mitigation aspects. There is thus need to look at disasters from a development perspective as well.

Current institutional measures to tackle such incidences:

- The **National Cyclone Risk Mitigation Project (NCRMP)**, to be implemented with financial assistance from the World Bank, is envisaged to have four major components:
 - Component A: Improvement of early warning dissemination system by strengthening the Last Mile Connectivity (LMC) of cyclone warnings and advisories.
 - Component B: Cyclone risk mitigation investments.
 - Component C: Technical assistance for hazard risk management and capacity-building.
 - Component D: Project management and institutional support.
- These components are highly interdependent and have to be implemented in a coherent manner.
- In 2016, **National Disaster Management Plan** was unveiled to tackle disaster. It provides a framework to deal with prevention, mitigation, response and recovery during a disaster.
- The **NDMA** had come up with its **National Guidelines of Management of Cyclones in 2008**. The basic premise of these guidelines is that the mitigation has to be multi-sectoral.
- Developing Integrated Coastal Zone Management (ICZM) frameworks for addressing the sustainability and optimal utilisation of coastal resources as also cyclone impact minimisation plans.
- Ensuring cyclone resistant design standards are incorporated in the rural/ urban housing schemes in coastal areas
- Implementing coastal flood zoning, flood plain development and flood inundation management and regulatory plans.
- Coastal bio-shields spread, preservation and restoration/ regeneration plans.
- There is a need for private sector participation in designing and implementing policies, plans, and standards.
- Need of Disaster Management program to be inclusive including women, civil society, and academia.

Way forward:

- For addressing natural calamities such as floods and drought, there already exist a number of plan schemes under which a lot is being done and can be done.
- State Governments need to make full use of the existing plan schemes and give priority to implementation of such schemes that will help in overcoming the conditions created by the calamity.
- Reconstruction efforts must involve rebuilding in a better way. Climate proofing in Kerala calls for structures to be built with wind- and water-resistant materials.
- People need to relocate out of harm's way. During the 2015 floods, Chennai illustrated the price of unrestricted urban development.

- Early warning is vital. Because of investments in these systems, Cyclone Phailin (2013) claimed less than 40 lives in Odisha. In Kerala, there was no timely forecast from national weather services. The State needs a reliable flood forecasting capability.
- There needs to be tougher implementation of logging and mining regulations in fragile ecologies. Deforestation worsened the effects of Kerala's floods and mudslides, as the report of the Western Ghats ecology expert panel 2011 had warned.
- Non-structural measures for flood forecasting provide early warning in flood prone areas have proved to be successful for flood management. High-tech warning systems on the ground will not be useful until the authorities, key stakeholders and communities are trained to act upon the information obtained from these facilities.
- Different stakeholders need to come together for mapping risks, vulnerabilities, and resources, engage in regular preparedness actions like drills and capacity building, develop and update emergency plans, check the availability of resources at the local level and act upon early warning intimations.

Conclusion:

- India should prepare to mitigate and deflect the destruction caused by Cyclones. We need to employ technology, strict following of command structure and most importantly the participation and cooperation of local communities in the affected area.

Q) Discuss the importance of 'Climate resilience' in the eventualities of disasters. Explain how building climate-resilient structures aid to minimise long-term cost of reconstruction in the disaster hit regions. (250 words)

Reference

Why this question:

The article discusses in detail the commendable emergency response to cyclone Fani that saved lives in Odisha, and how now the state must build climate-resilient structures to minimize long-term cost of reconstruction.

Key demand of the question:

The question expects us to elaborate on the concept of climate resilience and one must state the significance of the same in the event of the onset of Disasters like that of cyclone Fani.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with what you understand by climate resilience.

Body:

Discussion should include the following aspects –

- What do you understand by Climate resilience? -Climate resilience can be generally defined as the capacity for a socio-ecological system to:
 1. absorb stresses and maintain function in the face of external stresses imposed upon it by climate change and
 2. adapt, reorganize, and evolve into more desirable configurations that improve the sustainability of the system, leaving it better prepared for future climate change impacts.
- What is climate resilient infrastructure? -Climate Resilient Infrastructure. Infrastructure by its very nature, and often by design, is vulnerable to the impacts associated with climate change. 'Climate resilient' infrastructure can safeguard and strengthen developing countries' economic growth from current and future climate impacts.
- Explain the significance of having climate resilient infrastructure.
- Discuss how it addresses vulnerability.
- Discuss the case study of cyclone Fani to justify the answer better.

Conclusion:

Conclude with a reassertion that climatic resilience is of utmost importance.

**Introduction:**

- Climate resilience can be defined as the capacity for a socio-ecological system to absorb stresses and maintain function in the face of external stresses imposed upon it by climate change and adapt, reorganize, and evolve into more desirable configurations that improve the sustainability of the system, leaving it better prepared for future climate change impacts.

Body:**Importance of Climate resilience:**

- As greenhouse gas emissions continue to rise, climate change will continue to accelerate.
- Climate change poses a serious threat to efforts to reduce global poverty. According to the United Nations International Panel on Climate Change, the changing climate will have widespread effects on human life and ecosystems. It brings heat waves, flooding, droughts, intense tropical cyclones, rising sea levels, and damages biodiversity.
- Recently study in Nature regarding Climate Change identifies India as the country with the most expected damage from rising levels of carbon dioxide.
- Climate resilience is often associated with acute events – like heavy downpours, hurricanes, or wildfires – that will become more frequent or intense as the climate changes.
- The UN Sustainable Goals Report, 2018 notes that climate change is among the key factors in rising hunger and human displacement. The World Health Organisation estimates that climate change will cause an additional 250,000 deaths per year between 2030 and 2050, due to malnutrition, malaria, diarrhoea and heat stress.
- The World Bank projects that climate change could cost India 2.8% of its GDP, and diminish living standards for nearly half the country's population, in the next 30-odd years.

Climate resilient infrastructure:

- Infrastructure by its very nature, and often by design, is vulnerable to the impacts associated with climate 'Climate resilient 'infrastructure can safeguard and strengthen developing countries' economic growth from current and future climate impacts.
- Climate resilient infrastructure is important in the light of extreme weather events , global warming leading to sea level rise, adequate disaster preparedness, prevention of economic losses, minimal disruption to society.

Climate resilient infrastructure and cost reductions:

- During intense storm surge vulnerable regions are susceptible to instantaneous damage to infrastructure. These regions need quick adoption of design standards to withstand storms, and adapt to high wind speed, heavy rain and flooding to reduce damage.
- Indian Road Congress guidelines, which govern road design, are being revised for adoption of climate resilient guidelines for roads and drainage. This is considering resilient design standards and material for road infrastructure.
- Road-building will have to be aligned with improved drainage system. Street design, mobility alignment, and public transport will have to reflect special needs during climatic stress.
- Design guidelines will also have to improve and augment drainage capacity and link it with water recharge and storage.
- Flood risk assessment and flood plain management must also be mandatory. Assessment of vulnerability can govern development along shore line and vulnerable areas to enhance protection and hedge risk.
- Case-Studies:** Hong Kong has overhauled its drainage infrastructure. It has innovatively implemented Happy Valley Underground Stormwater Storage Scheme, constructing beneath several sports fields.
- Copenhagen is using the method of "fight flooding with flooding" by lowering its parks and raising sidewalks connected to parks. During extreme downpours, the parks will turn into temporary reservoirs and storage for recharge while the streets will channelise water towards the city's harbour.

Way forward:

- It is critical to invest in climate-smart infrastructure like water management, transport, and energy because they provide critical social and economic services not only to the city but also to regions beyond that. These need to be done now because changing them requires a significant amount of lead time to design and implement
- There is a need to build the principles of climate resilience into coastal infrastructure development. This would mean incorporating them into already-existing urban infrastructure. For future infrastructure development, climate resilience will need to be built in right from the planning stage.

- Location-specific information within the larger picture of how climate change is affecting or will affect the Indian coast can help planners and administrators to build in climate resilience.
- At present there is no window for financing climate resilient infrastructure, according to the TERI study. One avenue could have been the National Mission on Sustainable Habitat, one of the eight missions initiated under the National Action Plan on Climate Change.
- Both short- and long-term, detailed design features and interventions that would need expert engineering solutions are critical to planning for new infrastructure or retrofitting/climate proofing of existing ones.
- Planning for climate resilience would need to start from the time of locating the infrastructure facilities. For instance, infrastructure for solid waste management, especially landfills, have to be located keeping in mind the projected sea level rise.
- Similarly, planning for climate resilience would mean ensuring water supply channels have back-ups for extreme weather events.

Q) Do you think It's time for the govt to consider Catastrophe bonds, insurance-linked securities with increasing frequency of natural calamities? Discuss in the light of recent disasters that stuck India. (250 words)

Reference

Why this question:

The question is intended to evaluate the need for disaster management in terms of the policies directed and aimed at insuring the regions prone and often affected by disasters like that of Odisha which was recently effected by cyclone Fani causing devastation of the State in terms of loss of life, economy, biodiversity etc.

Key demand of the question:

The answer must discuss the importance of insurance with respect to effective disaster management.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines appreciate the need for Insurance aspect in disaster management.

Body:

- Explain what are Catastrophe bonds? – A typical CAT or cat bonds has a maturity of three years during which the period should be a tightly defined disaster. CAT is like junk bonds in terms of riskiness and hence the high yield expected.
- Discuss in what way insurance-linked securities with increasing frequency of natural calamities can help and provide better management aspects post disaster to restore life and economy of a region to its normalcy.
- Suggest solutions and lessons from countries across the world using such principles in Disaster management.

Conclusion:

Conclude with way forward.

Introduction:

- A catastrophe bond (Cat bond) is a **high-yield debt instrument** designed to raise money for companies in the insurance industry in the event of a devastating natural disaster. A CAT bond allows the issuer to receive funding from the bond only if specific conditions occur such as an earthquake or floods.
- CAT bonds have **short maturities not exceeding three to five years**. The primary investors in these securities are hedge funds, pension funds, and other institutional investors.

Body:

Need for Insurance aspect in disaster management:

- The economic cost of disasters averages \$250 billion to \$300 billion annually, according to the 2015 **United Nations Global Assessment Report on Disaster Risk Reduction**.
- Considering that only about 30% of the damage from natural disasters are insured, such losses can impose severe financial burden on governments.

- In developing countries, governments may have to divert state funds, including those earmarked for development projects, to disaster relief and rebuilding efforts.
- The catastrophe bonds, a debt instrument allows governments to tap the capital market and raise money from investors willing to bet against the likelihood of a disaster occurring in a particular place during a particular time period.

It is high time that such instruments are introduced in India so that relief and reconstruction work in areas affected by natural disasters goes on unimpeded and are not stalled for only want of capital. Rebuilding from floods will only become more costly for taxpayers in the years ahead. Many analysts expect large, unpredictable storms to become more frequent as seas get warmer.

Features of Catastrophe Bond:

- CAT bonds have short maturities not exceeding three to five years.
- The primary investors in these securities are hedge funds, pension funds, and other institutional investors.
- Catastrophe bonds are used by property and casualty insurers as well as reinsurance companies to transfer risk to investors.
- These bonds provide insurance and reinsurance companies with another method to defer risk associated with underwriting policies.
- In return, institutional investors receive a higher interest rate than most fixed-income securities over the life of the bond, which could have a maturity of up to five years.
- CAT bonds are only paid to the insurance company if a triggering event happens.

Advantages and Disadvantages:

The upside

- Cat bonds can be an effective tool to address the risk of loss and damage from climate change because it allows vulnerable countries to raise capital that can be disbursed quickly in the event of a catastrophe.
- This is because cat bonds can be structured to allow payouts as soon as pre-defined trigger events occur.
- Cat bonds can also provide multi-year coverage to the issuing governments.

The downside

- There are challenges for the more widespread use of cat bonds because of their high transaction costs, long structuring period that can take months, and strict terms and conditions compared with traditional risk financing, such as insurance.
- In addition, cat bonds do not always meet countries' needs, as governments may prefer longer term protection, while investors tend to prefer shorter term bonds.
- Another obstacle is that cat bonds are usually available only to institutional investors, limiting their market reach.

Way forward:

- There is no reason why governments themselves cannot issue CAT.
- For example, Odisha is prone to periodic cyclone with the recent Fani cyclone wrecking havoc on properties though, thanks to high preparedness, loss of human lives was minimal.
- Odisha government itself can take the initiative and issue Odisha and cyclone-specific CAT.
- A longer duration bond would be beneficial to it i.e., instead of a three-year bond if it issues a five-year bond, the chances of cyclone hitting coastal Odisha is higher and hence the success of the exercise (loss mitigation) greater.

Q) Numerous types of damages are necessary to be measured for undertaking effective damage assessment during disasters. Discuss. (250 words)

Reference

Why this question:

The question is to evaluate the concept of damage control in disaster management.

Key demand of the question:

Analyse in detail the need for damage control in effectively mitigating disasters and managing the disasters effectively.

**Directive word:**

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines highlight the recent cyclone Fani that struck the East coast necessitating us to analyse the need for disaster control and damage control.

Body:

In brief discuss –

- The example of Odisha's successful disaster management policy is a template that other vulnerable Indian states as well as other parts of the world should closely follow.
- What are the pathways to effectively control and manage disasters? – discuss the need of understanding the types of damages- Infrastructure; Electricity and telecommunications, need for restoring damaged highways and district roads, health system etc.
- Use the Odisha cyclone as a case study to best explain the answer.
- Highlight the learnings, discuss what should be the way forward.

Conclusion:

Conclude by reasserting that understanding disasters is of prime importance to resolve and fix them..

Introduction:

- The eastern coast of India has had to bear the brunt of nature's fury yet again. Cyclone Fani hit Odisha recently, and though its menace as a storm was downgraded from "extremely severe" to "very severe" a few hours after it made landfall, it has left a trail of destruction that should make us revisit what we mean by "preparedness".

Body:

- Cyclones are among the most dangerous and most destructive natural disasters that can occur. They have been responsible for about 1.9 million deaths worldwide over the last two centuries, and it is estimated that 10,000 people are killed each year by these storms. Cyclones tend to do the most damage in coastal areas, where they have been known to alter the landscape and remove forest canopy. 13 coastal states and Union Territories in the country are affected by Tropical Cyclones (TCs).

Cyclones bring devastations and damages of various types:

- Life:
 - Cyclones often cause loss of life, heavy damages in built environments, and have negative effects on shipping,
 - The death toll due to cyclone Fani rose to 64 with 21 fresh deaths confirmed, nine days after the 'extremely severe' cyclonic storm devastated coastal Odisha.
- Property:
 - The strong winds of cyclones can cause damage over an area of 25 km in smaller systems and up to 500 km in larger systems. Winds have been known to destroy smaller buildings and knock out power for thousands of people.
- Infrastructure, Electricity and telecommunications:
 - Infrastructure facilities like ports, airports are at the highest risk of damage. The casualties include that of the electricity and telecom infrastructure too rendering the places devoid of communication.
- Fisheries and tourism:
 - Statistics show that the global average annual losses from cyclones and storm surges are estimated at US\$ 80 billion.
- Temperature:
 - Tropical cyclones can quickly change the environment of the affected areas. They can bring warmer air into hot places. This makes the atmosphere feel very sticky and muggy and rises the temperature dramatically. This can cause heat strokes and other heat related illness to children and the elderly after the storm which is not good.
- Storm surge:
 - Potentially disastrous surges occur in coastal areas with low-lying terrain that enables inundation. The storm surge is typically the most damaging effect of cyclones, historically resulting in 90 percent of tropical cyclone deaths.

- When combined with strong winds, storm surges can produce massive waves that can cause inland flooding and destruction.

Measures to be taken:

- Effective coordination between the governments at the Center and state to take up the rescue and relief work immediately.
- There is a need of harmonizing the national and local level disaster resilient bylaws, land use zoning, resource planning, early warning system establishments and technical competence.
- Restoration of the basic necessities like electricity, water supply and telecom facilities at the earliest.
- **Assessment of houses damaged:** as most of the affected are left homeless, they will be vulnerable to all kinds of dangers. An effective assessment of the damage can help the government to plan its efforts better.
- **Construction of disaster resilient houses** in cyclone prone areas must be mandated to avoid the recurrent expenditures and provide a safe shelter to the people.
- The government should take commonalities from success stories and institutionalize it. For example, Built Back Better Program of Gujarat government after 2001 earthquake.
- Disaster Risk Reduction should be an important aspect of global poverty reduction initiatives.
- Moving from a risk blind approach to a risk-informed decision when it comes to investments.
- There should be a Disaster Risk Audit for the future developmental project for both public and private entities.
- Disaster Risk Reduction program should be more **people-centric**.
- There is a need for **private sector participation** in designing and implementing policies, plans, and standards.
- Need of Disaster Management program to be inclusive including women, civil society, and academia.
- State governments should increase their engagements in scientific research institution for a better formulation of policies.

Conclusion:

- Natural disaster comes without warning. India should prepare to mitigate and deflect the destruction caused by Cyclones. India needs to employ disaster resilient technology, strict following of command structure and most importantly the participation and cooperation of local communities in the affected area.

Q) Evaluate the role of Women in disaster management. Justify your answer with suitable examples. (250 words)

The hindu

Why this question:

The article discusses in detail how women can play a role centric to managing disasters. Recently a project named 'swayamsiddha' in Odisha's Ganjam district was initiated wherein women will be trained in evacuation, rescue, restoration and rehabilitation during natural calamities, especially cyclones.

Key demand of the question:

Discussion should be about vital role that women can play in managing disasters.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines highlight how Multi-stakeholder engagement is a fundamental element to managing disasters.

Body:

Many international strategies and frameworks have identified women as one of the key stakeholders in any disaster management efforts due to many reasons. Women play a significant role in disaster response and recovery stages specifically at household level. However, their roles in organizational decision making, particularly in disaster risk governance, is limited due to uncovered reasons. This has created equity and equality issues among one of the most affected communities from hazards.

The answer must attempt to explore and emphasize the role of women in disaster risk governance, risk governance efforts and overall disaster management and to uncover the barriers that limit their role in disaster risk governance.

Use examples from the article – Kerala floods, Odisha cyclone etc. to justify your answer.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- India is one of the most vulnerable countries to natural disasters. The country has faced a number of natural disasters in the last decade which have claimed hundreds thousands of precious lives and heavy economic losses. It has been observed that more than half of the victims in the past disasters were women.
- Women are seen in their traditional role of home-makers, but their ability to take on managerial roles in disaster risk management cannot be underestimated.

Body:

Factors determining the role of women in Disaster management:

- **Patriarchal culture:** Many researchers have identified patriarchal culture as a major barrier that prevent or limit the role of women as decision makers or leaders. Some societies accept that wives and daughters as subordinate to husbands and
- **Religious believes:** Religious believes influence the role of women in public engagement and decision For example, Protestantism promotes and accepts women as religious leaders compared with Catholicism and Orthodox Christianity which limit their involvement
- **Structure of the family:** Studies found that size of the family and its composition similarly affect the decision making power of women in households specifically in developing countries
- **Household work load:** Traditional societies expect the role of women to engage only in family work related to child baring, caring and kitchen works
- **Level of education:** Level of education is an individual characteristic. According to Hora, lack of adequate level of education among women in Ethiopia was one of the major factor that prevent women participating in leadership and decision making role
- **Policies and legislations:** There was a target of 30% women representation in leadership positions endorsed by the United Nations Economic and Social Council in 1990 and reaffirmed in the Beijing Platform for Action in However, the reality is far more behind from its expected level.
- **Household income:** Poor socio-economic status affects lower level of engagement of women in decision making at house hold level
- **Political environment:** Women in political positions are important not because of its strategic importance, but for the benefits and its impact

Role played by women in disaster management:

- Although women's social, economic and political position in society makes them more vulnerable to natural hazards, they are not helpless victims.
- Women are important agents for change and need to be further strengthened as such.
- Recognizing and mobilizing their skills and capacities as social force and channelling it to enhance efforts to protect their safety and that of their communities and dependents is a major task in any disaster reduction strategy.
- Indian women are the backbone of the rural subsistence economy. Their respective role in family which is of productive nature to a large extent makes the family and society sustainable but it is not acknowledged by and large.
- Women's work in agriculture is often seen as an extension of their domestic responsibilities, rather than a separate economic activity. In rural areas which are more vulnerable to natural hazards since rural population depend more on the natural resource base for all aspects of life. Securing food, water and fuel are key community concerns, which are predominantly taken care of by women.
- There are many examples of women's informal community involvement in disaster reduction, but women are still largely excluded from formal planning and decision-making and need to be empowered to do so
- This is essential to ensure effective disaster reduction policies. If some decision-making is shifted Emergency relief and aid processes particularly disadvantage women who must organize food provision, shelter, and child and family care according to chaotic aid-delivery systems and entitlement procedures that rarely take their work or opinions into account.
- Although women commonly organize themselves to distribute supplies, establish shelter, and pool labour and resources to create community support services to meet basic family needs in the emergency period, their efforts are often invisible or go unacknowledged.

Challenges faced:

- Indian women face a number of hurdles in applying and qualifying for aid after a disaster this primarily because of illiteracy or limited literacy, limited access to information on how to apply and navigate the bureaucracy in addition to the eligibility requirements.
- In majority of instances it has been found that relief and rehabilitation schemes favour men over women, where priority has been given to property owners, tenants of record, bank-account holders, and perceived heads of
- Women's economic condition becomes critical because in large number of cases employment assistance concentrates on workers in the formal economy and business aid is awarded to formal enterprises.
- Post disaster aid and investments generally undermine women's collective capacity to surmount day-to-day problems adversely affecting the economic base of women.
- There is no consideration for women's productive and reproductive activities as far as conventional disaster response in India is concerned, It is not at all reflect how important housing and informally held resources and assets are to women's
- They have to face loss of workspace, tools, equipment, inventory, supplies and markets or even domestic violence

Way forward:

- To identify the barriers that prevent their role in decision making, governance and any Disaster management efforts.
- Based on the literature review, following barriers are identified socio-cultural factors, socio-economic factors, individual characteristics and legal and institutional factors.
- Gender issues must be urgently and effectively integrated into disaster research, planning, and organizational practice.

Conclusion:

- It has been noticed that women's groups that participate in emergency relief, resettlement, and reconstruction efforts following a natural disaster acquire significant knowledge and expertise that can greatly benefit communities that subsequently experience similar crises.
- When mechanisms are established for promoting the transfer of this knowledge from community to community, poor women are enabled to come out of their homes and form groups to assess their situation, organize, and participate in the range of decisions and programs.
- When disasters strike, the opportunities to decrease women's marginalization arise early on, when norms of social control and male-dominated family structures are temporarily disrupted and weakened by the chaos that ensues.
- If affected women can meet and benefit from the experiences of other women who have managed to deal successfully with disaster-related issues, much valuable time can be saved and mistakes avoided.

Case Study:

- *In Maharashtra and Gujarat states of India a number of non governmental organizations involved who encouraged local women to participate in relief and recovery operations after earthquake occurrence.*
- *They made various groups to build the skills and capacities required to train the members for post disaster recovery to long-term development.*
- *The remarkable work by an Ngo called **Swayam Shikshan Prayog** (translated as "learning from one's own and others' experiences") which had more than 15 years experience of working for women and poor communities in rural India proved the capability of women in handling disasters.*
- *In 1993 Latur Maharashtra earthquake, they contributed in repairing and strengthening of damaged houses. In 2001 Bhuj, Gujarat earthquake the grassroots women's groups from Maharashtra travelled to this neighbouring state to share experiences and pledge long-term assistance.*

Q) What is Global Facility for Disaster Reduction and Recovery ? Discuss its objectives. Also explain the role played by India. (250 words)

Reference

Why this question:

Recently India has been unanimously chosen as co-chair of the Consultative Group (CG) of Global Facility for Disaster Reduction and Recovery (GFDRR) for the fiscal year 2020.

Key demand of the question:

The answer must discuss in detail is Global Facility for Disaster Reduction and Recovery and its objectives along with the significant role played by India in this direction.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer

Introduction:

write a few introductory lines about is Global Facility for Disaster Reduction and Recovery.

Body:

Answers must discuss the following aspects :

- What is it? It is a grant-funding mechanism, managed by the World Bank, that supports disaster risk management projects worldwide.
- Objectives: GFDRR is a global partnership that helps developing countries better understand and reduce their vulnerability to natural hazards and climate change.
- Present status: It is presently working on the ground with over 400 local, national, regional, and international partners and provides knowledge, funding, and technical assistance.
- Explain the role India has to play with respect to it.

Conclusion –

Conclude with way forward.

Introduction:

- Global Facility for Disaster Reduction and Recovery (GFDRR) is a global partnership that helps developing countries better understand and reduce their vulnerability to natural hazards and climate change.
- It is a grant-funding mechanism, managed by the World Bank, that supports disaster risk management projects worldwide. India has been unanimously chosen as co-chair of the Consultative Group (CG) of Global Facility for Disaster Reduction and Recovery (GFDRR) for the fiscal year 2020.

Body:

- GFDRR contributes to the **implementation of the Sendai Framework for Disaster Risk Reduction** by helping countries to integrate disaster risk management and climate change adaptation into development strategies and investment programs and recover from disasters quickly and effectively. India became a member of CG of GFDRR in 2015.
- Role of GFDRR: It provides technical assistance, capacity building, and analytical work to help vulnerable nations improve resilience and reduce risk.

Objectives:

- To mainstream disaster reduction and climate change adaptation (CCA) in country development strategies, and
- To foster and strengthen global and regional cooperation among various stakeholders under the International Strategy for Disaster Reduction (ISDR) system.
- To help developing countries better understand and reduce their vulnerability to natural hazards and climate change.

Role played by India:

- The Consultative Group (CG) is GFDRR's primary decision-making and advisory body.
- This is the first time that India has been provided with the opportunity of co-chairing the CG meeting of GFDRR.
- The opportunity will give India a chance to work with the member countries and organizations of GFDRR with a focused contribution towards advancing the disaster risk reduction agenda during the course of the year.
- India's objective is to pursue a focused agenda and develop synergies with ongoing work streams of GFDRR. Disaster Resilient Infrastructure (DRI) will be a central theme of engagement with the GFDRR partners and stakeholders.

**Conclusion:**

- India is prone to many natural disasters which has huge socio-economic impacts. The opportunity to do such a role gives India to build her capacity to reduce vulnerability to natural hazards and climate change better.
- India can set an example by understanding disaster risk, strengthening disaster risk governance to manage disaster risk, investing in disaster risk reduction for resilience and building back better in recovery, rehabilitation and reconstruction.

Q) “There have been numerous fire accidents this year causing significant loss of life and property. While the government and other regulatory bodies have prescribed norms and fire safety measures, implementation and vigilance continue to be grave concern.” Critically analyse. (250 words)

The hindu

Why this question:

At least 20 students were killed, either due to suffocation or falling off the windows in an attempt to escape fire in a coaching centre blaze, in Surat yesterday. Such a disturbing incident necessitates us to take a look at the fire safety aspects of the country and the lacunae therein.

Demand of the question:

The answer must discuss the issues involved and causes for such recurrent fatal fire incidents and the need for overhaul of measures and norms in place to overcome such disasters.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

The answer to the question must have the following parts:

- Quote the recent incidences that were witnessed.
- Discuss how such fatal fire incidents necessitates a relook at the current rule, regulations and norms that are almost defunct in practice and corrective measures for the same.
- Discuss who all are vulnerable to it, stakeholders involved.
- What needs to be done to overcome the alarming issue?
- Discuss the institutional mechanisms, health and disaster management aspect of both life and property.

Conclusion:

Conclude with what should be the way ahead.

Introduction:

- In India, although there are many rules and regulations, codes and standards related to fire safety, these are seldom followed. Laxity in fire safety measures caused major fires in many buildings.
- A recent fire incident at a coaching centre in Surat resulted in the death of 22 students. Such a disturbing incident necessitates us to take a look at the fire safety aspects of the country and the lacunae therein.

Body:**Fire Accidents in India:**

- According to National crime records bureau figures 17,700 Indians died and 48 people every day due to fire accidents in 2015.
- Of those who died, 62% were women.
- Maharashtra and Gujarat, the two most highly urbanised states, account for about 30% of the country’s fire accident deaths.
- According to India Risk Surveys 2018, outbreak of fire poses risks to business continuity and operations and ranks India at 3rd position in fire incidents, especially in Northern and Western regions of India.

Lacunae in Fire Safety in India:

- Violation of safety norms and lack of standardisation and regulation is a major cause of fire accidents, as large scale construction of false roofs in commercial buildings and multiplexes is against the national building construction code.

- High rise buildings are more prone to fire accidents as they lack an adequate in-built fire protection system that makes salvaging operations difficult.
- Poorly stored goods, even though they are not flammable, helps to spread fire and hinder fire fighters gain access to the seat of the fire or reduce the effectiveness of sprinkler systems.
- Unclear provisions of fire safety audit in terms of scope, objective, methodology and periodicity of a fire safety audit.
- Lack of adequate resources, preparedness and poor fire services fail to ensure fire safety cover to the population.
- Lack of awareness about the safety arrangements before purchasing or hiring a flat in an apartment or before starting an institution.
- Faulty Wiring: PUF (polyurethane foam) used for plastic insulation carries a high risk of accidental fire as most of the times it is exposed to electrical wiring which on becoming heated due to overloading or short circuit catches fire immediately.

Measures needed:

- Modernisation of Fire safety equipment: the government should provide financial support and assistance in augmenting and modernising the fire departments
- Proper designing of electrical fittings and regular maintenance of wiring (at least once in a year).
- Building awareness among citizens about fire prevention and protection measures by organising fire fighting workshop once in six months in localities/Mohallas/schools with the involvement of local councillors/elected representatives.
- Fire service departments should audit critical fire prone installations (like high rise buildings, multiplexes in congested areas) periodically (once in six months) and take appropriate actions against erring establishments.
- Proper demarcation of entry and exit points in crowded buildings, installation of fire fighting equipment and their regular maintenance, periodic renewal of No-objection certificates by building owners in order to ensure fire preparedness.

Way forward:

- Fire service is a state subject and has been included as municipal function in the XII schedule of the Constitution. The municipal corporations and local bodies are responsible for providing fire services in many states.
- All State governments should require mandatory compliance with such safety features for any institution handling patients or giving care.
- Certification of facilities through third-party audit should be made compulsory to eliminate conflicts of interest involving official agencies.
- The institutions should also be insured for the highest levels of public liability.
- At a broader level, governments must shed their indifference and work to make all spaces safe.
- In private, public or commercial buildings, official agencies tend to favour tokenism rather than high standards for the safety of occupants and visitors.
- They are ever-willing to “regularise” deviations in construction over time. It is time to fix responsibility for deadly accidents on a single official agency.

TOPIC: Linkages between development and spread of extremism; Role of external state and non-state actors in creating challenges to internal security.

Q) What do you understand by online extremism ? Discuss the relevance of ‘Christchurch call to action’ recently seen in news to combat the same. (250 words)

Reference

Why this question:

India recently joined the global initiative to combat extremism online

The initiative ‘Christchurch call to action’ has been named after the New Zealand city where 51 people were killed in an attack on mosques.

Key demand of the question:

The answer must first address the concept of online extremism and then discuss broadly the genesis, objectives and significance of ‘Christchurch call to action’.

**Directive word:**

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines discuss the relevance of the question. State recent terror attacks that took form of online extremism.

Body:

- Define online extremism – Online Extremism can be defined as advocating support of groups or causes that in any distribution of opinion would lie on one of the “tails”.
- The primary goal is to create online social network of unaffiliated sympathizers, propagandists, fighters and recruiters to create a thriving online extremist community (OEC).
- Then move on to discuss the genesis and objectives of the ‘Christchurch call to action’ – the initiative outlines collective, voluntary commitments from governments and online service providers intended to address the issue of terrorist and violent extremist content online and to prevent the abuse of the internet.
- The Christchurch attack highlighted the urgent need for action and enhanced cooperation among the wide range of actors with influence over this issue, including governments, civil society, and online service providers, such as social media companies, to eliminate terrorist and violent extremist content online.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- Online Extremism can be defined as advocating support of groups or causes that in any distribution of opinion would lie on one of the “tails”. The primary goal is to create online social network of unaffiliated sympathizers, propagandists, fighters and recruiters to create a thriving online extremist community (OEC).
- India has joined a major global initiative to combat terrorism and extremism online and secure the internet. The initiative, ‘**Christchurch call to action**’, has been named after the New Zealand city where 51 people were killed in an attack on mosques.

Body:**Genesis of ‘Christchurch call to action’:**

- The Christchurch attack highlighted the urgent need for action and enhanced cooperation among the wide range of actors with influence over this issue, including governments, civil society, and online service providers, such as social media companies, to eliminate terrorist and violent extremist content online.
- The gathering in Paris has been organized by France and New Zealand. Amazon, Facebook, Google, Microsoft and Twitter also signed on to the document, pledging to work more closely with one another and governments to make sure that their sites do not become conduits for terrorism.

Highlights of Declaration:

- The initiative outlines collective, voluntary commitments from governments and online service providers intended to address the issue of terrorist and violent extremist content online and to prevent the abuse of the internet.
- All action on this issue must be consistent with principles of a free, open and secure internet, without compromising human rights and fundamental freedoms, including freedom of expression.
- It also recognises the internet’s ability to act as a force for good, including by promoting innovation, economic development and fostering inclusive societies.
- It encourages media outlets to apply ethical standards when depicting terrorist events online.
- Avoid amplifying terrorist and violent extremist content, with responsible coverage of terrorism and violent extremism.
- It was also decided to implement immediate and effective measures to mitigate the specific risk that terrorist and violent extremist content is disseminated through live-streaming, including identification of content for real-time review.

The documents draw in the online service providers to commit to:

- Take transparent, specific measures seeking to prevent the upload of terrorist and violent extremist content and to prevent its dissemination on social media and similar content-sharing services.
- Provide greater transparency in the setting of community standards or terms of service, including by:
- Outlining and publishing the consequences of sharing terrorist and violent extremist content;
- Describing policies and putting in place procedures for detecting and removing terrorist and violent extremist content.

Conclusion:

- The reach of internet and social media has had both positives and negatives. The Christchurch call looks into dealing with making internet more user friendly and eliminate the violent extremism from proliferating by global cooperation.

Q) What is the central ideology of Maoist insurgents in India ? Critically analyse also suggest solutions to address the issues associated. (250 words)

Reference

Why this question:

The question is in the backdrop of recent attacks witnessed in Arunachal Pradesh where Tirong Aboh, the sitting MLA from Khonsa West assembly constituency, along with 10 others have been killed in an ambush by unidentified gunmen in Tirap District

Demand of the question:

The answer must explain how the decades-old insurgency is a major internal threat facing the world's largest democracy and one must narrate in detail the central ideology of such Insurgency.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Known in India as the Naxalites or Naxals, the Maoists are considered to be left-wing extremists who broke away from mainstream communism on ideological issues like the decision by the main parties to join the electoral process.

Body:

Body of the answer should capture:

- What is their central idea ?
- When was the movement formed?
- Who do the Naxalites represent?
- What attracts the population to the movement?
- Who is their target?
- What steps has the government taken so far to fight the Naxalites?
- What measures are required still to curb the menace of Maoism.
- Discuss some specific case studies – North East region to justify better.

Conclusion:

Conclude with what should be the way ahead.

Introduction:

- The Naxalite–Maoist insurgency is an ongoing conflict between Maoist groups known as Naxalites or Naxals and the Indian government. Maoism is a form of communism developed by Mao Tse Tung. It is a doctrine to capture State power through a combination of armed insurgency, mass mobilization and strategic alliances. Since its inception at Telangana in the 1930s, the insurgent movement has become one of the major threats to the democratic structure of the Indian nation.
- Recently, Tirong Aboh, the sitting MLA from Khonsa West assembly constituency, along with 10 others were killed in an ambush by unidentified Maoist gunmen in Tirap District.

**Body:**

The central theme of Maoist ideology:

- The central theme of Maoist ideology is the use of violence and armed insurrection as a means to capture State power.
- 'Bearing of arms is non-negotiable' as per the Maoist insurgency doctrine.
- The Maoist ideology glorifies violence and the 'Peoples Liberation Guerrilla Army' (PLGA) cadres are trained specifically in the worst forms of violence to evoke terror among the population under their domination.
- However, they also use the subterfuge of mobilizing people over issues of purported inadequacies of the existing system, so that they can be indoctrinated to take recourse to violence as the only means of redressal.
- The Maoists also use propaganda and disinformation against State institutions as other components of their insurgency doctrine.

Spread:

- The States of Chhattisgarh, Jharkhand, Orissa and Bihar are considered severely affected. The States of West Bengal, Maharashtra and Andhra Pradesh are considered partially affected. The States of UP and MP are considered slightly affected. Together, the affected area is called 'Red Corridor'.
- Strategy: The Maoists wish to keep the population in their strongholds cut-off from the mainstream milieu. The schools are attacked because education promotes a spirit of enquiry among the local population and also equips children with skills for alternative sources of livelihood. These developments are looked upon by the Maoists as potential threats to their very existence and their outdated ideology. The Maoists also destroy infrastructure like roads and telecom network to keep populations isolated from mainstream India.

Government's current measures:

- After identifying the Naxalites as the most serious threat to the Indian state, the central government has set up a special 10,000-strong Combat Battalion for Resolute Action (Cobra) to fight them.
- The government of India's **National Policy and Action Plan**, with its emphasis on security and development, is making an impact. Under this plan, as many as 307 fortified police stations were constructed in Naxal-hit areas in last three years.
- Besides, 1,391 km roads were constructed in some of the most difficult areas under the road requirement plan phase-I. Additional roads were approved for construction in nine Naxal-hit areas as well
- The reduction in Naxalite activity is mainly attributable to Operation Green Hunt, which was launched in 2009 and is undertaken jointly by the security forces of the central and state governments to eliminate Naxalites.
- Operation 'SAMADHAN' stands for Smart leadership, Aggressive strategy, Motivation and training, Actionable intelligence, Dashboard Based KPIs (key performance indicators) and KRAs (key result areas), Harnessing technology, Action plan for each theatre, and No access to financing.
- The MHA has suggested the use of trackers for weapons, and bio-metrics in smart guns.
- Unique Identification number (UID) for Gelatine sticks and explosives.
- At least one UAV or Mini UAV for each of the Central Armed Police Forces (CAPF) battalions deployed in the Maoist hotbed.
- More helicopter support for operations. Helicopters to be used to rush in supplies and reinforcement. Increased number of flying hours.
- Joint Task Forces for operations along inter-State boundaries to be set up. Better inter-state coordination and intelligence sharing.
- 400 fortified police stations to be set up in Naxal belt.
- Resumption of Left Wing Extremism (LWE) – specific schemes such as SRE, SIS, IAP/ACA, CIAT schools.
- Prevention of Money Laundering Act (PMLA) to be reviewed to ensure effective choking of fund flow to LWE groups.
- Fast tracking building infrastructure, with a focus on solar lights, mobile towers with 3G connectivity, and road-rail connectivity.
- Indian Army or specialized forces – such as Greyhounds – to train forces to take on Naxals.
- Forces should be more proactive and aggressive in owning operations, rather than being reactive.
- Apart from the construction of roads, mobile towers, setting up of banks, post offices, Kendriya Vidyalayas, etc, the most significant achievement has been in poverty reduction. A recent study published in a Brookings blog says that by 2022, less than 3 per cent of Indians will be poor and that extreme poverty could be eliminated altogether by 2030.

- Choking the financial funding of Naxals forms the foundation of the new strategy. Evidence shows that demonetisation curbed naxal funding
- The security-related expenditure (SRE) scheme, special infrastructure scheme (SIS), integrated action plan (IAP) and a few other schemes will be extended for a few more years if the finance ministry's approval is received.

Approach which India can follow in future:

- One of such promising avenues can be bringing the rebels to the negotiation table by creating a holistic process of disarming the rebels, integrating them into society, and ensuring that the socio-economic conditions are improved.
- International experience: The Colombia peace deal can provide a skeleton for developing such an approach. The Colombia peace process was signed between the Colombian government and the Revolutionary Armed Forces of Colombia-People's Army (FARC-EP), which ended the approximately five-decade-old civil war
- Comprehensive rural reforms would be a positive step toward addressing the socioeconomic issues behind Naxalism.
- Comprehensive rural reform for India would include land access and use reform such as proper implementation of Schedule 5 and 9, a special rural land legal system to resolve land conflicts between government officials and tribals, and improving laws for equitable access to forest produce
- There is a need to empower local governments giving adequate powers to Gram Sabha and building confidence in the people of government's developmental agenda

Conclusion:

- It is imperative that government instead of being reactionary goes after them proactively. But it has herculean challenge of doing it in democratic way. It is obvious that there is and should be two pronged approach to counter it, one at ideological level and other at physical level. In former case, good governance by government and delivering good results in fields of Education, Health and overall standard of living will be instrumental.

Topic: Security challenges and their management in border areas.

Q) Evaluate the major shortcomings in India's national security architecture. Suggest measures to overcome these shortcomings with respect to the key recommendations made by D.S. Hooda's document. (250 words)

The hindu

Why this question:

The article highlights the urgent need for a blueprint for national security strategy for India.

Key demand of the question:

The answer must discuss in detail the major shortcoming of National security in India. What measures can be taken to address these issues highlighting the need for a road map designing the national security agenda.

Directive word:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer

Introduction:

write a few introductory lines on the importance of national security.

Body:

Answer should have the following dimensions covered:

- Discuss the need for formulating a national security strategy for India.
- What are the major shortcomings in India's national security architecture that must be addressed?
- key national security institutions and revamp their functioning.
- Role of National Security Adviser with respect to accountability and legal formality.
- Significant features of Hooda document.
- Way forward.

Conclusion –

Conclude with significance and what should be the way forward.

MISSING THE BIG PICTURE

India is struggling with the lack of a roadmap, planning expertise and major defence reform

1) National Security Strategy (NSS)

Status: Yet to be completed, though the government is believed to be working on a draft NSS

2) Chief of Defence Staff

Status: Not appointed despite recommendation by a GoM in 2001 and the Shekatkar committee in 2016

3) Integrating the armed forces into

theatre commands

Status: Shekatkar committee recommended creating three integrated commands to replace the existing 17 separate commands. Yet to be implemented

4) Defence planning to harmonise budgets, spending, priorities

Status: A defence planning committee was set up under NSA

Ajit Doval on April 18. A permanent body, it includes defence and foreign secretaries, three service chiefs

5) Reducing wastage, redeployment of personnel

Status: The government is redeploying 57,000 personnel as per the Shekatkar Committee directive. To be completed by December 2019

Introduction:

- A National Security Strategy or Policy (NSS or NSP) is a key framework for a country to meet the basic needs and security concerns of citizens, and address external and internal threats to the country. It is pertinent to ask, even today, whether India thinks about strategic affairs in a systematic, consistent and coherent manner or whether its national security runs on ad hoc arrangements and 'raw wisdom'. Human security involves basing the understanding of security on the needs of citizens, not just those of the government/State.

Body:

The **major shortcomings** in India's national security architecture are:

- The National Security Council (NSC) set up in 1998 almost never meets, primarily because it is an advisory body, with the Cabinet Committee on Security being the executive body.
- If the NSC is to be made more useful, the government's allocation of business rules should be amended to give more powers to the NSC and its subordinate organisations, such as the Strategic Policy Group.
- Even though the National Security Adviser (NSA) plays a vital role in national security, he has no legal powers as per the government's allocation of business rules.
- The C. Pant Task Force in the late 1990s had recommended the creation of an NSA with the rank of a Cabinet Minister.
- Over the years, the NSA's powers have increased, even though he is not accountable to Parliament. The institution of the NSA today requires more accountability and legal formality.
- India spends close to \$50 billion annually on defence and yet there are serious concerns about the level of our defence preparedness. India might be ill-equipped to fight the wars of the modern age
- There is a little conversation between the armed forces and the political class, and even lesser conversation among the various arms of the forces
- One of the most serious lacunas in our defence management is the absence of jointness in the Indian armed forces.

- Our doctrines, command structures, force deployments and defence acquisition continue as though each arm is going to fight a future war on its own.

Key recommendations made by D.S. Hooda to overcome these shortcomings:

- Hooda's National security strategy document defines security in an out-of-the box and inclusive manner. The document summarises the reforms under 5 heads:
 - Assuming our rightful place in global affairs.
 - achieving a secure neighbourhood
 - peaceful resolution of internal conflicts
 - protecting our people
 - strengthening our capabilities
- On the issue of military jointmanship, it recommends that "the three services should undertake a comprehensive review of their current and future force structures to transform the army, navy and air force into an integrated warfighting force."
- It argues that it would take "a cultural change in the way the DRDO is currently operating" to improve domestic defence production.
- On the Kashmir question too, the document seems to differ with the incumbent government's muscular policy, and General Hooda's words should be a wakeup call for everyone: Killing terrorists is an integral part of military operations to ensure that the state does not descend into chaos.
- While discussing emerging national security threats, the document differs with the present government's decision to set up a Defence Cyber Agency instead of a Cyber Command as was originally recommended.

Conclusion:

- Serious efforts are required for countering radicalisation. There is a need to initiate structured programmes that bring together civil society members, family groups, educationists, religious teachers and even surrendered terrorists in an effort to roll back radicalisation.
- There is an urgent need for thinking about national security and strategy more systematically, consistently and comprehensively.

Topic: Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

Q) Cyber-frauds have grown in terms of sophistication and reach in the recent times with increasing influence of social media. Critically analyse. (250 words)

Livemint

Why this question:

The article brings us highlights of a report- Current State of Cybercrime – 2019" white paper, released by RSA Security, that states cyber criminals are increasingly relying on social media platforms to sell stolen identities, credit card numbers and other ill-gotten gains. Fraud from mobile apps rose 680% between 2015 and 2018.

Key demand of the question:

Analyse in detail the issues around cyber security, the root causes of Cyber fraud and what needs to be done to handle the menace.

Directive word:

Critically analyse – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In a few introductory lines discuss the highlights of the report.

Body:

- First explain what you understand by cyber frauds – cyber fraud is any crime that is committed with the use of a computer or to computer data. This can look like many things, such as: Identity theft. Stolen bank account numbers.

- Due to the incredibly rapid advances in technology and electronic communications, a steadily increasing proportion of total fraud is being perpetrated with the use of computers, the Internet, and sophisticated software and programming techniques.
- Discuss the impact, reach and expanse – not only are individuals victimized by cyber fraud, but companies suffer from the costly effects of cyber fraud within their networks.
- Explain while some of the detection and prevention methods for managing these cyber risks will be technological, a human element in the fight against cyber fraud will always be central to the war on such crimes.
- explain with the aid of recent examples.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- The “Current State of Cybercrime – 2019” white paper, released by RSA Security says that cyber criminals are increasingly relying on social media platforms to sell stolen identities, credit card numbers and other ill-gotten gains. Fraud from mobile apps rose 680% between 2015 and 2018, says the study.

Body:

- Cyberfraud refers to any type of deliberate deception for unfair or unlawful gain that occurs online. The most common form is online credit card theft. Other common forms of monetary cyberfraud include non-delivery of paid products purchased through online auctions and non-delivery of merchandise or software bought online. Cyberfraud also refers to hacking, phishing, cyber-stalking, data break-ins, identity theft and cyber-bullying, all of which are seriously damaging.

Reasons for increasing cyber-frauds:

- Hardware Cyber Security Concerns: Most equipment and technology for setting up Cyber Security infrastructure in India are currently procured from global sources. These systems are vulnerable to cyber threats just like any other connected system.
- Skill gaps: Globally, India ranks second in terms of the number of Internet users after China (Internet World Stats, 2017). However, India has a negligible base of cyber security specialists, when compared to internet user base.
- Internet of Things as a weak link: Often internet connected devices lack basic security features, or they aren't properly configured and rely upon default passwords that can give attackers easy access. This in turn is giving rise to botnets, which can be used for volumetric attacks.
- Digital Data Threat: Growing online transactions have generated bigger incentives for cybercriminals. Besides, establishments looking to mine data (customer information, results of product surveys, and generic market information), they also create treasured intellectual property that is in itself an attractive target.
- Lack of robust Legal and law enforcement mechanisms: India's approach to cyber security has so far been ad hoc and unsystematic. Despite a number of agencies, policies and initiatives, their implementation have been far from satisfactory.
- Lack of Coordination between stakeholders: Due to the existence of too many agencies with overlapping functions in the field of cyber security, coordination between these agencies is poor
- Lack of awareness: There is a lack of awareness about cyber security threats and preventive measures at both organizational level as well as individual level.

CYBERATTACKS IN INDIA OF LATE

July 2016

UNION BANK OF INDIA HEIST

Through a phishing email sent to an employee, hackers accessed the credentials to execute a fund transfer, swindling Union Bank of India of \$171 million. Prompt action helped the bank recover almost the entire money

May 2017

WANNACRY RANSOMWARE

The global ransomware attack took its toll in India with several thousand computers getting locked down by ransom-seeking hackers. The attack also impacted systems belonging to the Andhra Pradesh police and state utilities of West Bengal

May 2017

DATA THEFT AT ZOMATO

The food tech company discovered that data, including names, email IDs and hashed passwords, of 17 million users was stolen by an 'ethical' hacker—who demanded the company must acknowledge its security vulnerabilities—and put up for sale on the Dark Web

June 2017

PETYA RANSOMWARE

The ransomware attack made its impact felt across the world, including India, where container handling functions at a terminal operated by the Danish firm AP Moller-Maersk at Mumbai's Jawaharlal Nehru Port Trust got affected

Importance of cyber security in India:

- Cyber security is an important arena of internet when the country is moving forward towards a cashless society and digitization.
- Till 2013, India did not even have a cyber security policy in place. It is of paramount concern to take cyber security seriously in India with most of the transactions going online and cashless.
- Security becomes a challenge as now privacy is a fundamental right as per SC verdict and the rise in cybercrimes can lead to violation of private space and liberty of expression.
- Cyber security becomes a vital law of cyber law today. There is need of new tools; capacity building must be done in various departments and a mechanism in place to address these challenges.
- The Indian government has embarked on a programme to turn the country into a digital economy. It has unveiled a series of initiatives—from introducing Aadhaar, MyGov, Government e-Market, DigiLocker, Bharat Net, Startup India, Skill India and Smart Cities to propel India towards technological competence and transformation.

Way forward:

- **Technology:**
 - It is important to define minimum security features for the hardware and software to be deployed in the government ecosystem
 - There is an urgent need to build capabilities and capacity for application, equipment and infrastructure testing through the deployment life cycle to detect any vulnerability and backdoors in the product/technology.
 - Security Operations Centre should be developed for the government organizations with capabilities to detect, respond and recover from any breaches and attacks
- **Human resource:** Immediate attention has to be given to human resource development which would increase the number of experts who can effectively manage the cyber security of the country
- **R&D:** Investments should be made on R&D to develop more innovative technologies to address increasing cyber security threats
- **Policy and Governance:** It is important to bring a robust policy and effectively implement the same. Further, duties and responsibilities should be defined clearly for smooth functioning and better coordination among departments and stakeholders
- **Strengthening Private Partnership:** It is important to strengthen the public- private partnership on cyber security.

Conclusion:

- Most of the Indian banking industry and financial institutions have embraced IT to its full optimization. Reports suggest that cyber-attacks are understandably directed toward economic and financial institutions. With innovative, technology led programmes such as AADHAAR, MyGov, GeM, Digital Locker the new India is the land of technological prowess and transformation. Government and the private sector jointly have to give cyber security some priority in their security and risk management plan.
- Cyber awareness must be spread and there should be multi-stakeholder approach- technological inputs, legal inputs, strengthening law enforcements, systems and then dealing with transborder crime involves lot of international cooperation.

Q) What is cyber-crime ? What types of cyber security threats are being witnessed by the world today ? Explain India's attempts to tackle these issues. (250 words)

Reference

Why this question:

The paper covers in detail the concept of Cyber security, its types and the steps India is taking in this direction.

Key demand of the question:

Answer must discuss the concept of cyber-crime, issues posed by it and the efforts by India to tackle such issues.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines highlight what you understand by cyber-crime.

Body:

In brief discuss the following aspects:

- What do you mean cyber-crime?
- three major categories of cyber-crimes? – Crimes Against People, Crimes Against government, crime against property.
- How is cybercrime committed?
- What are cyber laws in India?
- Discuss significance of policies and laws in this direction like the IT Act etc.

Conclusion:

Conclude with way forward.

Introduction:

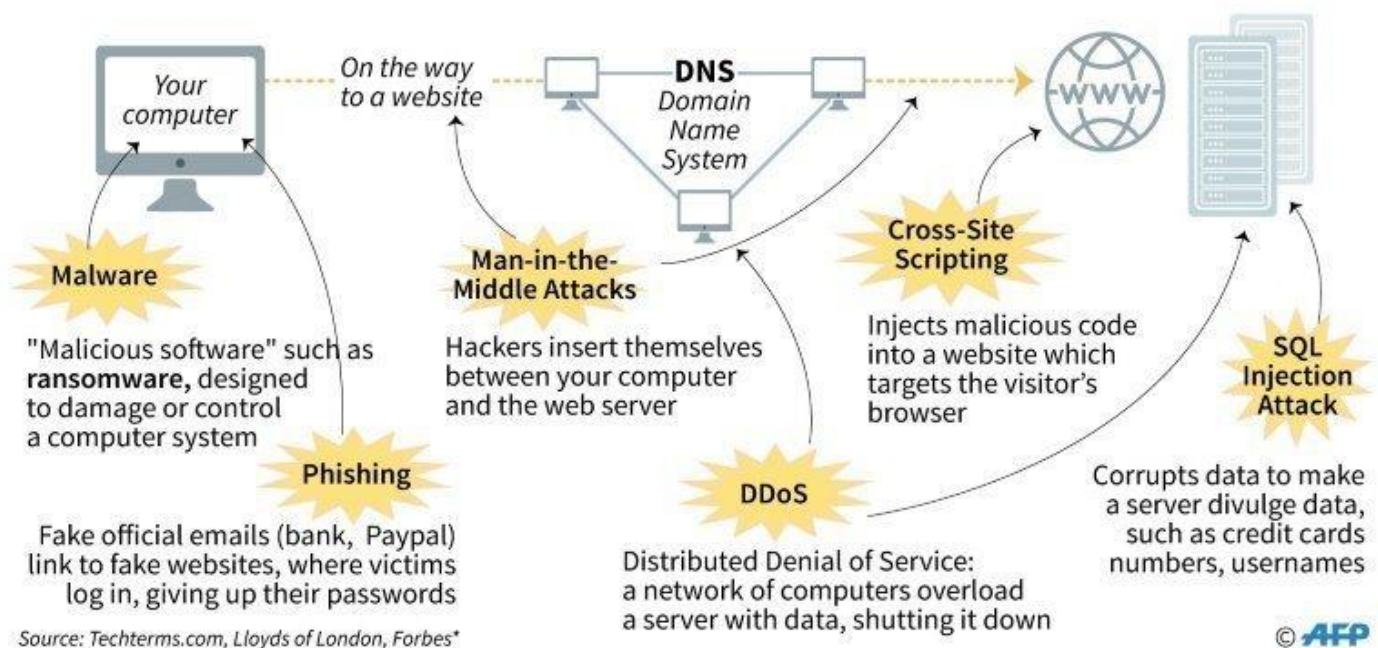

- Cybercrime is a criminal action that encompasses mobile phones, laptop, network, and computer. It is a threat to country's external and internal security and monetary status.
- Crimes committed against publics with an illicit intention to cause physical or psychological harm, or loss to the victim directly or indirectly, by means of contemporary telecommunication networks such as social media network, the Internet and mobile phones.

Body:

- **Types of cyber security threats:** **Cyber Security** is protecting cyber space including critical information infrastructure from attack, damage, misuse and economic espionage.

The different types of cyber attacks

Cyber crime worldwide cost \$400 billion in 2015 and is forecast to reach \$2 trillion in 2019*

India's attempts to tackle these issues:

Information Technology Act, 2000

- The act regulates use of computers, computer systems, computer networks and also data and information in electronic format.
- The act lists down among other things, following as offences:
- Tampering with computer source documents.
- Hacking with computer system
- Act of cyber terrorism i.e. accessing a protected system with the intention of threatening the unity, integrity, sovereignty or security of country.
- Cheating using computer resource etc.

Strategies under National Cyber Policy, 2013

- Creating a secure cyber ecosystem.
- Creating mechanisms for security threats and responses to the same through national systems and processes.
- National Computer Emergency Response Team (CERT-in) functions as the nodal agency for coordination of all cyber security efforts, emergency responses, and crisis management.
- Securing e-governance by implementing global best practices, and wider use of Public Key Infrastructure.
- Protection and resilience of critical information infrastructure with the National Critical Information Infrastructure Protection Centre (NCIIPC) operating as the nodal agency.
- NCIIPC has been created under Information Technology Act, 2000 to secure India's critical information infrastructure. It is based in New Delhi.
- Promoting cutting edge research and development of cyber security technology.
- Human Resource Development through education and training programs to build capacity.

Cyber Surakshit Bharat Initiative: It was launched in 2018 with an aim to spread awareness about cybercrime and building capacity for safety measures for Chief Information Security Officers (CISOs) and frontline IT staff across all government departments.

National Cyber security Coordination Centre (NCCC): In 2017, the NCCC was developed. Its mandate is to scan internet traffic and communication metadata (which are little snippets of information hidden inside each communication) coming into the country to detect real-time cyber threats.

Cyber Swachhta Kendra: In 2017, this platform was introduced for internet users to clean their computers and devices by wiping out viruses and malware.

Training of 1.14 Lakh persons through 52 institutions under the Information Security Education and Awareness Project (ISEA) – a project to raise awareness and to provide research, education and training in the field of Information Security.

International cooperation: Looking forward to becoming a secure cyber ecosystem, India has joined hands with several developed countries like the United States, Singapore, Japan, etc. These agreements will help India to challenge even more sophisticated cyber threats.

Way forward:

- Real-time intelligence is required for preventing and containing cyber attacks.
- Periodical 'Backup of Data' is a solution to ransomware.
- Using Artificial Intelligence (AI) for predicting and accurately identifying attacks.
- Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
- Increased awareness about cyber threats for which digital literacy is required first.
- India needs to secure its computing environment and IoT with current tools, patches, updates and best known methods in a timely manner.
- The need of the hour for Indian government is to develop core skills in cyber security, data integrity and data security fields while also setting stringent cyber security standards to protect banks and financial institutions.

Topic: Role of external state and non-state actors in creating challenges to internal security. Linkages of organized crime with terrorism.

Q) Do you agree that Asia, not West Asia is turning into a host to multiple “terrorist safe havens,” owing to the rise of mass radical movements and years of complacency on the part of policymakers. Elucidate with recent examples. (250 words)

Livemint

Why this question:

The article provides for a detailed analysis of how the recent gruesome Sri Lankan bombings are a reminder that Asia—not West Asia—is the region most afflicted by terrorist violence. Home to the vast majority of the world's Muslims, it is also host to multiple “terrorist safe havens,” owing to the rise of grassroots radical movements and years of complacency on the part of policymakers.

Key demand of the question:

Analyse in detail the causes of rise in terrorist safe havens in Asia apart from regular incidences of West Asia. One has to bring out recent examples and justify along with suggesting measures of what needs to be done.

Directive word:

Elucidate – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Provide for the context of recent bombings in Sri-Lanka.

Body:

Discuss the following aspects in the answer body –

- What are the causes for this shift of terrorist havens from west Asia to other parts of Asia? – rise of grassroots radical movements, lack of effective policies, failures etc.
- Quote examples – massacre by a white supremacist at two mosques in Christchurch, New Zealand, 2008 Mumbai attacks, the recent Pulwama attack etc.
- Discuss what needs to be done to resolve the situation and bring it back in control?
- Discuss the policies and initiatives needed by the governments in this direction, need for collaborative efforts etc.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- The murder of more than 250 churchgoers, tourists, and other civilians in Sri Lanka on Easter Sunday should serve as a reminder that Asia is now the world's leading site of Islamist extremism.
- Radical Islamic groups, some affiliated with larger extremist networks, have been quietly gaining influence in an arc of countries extending from the Maldivian to the Philippine archipelagos, and the threat they pose can no longer be ignored.

Body:

The causes for this shift of terrorist havens from west Asia to other parts of Asia:

- **Poor Socio-Economic conditions:**
 - High incidences of poverty, rising inequality, lack of opportunities for the educated youth has made the people soft targets to radicalization and extremist ideologies.
 - The rising radicalism among the people has also added to the vulnerability.
- **Communalism:**
 - The Imperialist sown seeds of Communalism are still strong and the differences between the majoritarians and minorities are manifested in violence. Terror easily finds a space in such turmoils.
 - Official discrimination against Muslims has contributed to Islamists' growing influence, particularly in Myanmar's Rakhine state, Thailand's four southernmost provinces, and the southern Philippine island of Mindanao.
- **Complacency on the part of policymakers:**
 - Asia and in particular South Asia is one of the least integrated regions of the world exposing the rifts which the terrorists can easily cash in on.
 - The rugged terrains, disconnect between the countries due to political differences have led to poor check on security arrangements.
- **State Sponsored Terrorism:**
 - Increased sponsoring of the terror outfits by Pakistan, China and Bangladesh to promote their political agenda has become a serious challenge.
- **Links with the West Asia:**
 - Wahhabism, the austere, rigid version of Islam bankrolled by Saudi Arabia and other Gulf sheikhdoms, remains the driving force behind Islamist terrorism today.
 - Its offspring include not just Al Qaeda and IS, but also the Taliban in Afghanistan, Lashkar-e-Taiba in Pakistan, Boko Haram in Nigeria, and al-Shabaab in Somalia. All of these groups are driven by a nihilistic rage born of hostility toward non-Sunnis and a rejection of modernity.

- The battle-hardened fighters of ISIS from Iraq and Syria with the operational training to stage savage attacks are now returning home. Returnees are present in many other Asian countries as well, from the Philippines and Indonesia to the Maldives and Uzbekistan.

Measures needed:

- Socio-economic factors leading to poverty and alienation must be targeted with national and local level policies.
- Defunct organizations like SAARC should be revived to build the inter-regional co-operation, which would help in regional growth.
- The regional groupings should improve their strategy to fight against terrorism like the RATS of SCO.
- Intelligence sharing with exchange of critical information about terror and extremists should be made part of bilateral agreements and be shared actively.
- Religious leaders and returnees from terror camps should be used to preach and sensitize youth with radical thoughts.
- Monitoring of Social media, curbing of fake news and rumours should also be a part of the strategy to fight terror.

Conclusion:

- As the late Singaporean leader Lee Kuan Yew said, preventing terrorist attacks requires that we eliminate the “queen bees” (the preachers of hatred and violence) who are inspiring the “worker bees” (suicide bombers) to become martyrs.
- The global war on terror, launched by the United States after the attacks of 11 September 2001 is losing steam. Unless it is invigorated and prosecuted to the end, many more innocent lives will be lost.

Q) The recent attacks in Sri Lanka underline the many shortcomings in the concept of a global War on Terror. Elucidate. (250 words)

The hindu

Why this question:

The article highlights how the recent brutal attacks on Easter Sunday in Sri Lanka, for which the Islamic State (IS) claimed responsibility, have reignited discussion on the global ‘War on Terror’.

Key demand of the question:

The answer must evaluate the global efforts for war on terror. The question aims to bring out the shortcoming of such an effort that is leading to continued incidences of such terror attacks across the globe.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In a few introductory lines narrate the background – highlight the recent incidence of terror attack in Sri Lanka.

Body:

The answer must elucidate upon what is Global War on Terrorism?

What are its shortcomings? Why is it failing to address the issue of terrorism? – discuss the issue of religious terrorism, use the case study of recent terror attack that Sri Lanka witnessed. Discuss how global efforts have failed to address the issue. Suggest what needs to be done to overcome the issue and address the menace of global terrorism.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- The brutal attacks on Easter Sunday in Sri Lanka, for which the Islamic State (IS) claimed responsibility, have reignited discussion on the global ‘War on Terror’. The increase in attacks and deaths across more countries has meant that the impact of terrorism is becoming more widespread, even as deaths from terrorism are decreasing. As the intensity of terrorism has increased over the last two decades, its impact has also spread to more countries around the world.

**Body:****Global War on Terrorism:**

- The War on Terror first began on a global scale after the 9/11 terrorist attack in 2001.
- The first global mission for War on Terror was Operation. Enduring Freedom by 60 countries led by US to replace Taliban government in Afghanistan and defeat Al-Qaida.
- However, it appears that this first global mission has produced limited positive results. US now intends to withdraw from Afghan & is in talks with Taliban to ensure its representation in Afghan government even though Taliban still continues terrorist attacks in Afghan.
- Therefore, the objective of Operation. Enduring Freedom to replace Taliban & to end Talibani terrorism has failed.
- The second War on Terror was when 46 nations led by US formed the 'Coalition of the Willing' in 2003 to defeat Saddam Hussein in Iraq.
- However, it led to the destabilization of Iraq & formation of global terrorist State- ISIS, which is now undertaking terrorist attacks on global scale such as in Sri Lanka. Therefore, the second War on Terror ended by increasing global terrorism.
- The Next War on Terror was conducted in Libya & Syria after the Arab Spring in 2011.
- Libya did not have strong linkages with spread of terrorism but a Coalition of Western countries led by France undertook regime change in Libya & it became destabilized, which now has become a safe haven for Al-Qaeda. Similarly, destabilized Syria became a safe haven for ISIS & other terrorist groups.
- Therefore, the next War on Terror in Libya & Syria led to formation of terrorist groups & safe havens which did not exist earlier.

Shortcomings of the effort:

- There was no change in the five countries most impacted by terrorism, which include Iraq, Afghanistan, Nigeria, Syria and Pakistan. All of these countries have been ranked in the worst five every year since 2013.
- Conflict continued to be the primary driver of terrorist activity for the countries most impacted by terrorism in 2017.
- In 2017, terrorist attacks in conflict countries averaged 2.4 deaths, compared to 0.84 deaths in non-conflict countries. Terrorist attacks are more lethal on average in countries with a greater intensity of conflict. In 2017, countries in a state of war averaged 2.97 deaths per attack, compared to 1.36 in countries involved in a minor armed conflict.
- There are numerous possible reasons for this difference. Countries in conflict have a greater availability of more military-grade small arms and bomb-making capabilities.
- Countries that are not in conflict tend to be more economically-developed and spend more on intelligence gathering, policing and counterterrorism.
- The War on Terror built by world leaders is a "fight for Islam" is equally false. According to the Global Terrorism Database, of the 81 terror attacks in which more than 100 were killed (high casualty) since 2001, more than 70 were carried out in Islamic or Muslim-majority countries.

Conclusion:

- The world community must address contradictions in the War on Terror. For 20 years, the world has failed to agree on a common definition of terrorism at the United Nations. Unless the world is truly united on the issue and resolves such contradictions, the global War on Terror will only be as strong as its weakest link.
- The success or failure of each of these approaches must be studied before deciding their applicability elsewhere. A **comprehensive and multidimensional strategy** for the "War on Terror" must involve an integrated view of these strategic military and economic domains, among others.

Topic: Role of media and social networking sites

Q) Discuss the effects of social media on Democracy. How does it play a key role to be an enabler of transparency and democracy? (250 words)

Reference**Why this question:**

The article discusses in detail how social media influence democracy.

Key demand of the question:

The answer must debate that there are several positives that social media brings to the table, including affordable access to information, voicing voter concerns, and adding another communication channel

between voters and politicians. But social media has just as many pitfalls — some that are already being addressed, others that both social media companies and governments continue to examine. Thus, for users of social platforms, it is becoming increasingly important to be aware of these pitfalls.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines explain the role of social media in general.

Body:

- Highlight why social media is important to a democracy?
- How does media strengthen democracy?
- What is the relationship between media and democracy in general? Discuss the specific case of social media.
- What are the issues associated?
- Explain how can one handle these issues, explain what needs to be done.

Conclusion:

Conclude with what should be the way forward.

Introduction:

- Democracy provides opportunities to enhance the role of people in collective decision-making so that it is inclusive, equitable, transparent, accountable and justiciable. In this respect, social media has had a significant contribution towards making democracy even stronger than before.
- It started with the electronic media becoming its fourth pillar in 2000s and culminated with the growing role of internet in the form of social media. After legislature, executive, Judiciary, Media and Common Man, the sixth pillar of the democracy is touted to be 'Social Media'. All these pillars have the capacity to change the status-quo and undone wrongdoing.

Body:

- The social media is a recent additive. It works on a virtual space almost without any constraint. The main platforms are Facebook, whatsapp and Twitter. The capacity of online activism through these platform is immense.
- Social media has drastically changed the landscape in democratic polity in following ways:

Public's outreach to Government:

- Greater mass involvement in decision-making, providing input to policies, sharing of ideas and innovative governance methods
- Faster complaint registration and grievance redressal;
- Time and resource management with online execution of most formalities
- In Iceland, for example, when someone moves to a new neighbourhood, the first thing they often do is join their community's Facebook group. They tag their representatives in posts and push for the issues they want taken to Parliament. Conversations like these are quietly reinvigorating local governance around the world.

Government's outreach to the public:

- Timely delivery of services: For eg, twitter has been a tool for the passenger of railways to redress their specific grievances.
- Spreading awareness on its policies and schemes using facebook and twitter. Most political leaders, in government or opposition employ social media to interact with people.
- Gauging public mood and response on its recent initiatives so as to modify it accordingly. It thus provides a platform to address the elitism that has crept in politics due to dislink with the public.

Public's outreach to public:

- Act as vanguard of democracy: It is a tool of mobilisation so that protests against unfair policy decisions of govt or against any undemocratic and unconstitutional move can be held. Anna Hazare agitation was one such instance.
- It allows to maintain a critical environment that questions on the doings and undoings. Hence it enriches public discourse.

Social media media's impact on democracy is that it amplifies human intent — both good and bad. At its best, it allows us to express ourselves and take action. At its worst, it allows people to spread misinformation and corrode democracy.

Pros:

- The hashtag activism empowers people to speak up injustice without fear. Some recent examples are #not in my name, #MeToo.
- Social media provide solidarity and sense of companionship to those unable to reach government or raise their voice.
- It has long been observed that when people discuss the news, they're more likely to be involved in their community, whether by volunteering or reaching out to elected officials. There is growing evidence that this is also true for social media — especially among young people.
- Social media platforms are driving people not just to learn about issues but to take action. For e.g.: During the 2016 US election alone, the voter registration efforts on Facebook led more than 2 million people to register to vote.

Cons:

- Online abuse, hate speech and harassment is perpetuating with anonymity. Policing the content at a global scale is an open research problem since it is hard for machines to understand the cultural nuances of political intimidation.
- The unbridled exercise of power on online platform is out of government regulation.
- It has become a medium to influence youth by the terror outfits
- The spreading of fake news which hampers peace and tranquillity of a nation is rapid and complete.
- One of the most common criticisms of social media is that it creates echo chambers where people only see viewpoints they agree with — further driving us apart.
- While foreign meddling, misinformation, echo chambers and hate speech get the headlines, it is also worrisome that how social media can distort policymakers' perception of public opinion.
- The 2016 US presidential election brought to the fore the risks of foreign meddling, "fake news" and political polarization. The effect of social media on politics has never been so crucial to examine.
- If politicians mistake the views of a few with the views of many, that can make for bad public policy. Vulnerable populations could end up ignored, and fringe groups could appear mainstream.

Conclusion:

- In short, social media is a potent tool, and may be a revolutionary one, to further strengthen the ethos and principles of democracy in novel ways. The use of social media for political activities influences peoples' political efficacy, political knowledge, and political participation.
- Social media must be submitted to the same rules that are established for other media such as clear accountability and transparency. This would probably require new international laws. Moreover, the big companies should continue looking for ways to prevent the abuse of their media.

GS-III

JUNE **2019**

General Studies Paper - III

Topic: Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

Q) India's unemployment challenge party lies in its success in expanding education while not expanding formal sector jobs. Comment. (250 words)

The hindu

Why this question:

The Article discusses at length the problem of unemployment and in what way one needs to see rising unemployment as a function of rising education and aspirations.

Key demand of the question:

The answer must explain the causes of rising unemployment challenge in India, what are the factors responsible and how it can be resolved.

Directive word:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Begin with brief write up on the current unemployment scenario of the country.

Body:

The answer must discuss the following:

- Quote the facts from the report from the Periodic Labour Force Survey (PLFS).
- Discuss the conditions which suggest that part of India's unemployment challenge lies in its success in expanding education while not expanding formal sector jobs.
- Explain in detail the observations taken together which suggest that the roots of India's present-day unemployment challenges lie in its very success. Educational expansion affects the unemployment debate by skewing the unemployment statistics and by creating greater competition for well-paid jobs among a rising population of educated youth. Rising prosperity allows young graduates to wait for well-paying jobs, creating an army of educated unemployed, before being forced to accept any work, frequently returning to family farms or starting small shops.
- Conclude with way forward.

Conclusion:

Conclude with solutions to overcome the challenge.

Introduction:

- The much talked about report from the Periodic Labour Force Survey (PLFS) is out.
- This was the first time that the NSSO conducted the Periodic Labour Force Survey, which is an annual survey mapping unemployment to provide a closer trace of unemployment.
- The earlier five-yearly surveys used to come with a lag of over one or two years, thus reducing the possibility of timely analysis.

Body:

Key findings in the report:

- The unemployment rate (UR) in both rural and urban India is at its highest since 1972.
- The unemployment rates among men and women in both rural and urban groups, are also the highest ever. The increase in the UR is more than three times among rural men and more than double among rural women according to the usual status since 2011-12
- The staggering increase in the unemployment rate, from 1.7% in 2011-12 to 5.8% in 2017-18 for rural men and from 3.0% to 7.1% for urban men, has generated wide ranging concerns.
- In urban areas, the unemployment rates for females are higher than those for males.
- For 15-19-year-old rural men, the proportion primarily engaged in studying increased from 64% to 72% between 2011-12 and 2017-18. As a result, while the proportion of the population aged 15-19 that is unemployed doubled from 3% to 6.9%, the unemployment rate tripled from 9% to 27%.

- Among social groups, the highest UR is among the 'General' or 'Others' category — 6.7 per cent. This group is followed by Schedule Castes (6.3 per cent), Other Backward Classes (6 per cent) and Scheduled Tribes (4.3 per cent).
- Among religious groups, Christians have the highest UR in both urban and rural areas. In rural areas, Christians have a UR of 7.4 per cent, Muslims have a UR of 6.5 per cent, Sikhs 6.3 per cent and Hindus 5.2 per cent.
- In urban areas, Christians have a UR of 11 per cent, Sikhs 9.1 per cent, followed by Muslims 8.5 per cent and Hindus 7.6 per cent.

Apart from the above, the report presents a more nuanced picture if we are to look beyond the partisan debates to policy implications of the data on employment and unemployment. Three takeaway points from these data are of particular policy relevance.

- While the unemployment rate is a frequently used measure of poor performance of the economy, under conditions of rising school and college enrolment, it paints an inaccurate picture.
- The reported unemployment rate is dominated by the experience of younger Indians who face higher employment challenges and exhibit greater willingness to wait for the right job than their older peers.
- The unemployment challenge is greatest for people with secondary or higher education, and rising education levels inflate unemployment challenges.
- It is important to recognise that in a country dominated by informal sector work, remaining unemployed is possible only for individuals whose families can survive without their immediate contributions.
- The unemployment rate has been traditionally high for men with secondary or higher level of education and this is the segment in which most of the increase in unemployment is located.

Reality of jobless growth:

- Part of India's unemployment challenge lies in its success in expanding education while not expanding formal sector jobs.
- These observations taken together suggest that the roots of India's present day unemployment challenges lie in its very success.
- Educational expansion affects the unemployment debate by skewing the unemployment statistics and by creating greater competition for well-paid jobs among a rising population of educated youth.
- Rising prosperity allows young graduates to wait for well-paying jobs, creating an army of educated unemployed, before being forced to accept any work, frequently returning to family farms or starting small shops.

Way forward:

- Recognition of rising unemployment as a function of rising education forces us to grapple with different issues than a simple focus on unemployment statistics.
- If public policies such as demonetisation are responsible for rising unemployment, we would see across-the-board increase in unemployment for all age groups.
- This phenomenon is located mainly among the young and well educated reflects a challenge that goes well beyond the temporary slowdown facing India post-demonetisation.
- Creating jobs for an increasingly educated workforce and ensuring that the new workers are well equipped to enter the labour force are twin challenges that deserve greatest priority.
- Besides promoting technical education, the government needs to focus more on creation of jobs and demand for workers since industries are unable to create sufficient job opportunities for all the technically educated people
- Policies should ensure that the education systems prepare young people for the skill demands of employers through outreach programmes, training, apprenticeships, and access to job-search assistance measures
- There should be **cluster development to support job creation in micro, small and medium enterprises (MSMEs)**. Most of the **unorganised sector employment** is in MSMEs, which tend to be concentrated in specific geographic locations.
- Private sector leaders should build capacity among unskilled and semi-skilled workers to ensure sustainability of renewable energy projects and provide opportunities to rural communities.
- Government officials should create public training programmes to prepare the poor and less educated people especially semi-skilled and unskilled for employment in the clean-energy sector.

**Conclusion:**

- India has one of the youngest populations in an aging world. By 2020, the median age in India will be just 28. Demographics can change the pace and pattern of economic growth. While China's spectacular growth has already benefited from a demographic dividend, India is yet to do so.

Q) Discuss the key highlights of 'prudential framework for resolution of stressed assets' that were recently released by RBI, also discuss significance of such steps. (250 words)

Reference**Why this question:**

The question is in the context of recently released RBI's new prudential framework for resolution of stressed assets by banks.

Key demand of the question:

The answer must discuss the key features of the new prudential framework for resolution of stressed assets by banks, also one should provide for previous efforts made in this direction.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines discuss the issues plaguing the Banks of India in terms of the stressed assets.

Body:

In brief discuss –

- The new framework for resolution of bad loans, offers a 30-day gap for stress recognition instead of the one-day default earlier.
- Lenders will have complete discretion with regard to the design and implementation of resolution plans, subject to the specified timeline and independent credit evaluation.
- enders may recognize incipient stress in loan accounts, immediately on default, by classifying such assets as special mention accounts (SMA).
- For the purpose of restructuring, the definition of 'financial difficulty' to be aligned with the guidelines issued by the Basel Committee on Banking Supervision; and,
- If multiple lenders are involved, all the lenders must enter into an inter-creditor agreement (ICA) during the review period, to provide for ground rules for the resolution plan.
- Suggest what should be the way forward.

Conclusion:

Conclude with what more needs to be done.

Introduction:

- Reserve Bank of India has come out with an updated guideline about resolving stressed assets on 7th June 2019. The new guideline on resolution of stressed asset is called Prudential Framework for Resolution of Stressed Assets Directions 2019.
- The directions have been issued in terms of the provisions of Section 35AA of the Banking Regulation Act, 1949, for initiation of insolvency proceedings against specific borrowers under the Insolvency and Bankruptcy Code, 2016 (IBC).

Body:

- It is a set of guidelines to banks for tackling their stressed assets. Significance of the Prudential Framework is that it replaces the previous controversial/stringent and Supreme Court squashed stressed asset resolution guidelines published in February 2018.

Key highlights of the PFRSAD are:

- The central bank has made it voluntary for lenders to take defaulters to the bankruptcy court i.e. to use the **Insolvency and Bankruptcy Code**.
- The norms give lenders 30 days to start working on a resolution plan from the day of default.
- A lender will now have to set aside:
 - 20% more provisions if the plan is not implemented within 210 days from the date of default
 - 35% if the plan is not implemented within 365 days of default

- Besides, the new norms said that wherever necessary, the RBI will direct banks to start insolvency proceedings for specific defaults.
- The lenders may also choose to initiate legal proceedings for either insolvency or recovery.
- Meanwhile, the norms put in place penal provisions, for lenders, for resolution plans that are not implemented.
- The RBI circular also mandated signing of the inter-creditor agreement by all lenders.
- The RBI said that lenders must put in place board-approved policies for resolution of stressed assets.
- This must include the timelines for resolution.
- RBI said that it ideally expects lenders to initiate the process of implementing a resolution plan (RP) even before a default.
- During 30 days review period, lenders may decide on the resolution strategy.
- These include the nature of the RP and the approach for implementation of the RP.
- Here, the review period for defaulters of Rs.2,000 crore and above will start immediately.
- And that for defaulters between Rs. 1,500 crore and less than Rs. 2,000 crore will start only from 1 January 2020.
- The framework now applies to a larger universe of lenders including small banks and non-banking finance companies (NBFCs).
- This essentially means that the lenders will also have to follow the early stress recognition guidelines of RBI.
- These specify that borrowers must be categorized into special mention accounts based on their delay in repayment, which are:
 - Special mention account-0 (SMA-0) loans, where the repayment overdue is between 1-30 days
 - SMA-1 where the repayment overdue is between 31-60 days
 - SMA-2 where the repayment overdue is between 61-90 days

Conclusion:

- The slower-than-expected progress under the Insolvency and Bankruptcy Code (IBC) remains the key hurdle to the timely resolution of stressed assets.
- The Reserve Bank of India's (RBI) revised framework for the resolution of stressed assets is credit positive, because it brings back the focus on the need for the timely resolution of such assets, and the build-up of loan loss provisioning against those assets.

Q) In the backdrop of recently released revised prudential framework for resolution of stressed assets, "RBI's debt resolution rules are a mixed bag", Critically analyse. (250 words)

[Livemint](#)

Why this question:

The article provides for a detailed analysis of RBI's debt resolution strategies their pros and cons.

Key demands of the question:

Answer is to analyse how the steps taken by RBI had both merits and demerits and what needs to be done to manage the current prevailing conditions of stressed assets.

Directive word

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

In a few introductory lines explain the role played by RBI.

Body

Discuss the role of RBI in providing for a prudential framework for resolution of stressed assets.

Discuss what are the approaches carried out by RBI in the recent past.

Explain how changes are both good and not so good – timely resolution of sticky assets through mounting punitive provisions etc. take hints from the article and list down the pros and cons.

Suggest your opinion and conclude with fair and balanced conclusion.

Conclusion

Reassert the importance of key role played by the RBI.

**Introduction:**

- Reserve Bank of India has come out with an updated guideline about resolving stressed assets on 7th June 2019.
- The new guideline on resolution of stressed asset is called Prudential Framework for Resolution of Stressed Assets Directions 2019.
- The directions have been issued in terms of the provisions of Section 35AA of the Banking Regulation Act, 1949, for initiation of insolvency proceedings against specific borrowers under the Insolvency and Bankruptcy Code, 2016 (IBC).

Body:

The norms issued will replace all the earlier resolution plans such as

- Framework for revitalising distressed assets,
- Corporate debt restructuring scheme,
- Flexible structuring of existing long-term project loans,
- Strategic debt restructuring scheme (SDR),
- Scheme for sustainable structuring of stressed assets (S4A), and
- Joint lenders' forum with immediate effect.

Key highlights of new framework:

- The new framework for resolution of bad loans, offers a 30-day gap for stress recognition instead of the one-day default earlier.
- Lenders will have complete discretion with regard to the design and implementation of resolution plans, subject to the specified timeline and independent credit evaluation.
- Lenders may recognise incipient stress in loan accounts, immediately on default, by classifying such assets as special mention accounts (SMA).
- For the purpose of restructuring, the definition of 'financial difficulty' to be aligned with the guidelines issued by the Basel Committee on Banking Supervision; and,
- If multiple lenders are involved, all the lenders must enter into an inter-creditor agreement (ICA) during the review period, to provide for ground rules for the resolution plan.

Pros:

- RBI now allows banks up to 30 days after the default to consider the future path of action, and affords them more latitude in taking defaulters to insolvency courts
- The key change here is **RBI's carrot-and-stick approach**. Lenders effectively get 30 days to negotiate with defaulters before putting in motion a 180-day resolution plan with other lenders.
- the process of kicking off a resolution plan has also been eased with assent required from only 75% of lenders by debt value, and 60% by number, unlike earlier where all lenders had to agree to the resolution plan
- the new circular now includes other lending agents like term-lending financial institutions (such as Exim Bank or Small Industries Development Bank of India), non-banking financial companies (NBFCs) and small finance banks, which somewhat evens out the misaligned regulatory plane.
- The focus remains on timely resolution of sticky assets through mounting punitive provisions.

Cons:

- By not resolving a default in effectively 210 days and by not dragging defaulters to insolvency courts, banks will have to make higher and penal provisions.
- With close to 70% of assets in the state-owned banking system, where tenured bankers have little or nil incentive to pursue resolution, the likelihood of higher provisioning acting as a disincentive is suspect.
- Two other important credit providers remain outside the regulatory ambit: mutual funds and private equity companies, which have become large credit dispensers and, in some cases, active participants in the evergreening of non-performing assets, without necessarily investing in the requisite credit appraisal skills.
- Mutual funds, in particular, have been caught on the wrong foot after lending against the security of pledged shares and with exposures to dodgy NBFCs.

Way forward:

- The onus then must shift to the government which has proclaimed the Insolvency and Bankruptcy Code (IBC) among its key achievements.
- The government has to ensure that large corporates do not game the system, as some of the large corporate defaulters have successfully done so far by arbitraging the asymmetric legal framework.
- Unlike RBI, the government has the legislative remit to construct a concrete track to insolvency courts for defaulters.

**Conclusion:**

- The slower-than-expected progress under the Insolvency and Bankruptcy Code (IBC) remains the key hurdle to the timely resolution of stressed assets.
- The Reserve Bank of India's (RBI) revised framework for the resolution of stressed assets is credit positive, because it brings back the focus on the need for the timely resolution of such assets, and the build-up of loan loss provisioning against those assets.

Q) “India’s workforce is masculinizing rapidly”, Critically analyse the statement in the light of recently released official data on Labour Force Participation Rate (LFPR). (250 words)

[Livemint](#)

Why this question:

Representation of women in India’s workforce is at a historic low, and even those who work long hours for low pay, shows latest employment survey.

Key demand of the question:

The answer must evaluate in detail the recently released official employment survey of India.

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer**Introduction:**

In a few introductory lines bring out the highlights of the survey.

Body:

Answers must discuss the following aspects –

- What are the concerns posed by the gender gap scenario in the employment aspect of the country?
- over three out of four women over the age of 15 in India are neither working nor seeking work. This would imply that they are most likely running the house and taking care of children.
- Then move on to explain the factors responsible for such a fall in working rates of women.
- Take cues from the article, suggest data across the sectors, women of all age groups etc.
- Suggest what needs to be done to overcome such concerns and challenges.

Conclusion –

Conclude with way forward.

Introduction:

- The recently released **periodic labour force survey (PLFS)** data published by the **NSSO** shows that **India’s female Labour Force Participation Rate (LFPR)**—the share of working-age women who report either being employed, or being available for work—has fallen to a historic low of 23.3% in 2017-18, meaning that over three out of four women over the age of 15 in India are neither working nor seeking work.

Body:**Highlights of the report:**

- Just nine countries around the world, including Syria and Iraq, now have a fewer proportion of working women than India, new official data confirms.
- If Bihar were a country, it would have the lowest share of working women in the world. Bihar has by far the lowest rates of female workforce participation, while the southern and eastern states do better.
- Among urban women who do work, domestic cleaning work is the second most common profession after textile-related jobs.
- While the LFPR for women aged 15-29 fell by eight percentage points between 2011-12 and 2017-18 to 16.4%, the LFPR for women fell by at least seven percentage points for every age bracket between 30-50 as well.
- Among women in the prime working ages of 30-50, more than two in three women are not in the workforce, with the majority of them reporting that they are “attending to domestic duties only”
- Muslim women have the lowest LFPR while among Hindu women, forward caste women have the lowest LFPR, implying that social norms and religious conservatism might play a role in women being “allowed” to work.

- rural women work overwhelmingly in agriculture, which could offer a clue to understanding the falling rates of rural workforce participation. It is likely that non-farm jobs are rare, especially for women.
- 99% of (women workers described as directors and chief executives) were self-employed, of which around one-third worked as unpaid family workers

Factors responsible for such a fall in working rates of women:

- **Maternity:** Many women who join the workforce are unable to re-join after having a child.
- The landmark legislation Maternity Benefit Act, 2017, which entitles a woman to 26 weeks of paid maternity leave, is becoming a big hurdle as start-ups and SMEs have become reluctant to hire them.
- The increased cost for companies and this may discourage them from hiring women.
- The share of women workers in the agriculture sector dropped from 42% in 2004 -05 to 35.5% in 2011-12. This decrease in FLPR in agriculture can be attributed to **increased adoption of technology in agriculture**.
- The **gender pay gap was 34 per cent in India**, that is, women get 34 per cent less compared to men for performing the same job with same qualifications.
- In the organised sector, women professionals even in the highest ranks of labour (legislators, senior officials, and managers) are also paid less compared to their male counterparts. However, these women constitute only one per cent of the total female work force and the gap is lowest as they are aware of their rights.
- **Concerns about safety and Harassment at work site**, both explicit and implicit.
- According to NSSO, urban males accounted for 16% of India's population, but held 77% of all jobs in computer-related activities in 2011-12. This shows how gender has become a discriminatory factor for certain white-collared jobs.
- **Higher Education levels of women** also allow them to pursue leisure and other non-work activities, all of which reduce female labour force participation.
- **Insufficient availability of the type of jobs** that women say they would like to do, such as regular part-time jobs that provide steady income and allow women to reconcile household duties with work.
- According to the reports, about 74 per cent in rural areas and about 70 per cent in urban areas preferred 'part time' work on a regular basis while 21 per cent in rural areas and 25 per cent in urban areas wanted regular 'full-time' work.
- **Marriage is a career stopper** for the majority of Indian women and this cultural abhorrence towards women working is a not-so-subtle way of ensuring that the escape routes out of a marriage are minimised, if not entirely closed
- Social norms about household work are against women's mobility and participation in paid work. **Childbirth and taking care of elderly parents or in-laws** account for the subsequent points where women drop off the employment pipeline.
- The **cultural baggage about women working outside the home** is so strong that in most traditional Indian families, quitting work is a necessary precondition to the wedding itself.
- When **increases in family incomes** are there, due to the cultural factors, women leave the work to take care of the family and avoid the stigma of working outside.

Way forward:

- **Non-farm job creation for women:** there is a need to generate **education-based jobs in rural areas** in the industrial and services sectors
- The **state governments** should make **policies for the participation of rural women in permanent salaried jobs**.
- The governments should also **generate awareness to espouse a positive attitude towards women** among the public since it is one of the most important impediments in women's participation in economic activities.
- Local bodies, with aid from state governments, should open more crèches in towns and cities so that women with children can step out and work. The crèches will open employment opportunities for women.
- **Supply side reforms** to improve infrastructure and address other constraints to job creation could enable more women to enter the labour force.
- **Higher social spending**, including in education, can lead to higher female labour force participation by boosting female stocks of human capital.
- **Skilling the women:**
 - Initiatives such as **Skill India, Make in India, and new gender-based quotas from corporate boards to the police force** can spur a positive change. But we need to **invest in skill training and job support**.

- The private sector could also take active part in training women entrepreneurs. For example: Unilever's Shakti program, which has trained more than 70,000 rural women in India as micro-entrepreneurs to sell personal-care products as a way of making its brands available in rural India
- **Equal pay:** The principle of equal remuneration for work of equal value that is protected by Indian law must be put to actual practice. Improved wage-transparency and gender neutral job evaluation is required to achieve this end.
- **Assuring safe access to work:** It is important to improve existing transport and communication networks and provide safe accommodation for women who travel to or has migrated for work.
- A useful and easily implementable idea would be to give **income tax benefits to women**. It would be a bold and effective step to increasing India's female workforce participation.
- For political empowerment of women, their **representation in Parliament and in decision making roles in public sphere** is one of the key indicators of empowerment.
- **Gig Economy** provides women flexible work options to pursue their career while not missing important milestones in their family lives.
- Drawing more women into the labour force, supplemented by structural reforms that could help create more jobs would be a source of future growth for India. Only then would India be able to reap the benefits of "demographic dividend" from its large and youthful labour force.

Conclusion:

- With more than 75% women not contributing to the economy, the nation is not only losing on the economic part but also the development of 50% of our population. The numeric consequences of reducing obstacles to women's full economic participation far exceed the demographic advantages of having a larger pool of young workers. It is thus high time to talk of the gender dividend along with the demographic dividend.

Q) What is the meaning of the term 'Jobless growth' ? Has India been experiencing such a growth process ? How far Skill India programme would address the jobless growth phenomenon in India ? (250 words)

[Livemint](#)

[The hindu](#)

Introduction:

- **Jobless growth is a multi-cause, systemic problem.** In a jobless growth economy, unemployment remains stubbornly high even as the economy grows.
- This tends to happen when a relatively large number of people have lost their jobs, and the ensuing recovery is insufficient to absorb the unemployed, under-employed, and those first entering the workforce.
- Jobless growth of the Indian economy is a **"5C" problem: a Complicated Condition Created by Combinations of Causes**.

Body:

Jobs scenario in India

- CMIE and labour Bureau data indicates that India continues to face the jobless growth problem
- Multiple data sources clearly show that job opportunities in India are, at present, limited, with the average annual addition to regular jobs during 2012-16 falling to 1.5 million from 2.5 million in 2004-12.
- Besides, job creation in India's organized manufacturing sector experienced a sharp fall in 2012, later recovering only to a level considerably below any prior year during 2006-12.
- Furthermore, the share of regular workers with any form of social security has declined from 45% in 2011-12 to 38% in 2016.
- the labour force participation rate has declined systematically. It was 43% in 2004-05, 40% in 2009-10, 39.5% in 2011-12 and 36.9% in 2017-18.
- Rapid advances in digital technologies and automation are displacing people from work in all sectors of the economy—in manufacturing, in services, and even in knowledge industries.

Skill India can tackle Jobless growth:

- In the words of the Mahatma, "The brain must be educated through the hand. The teacher must learn the craft and correlate his knowledge to the craft. The craft cannot be separated from education."
- Under Skill India Mission, the Ministry of Skill Development and Entrepreneurship is implementing a flagship scheme PMKVY with an objective to provide skilling to one crore people across the country for four years (2016-2020).

The **impacts of the SKILL INDIA mission** in the last 4 years are:

- NSQF **recognises prior learning**, through which an estimated **20 million school dropouts** can get a second chance.
- There is a **substantial increase** in the number of people who were skilled in FY17 and FY18. Notably, the rise is phenomenal, it has risen more than four times, from over 3.5 lakh people in FY17 to nearly 16 lakh people in FY18.
- About **30% of the skilled persons** have found jobs under the mission in FY2018.
- With nearly **55 percent successful placements**, the **Short-Term Training Program (STT)** under **PMKVY (2016-20)** has **successfully trained over 13 lakh candidates**.
- Approximately **76 percent** of the candidates have been placed in **wage employment** and **24 percent placed in self-employment/ entrepreneurship**.
- **Recognition of Prior Learning (RPL)** is designed for those who already have a job or are self-employed and require up-skilling and certification for better prospects. Till date, more than 4.5 lakh candidates have been certified under this component of **PMKVY (2016-20)**.

However, challenges remain:

- The **targets allocated are very high** and without regard to any sectoral requirement. Everybody was chasing numbers without providing employment to the youth or meeting sectoral industry needs.
- The focus of PMKVY has been **largely on the short-term skill courses**, resulting in low placements. There has been an over emphasis on this scheme and hence it is seen as the answer to all skill-related issues.
- The **Comptroller and Auditor General (CAG)** has pointed out flaws in the design and operations of the NSDC and National Skill Development Fund which has resulted in falling short of skill development goals. Majority of them also could not achieve the placement targets for the trained persons.
- The **Sharada Prasad Committee**, held the NSDC responsible for poor implementation of the **Standard Training Assessment and Reward (STAR) programme**. It highlighted that **only 8.5 per cent of the persons trained were able to get employment**. That is what has been claimed by NSDC.
- The Report also cites “**serious conflict of interests**” in the functioning of the National Skill Development Corporation. NSDC has not been able to discharge its responsibilities for setting up **sector skill councils (SSCs)** owing to lots of instances of serious conflict of interest and unethical practices.
- The skilling courses are not in line with the **Industrial Revolution 4.0** which is round the corner.
- There have been apprehensions on **how many of the 11.7 million trained in the past two years** are really in jobs.

Other supporting measures needed along with SKILL INDIA:

- Improving the labour market information system where emerging demand for skills are spotted quickly and the necessary training and certifications for the same are created.
- Quick improvements in public-private partnership in capturing demand for skills and following through with quick investments in skill-building to match demand with supply.
- Jobs and skills planning should be decentralized and it has to be done at state and district levels, where there is granular information on education, skills and job options.
- Implementing a new model of manufacturing which is high-skilled, and where high-end cottage manufacturing can create employment at the small scale level.
- If urbanization is good and well planned, then job growth will be positive. Government should concentrate on the development of towns and narrow areas and service it with good infrastructure to generate employment alongside development.
- If government starts spending on public goods (schools, hospitals, dams, roads etc.) instead of spending on freebies (deep subsidies on food, farm loan waivers etc.) the capacity of government to create employment increases.

Conclusion:

- India needs a new strategy to counter the phenomena of jobless growth. This requires manufacturing sector to play a dominant role.
- The focus of economic policy must be the creation of jobs and creating an enabling policy for youth to take up entrepreneurship and create more jobs in the market. India does not need five companies worth 5000 crores turnover but needs 5000 companies of 5 crore turnover.

Q) Indian economy, polity and demography has undergone many changes from last 70 years. In this context, is it the right time to revisit the India's Fiscal Federalism ? Critically comment. (250 words)

The hindu

Introduction:

- Fiscal federalism is **the financial relations between units of governments in a federal government system**. It is part of broader public finance discipline. The term was introduced by the German-born American economist **Richard Musgrave** in 1959. Fiscal federalism deals with the division of governmental functions and financial relations among levels of government.
- India has a federal form of government, and hence a federal fiscal system. For successful operation of federal form of government, **financial independence and adequacy** forms the backbone. The Economic Survey 2017-18 highlighted the need for fiscal federalism.

Body:

The needs to revisit the Indian fiscal federalism are:

- **Trends in Tax Revenue:**
 - A look at the composition of central and states' own taxes and expenditure reveal that the share of the own tax revenue and expenditure of the states is 38% and 58% respectively.
 - This reflects the more than proportionate expenditure obligations of the states and also the lesser revenue raising powers vis-à-vis the centre.
 - The centre has buoyant sources of revenue like personal income tax, corporation tax, excise duty, customs duty and service tax. However, the tax-gross domestic product (GDP) ratio of the centre has stagnated by 11% on an average, during the period 1970-71 to 2016-17.
- **Trends in Transfer of Central Resources:**
 - The transfer of resources to states comprises taxes collected by the Union, statutory grants under Article 275 based on the recommendations of the finance commissions, grants given as central share in centrally sponsored schemes (CSS), other discretionary grants, and until 2015-16, formula-based grants for state plans under the Gadgil formula.
 - The transfer of central resources can be broadly classified into tied and flexible grants. The former is a conditional grant which comes with a scheme and has conditionalities. The state has no flexibility in deciding how to spend it. The CSS grants fall under this category.
- **Trends in Tax Devolution:**
 - Under Article 270 of the Constitution, the net proceeds of all taxes levied by the union, except surcharges and cesses are shareable with the states after the 80th Constitutional Amendment.
 - **Net proceeds** are defined in Article 279 of the Constitution as gross tax revenue of the centre less surcharges and cesses, and cost of collection. However, the amount of net proceeds is not published in the budget documents of the union. But, the proportion of surcharges and cesses to gross tax revenue of the centre is rising, and this is neutralising the higher shares recommended by the successive finance commissions.
 - Surcharges and cesses are levied for the purpose of the union and are not shareable with the states, according to the provisions of Article 271 of the Constitution.
 - The lack of transparency in computation of net proceeds has also caused losses to the states.
- **FRBM Acts and Asymmetric Impacts:**
 - The FRBM acts were passed at the level of the centre and the states in the beginning of the 2000s.
 - It laid emphasis only on achieving targets. In the bargain, if revenues could not be raised, expenditure (even essential) would be cut.
 - The states have been forced to limit their deficits due to sanctions by the finance commissions, whereas the centre is not bound by any such conditionalities.
 - The FRBM review committee recommendations have been unilaterally accepted by the centre without consulting the states. This is against the basic tenets of cooperative federalism.
- **Inefficient Cash Management by States:**
 - The states do not spend essentially due to the fear of the consequences of non-adherence to deficit targets, which are not only a legislative constraint but also a conditionality imposed by the finance commissions.

- The perversity of this is such that states are not only forced to adhere to deficit targets, but also to provide cheap financing to the centre, which has not adhered to deficit targets noted in the FRBM acts.
- **Post-GST Scenario**
 - The voting rights in the GST Council are in the provisions of Article 279A of the Constitution. The states have two-thirds and the centre one-third voting rights. But to pass a resolution, three-fourths majority is required. This in effect confers a **veto power for the centre**, even when states jointly propose a change. The states should be able to adopt a change in their tax structure without the centre's consent. The voting rights envisaged under Article 279A has made this impossible.
 - The committee on **revenue neutral rates (RNR)** of the central government had suggested the apportionment between the states and the centre at 60:40 ratio, as almost 44% of states' own tax revenue was subsumed under the GST as against 28% for the centre. It still retains the power to levy additional excise duty on tobacco products, even though it has been brought under the GST. States do not have such a right.
 - The centre also took a long time in implementing the anti-profiteering clause of the GST.
- **ToR of the Fifteenth Finance Commission:**
 - There is an apprehension that it will reduce the states' capacity to intervene in social and economic sectors.
 - ToR suggests **whether there should be revenue deficit grants** at all. This is ToR is a bolt from the blue with regard to the state finances that are already stressed by the impending pay commission award implementations, the obligation to bear the future interest burden from floating UDAY bonds and stagnation in the GST revenues.
 - The proposed enlargement of restrictive conditions is a move towards fiscal centralisation and acts counter to cooperative federalism.
 - The ToR 7 also mandates the Fifteenth Finance Commission to assess and monitor performance of several aspects, including GST implementation, and other governance and achievement indicators. The finance commission's becoming a monitoring agency of states' performance does not befit its constitutional role.
- **Empowering Local Governments:**
 - The LGs in India are still a shadow of "institutions of self-government" envisaged in the Constitution.
 - A major impediment for substantial progress in decentralisation to LGs is the lack of any initiative to restructure centre-state relations in India.
 - The vast differences in the decentralisation experience across the states, which is the consequence of the varying degrees of political will.

Way forward:

- Perhaps the time has come for the Constitution to be amended and the proportion of shareable taxes that should go to the States fixed at the desired level.
- The shareable tax pool must also include cesses and surcharges as these have sharply increased in recent years. Fixing the ratio at 42% of shareable taxes, including cesses and surcharges, seems appropriate.
- Another possible route is to follow the practice in the U.S. and Canada: of allowing the States to levy tax on personal income, with some limitations.
- The freedom given to the States must be limited. It is important to note that the levy by the Centre and States together should be reasonable. Also once this power is given to the States, the transfers from the Centre need adjustment.
- **Horizontal Distribution:** The ability of bringing about equalisation across States in India has limitations. Even the relatively richer States have their own problems and they feel 'cheated' because of the overuse of the equity criterion. An appropriate balancing of criteria is needed particularly in the context of the rise in unconditional transfers.

Conclusion:

- There is an urgent need to tackle the above challenges in fiscal federalism by using the co-operative federalism to ensure socio-economic development of India.

Q) What is the potential of India's MSME sector ? Discuss the challenges and concerns associated with the growth of MSME sector in India. (250 words)

[Indianexpress](#)

Why this question:

The article discusses the findings of the committee set up to undertake a comprehensive review of the micro, small and medium enterprises (MSME) sector, which has submitted its report to the RBI, It has examined issues such as access to finance and infrastructure bottlenecks that continue to plague the sector.

Key demand of the question:

The answer must discuss in detail the potential of the MSME sector and the challenges it is facing in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with some statistics/data related to MSMEs in India.

Body:

Discussion should include the following:

- What are the issues plaguing the MSME sector? – fiscal indiscipline, lack of infrastructure, Limited capital and knowledge and Non-availability of suitable technology are few critical issues in this sector, Ineffective marketing strategy, Constraints on modernization and expansions and Non-availability of skilled labour at affordable cost.
- Explain the potential it holds in India.
- Then move on to discuss what measures need to be considered? What needs to be done?

Conclusion:

Conclude by stating that the only way to create millions of jobs with decent wages is a policy re-imagination of the rights, needs, and treatment of formal MSME entrepreneurs.

Introduction:

- Micro, Small & Medium enterprises (MSME) termed as “**engine of growth**” for India, has played a prominent role in the development of the country in terms of creating employment opportunities.
- The government, in conjunction with the Reserve Bank of India (RBI), has now launched a series of measures to alleviate their distress.

Body:

Potential of India's MSME sector:

- **Contribution to GDP:** The share of MSMEs in the **country's gross value added is estimated to be about 32%.**
- **Leveraging Exports:** It also contributes about **40% to total exports and 45% to manufacturing output.**
- **Employment Opportunities:** It employs 60 million people, creates 1.3 million jobs every year and produces more than 8000 quality products for the Indian and international markets.
- **Diversity:** There are approximately 30 million MSME Units in India and is quite diverse in terms of its size, level of technology employed, range of products and services provided and target markets.
- **Fostering Inclusive Growth:** MSME is constructing inclusive growth in numerous ways through promoting non-agricultural livelihood at least cost, unbiased regional development, large female participation, and providing a protection against deflation.

The challenges and concerns associated with the growth of MSME sector:

- **Access to Credit:**
 - According to Economic Survey (2017-18), MSME sector faces a major problem in terms of getting adequate credit for expansion of business activities.
 - The Survey had pointed out that the MSME received only 17.4 per cent of the total credit outstanding.
 - Most banks are reluctant to lend to MSMEs because from the perspective of bankers, inexperience of these enterprises, poor financials, lack of collaterals and infrastructure.
- **Poor Infrastructure:**
 - With poor infrastructure, MSMEs' production capacity is very low while production cost is very high.

- **Access to modern Technology:**
 - The lack of technological know-how and financial constraints limits the access to modern technology and consequently the technological adoption remains low.
- **Access to markets:**
 - MSMEs have poor access to markets. Their advertisement and sales promotion are comparatively weaker than that of the multinational companies and other big companies.
 - The ineffective advertisement and poor marketing channels makes it difficult for them to compete with large companies.
- **Legal hurdles:**
 - Getting statutory clearances related to power, environment, labour are major hurdles.
 - Laws related to the all aspects of manufacturing and service concern are very complex and compliance with these laws are difficult.
- **Lack of skilled manpower:**
 - The training and development programs in respect of MSME'S development has been. Thus, there has been a constant crunch of skilled manpower in MSMEs

Other issues:

- Low ICT usage.
- Low market penetration.
- Quality assurance/certification.
- IPR related issues.
- Quality assurance/certification.
- Standardization of products and proper marketing channels to penetrate new markets.

Measures needed:

- Government of India and banks should design plans and measures to widen easy, hassle-free access to credit.
- The RBI should bring stringent norms for Non-Performing Assets (NPA) and it will help curbing loan defaulters and motivate potential good debts. Further, according to critics, the Credit Guarantee Scheme for MSME (CGTMSE) run by SIDBI is a growing contingent liability and needs to be examined with urgency
- Government should provide enhanced development and upgradation of existing rail & road network and other infrastructure facilities in less developed and rural areas to boost growth and development of MSMEs
- There should proper research and development in respect of innovative method of production and service rendering. Further, the government should promote and subsidise the technical know-how to Micro and small enterprises.
- Government should encourage procurement programme, credit and performance ratings and extensive marketing support to revive the growth of sick units.
- Skill development and imparting training to MSME workers is a crucial step to increase the productivity of the sector. The government should emphasise predominantly on skill development and training programs

Conclusion:

- MSMEs being the growth engine of economy, there is a need to prepare a roadmap for sector in addition to the ad-hoc initiatives undertaken.
- Delineation of the objectives, vision, and mission is necessary to give clarity on the path to be treaded.
- An inclusive, sustainable vision to compete with the global MSMEs, by collaborating the industry groups, researchers, government and other stakeholders is the need of the hour.

TOPIC: Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Q) What do you understand by Generalized System of Preferences (GSP) ? Discuss the features in detail. Quote the reasons for which US withdrew GSP with India the repercussions of the same and what should India do ? (250 words)

Economictimes

Why this question:

The article brings out a detailed discussion of Generalized System of Preferences (GSP), US-India trade relations amidst US's withdrawal from GSP with India. The US terminated preferential tariffs to Indian exports on Friday after determining that it has not committed to provide "equitable and reasonable access to its markets" for the US.

Key demands of the question:

The answer should discuss the concept of Generalized System of Preferences (GSP), reasons of failure of the agreement between India and US, what are the repercussions of the same on India and what should India do to overcome the concerns posed by such a system.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what you understand by GSP.

Body:

Answer must discuss the following:

- The Generalized System of Preferences (GSP) is a U.S. trade program designed.
- Discuss its Features – These are unilateral, non-reciprocal and non-discriminatory benefits extended by U.S. to promote economic growth in the developing world by providing preferential duty-free entry for up to 4,800 products from 129 designated beneficiary countries and territories.
- Timeline: GSP was instituted on January 1, 1976, by the Trade Act of 1974. The GSP program has effective dates which are specified in relevant legislation, thereby requiring periodical reauthorization in order to remain in effect.
- Explain that the US terminated preferential tariffs to Indian exports after determining that it has not committed to provide “equitable and reasonable access to its markets” for the US.
- Some of the key reasons cited by trump administration are trade imbalance with India, no access to Indian market for us dairy, medical device industry and issues related to data localization norms.
- Benefit Restoration: As per US norms, a beneficiary country must meet 15 discretionary and mandatory eligibility criteria established by Congress to qualify for GSP. These include providing the US with equitable and reasonable market access, combating child labour, respecting internationally recognized worker rights and providing adequate and effective intellectual property rights protection.

However, reinstatement of GSP benefits is conditional.

Conclusion:

Conclude with what should be India’s way forward.

Introduction:

- The Generalized System of Preferences (GSP) is a U.S. trade program designed to promote economic growth in the developing world by providing preferential duty-free entry for up to 4,800 products from 129 designated beneficiary countries and territories.
- It was instituted on January 1, 1976, by the Trade Act of 1974. GSP has been given on non-reciprocal basis yet the US has linked it with market access and tariff reduction which is against the basic tenets of GSP.

Body:

Significance of GSP:

- It is an umbrella that comprises the bulk of preferential schemes granted by industrialized nations to developing countries.
- It involves reduced Most Favoured Nations (MFN) Tariffs or duty-free entry of eligible products exported by beneficiary countries to the markets of donor countries.
- Economic growth and development in the developing world by helping beneficiary countries to increase and diversify their trade with the developed nations.
- Employment – Moving GSP imports from the docks to consumers, farmers, and manufacturers supports tens of thousands of jobs in the developed nation.
- Company Competitiveness is boosted by GSP as it reduces costs of imported inputs used by companies to manufacture goods.
- GSP promotes Global values by supporting beneficiary countries in affording worker rights to their people, enforcing intellectual property rights, and supporting the rule of law.

Reasons for withdrawal of GSP:

- The United States of America (USA) President Donald Trump has terminated India's designation as a beneficiary developing nation under the GSP (Generalized System of Preference) trade program with effect from 5th June 2019.
- India no longer complied with the statutory eligibility criteria.
- The trigger for the latest downturn in trade ties was India's new rules on e-commerce that restrict the way Amazon.com Inc. and Walmart-backed Flipkart do business in a rapidly growing online market set to touch \$200 billion by 2027.
- That, coming on top of a drive to force global card payments companies such as Mastercard and Visa to move their data to India and the imposition of higher tariffs on electronic products and smartphones, left a broader trade package the two sides were working on through last year in tatters.

Repercussions of withdrawal of GSP on India:

- India exports nearly 50 products of the 94 products on which GSP benefits are stopped.
- India is the largest beneficiary nation under the GSP scheme and exported goods worth \$6.35 billion to the U.S. under the preferential regime last year.
- This is close to 10% of the goods exported by India to the U.S. While the Indian reaction to the American decision has been mild so far that the Commerce Ministry termed it "unfortunate".
- The GSP removal will leave a reasonable impact on India as the country enjoyed preferential tariff on exports worth of nearly \$ 5.6 billion under the GSP route out of the total exports of \$48 bn in 2017-18.
- Removal of GSP indicates a tough trade position by the US; especially for countries like India who benefited much from the scheme.
- India is the 11th largest trade surplus country for the US and India enjoyed an annual trade surplus of \$ 21 bn in 2017-18.

Way forward:

- Indian exports to the US under GSP program are mostly intermediaries and are not in direct competition with US producers which ultimately benefit US economy.
- The US should consider continuing India's eligibility as a gesture of goodwill that reaffirms its commitment to the mutually beneficial relationship between our two countries.
- GSP remains a central aspect of the overall trade engagement and must remain available for Indian exporters keen to address the US markets.
- India needs to ensure a similar level of economic engagement with the rest of the world.

Q) Do you think Foreign Contribution (Regulation) Act violates international human rights standards on freedom of association? Critically examine. (250 words)

The hindu

Why this question:

Recently Union Home Ministry has warned of taking penal action against NGOs who have changed office bearers without taking its approval.

Key demand of the question:

The answer must evaluate in detail FCRA, and the recent actions taken in this direction by the govt.

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer

Introduction:

In a few introductory lines state what is FCRA – The Foreign Contribution Regulations Act (FCRA) is used to regulate foreign contribution (especially monetary donation) provided by certain individuals or associations to NGOs and others within India.

Body:

Answers must discuss the following aspects –

- What are the concerns associated with the FCRA?

- Explain the recent steps taken by the govt. – In a notification, Union Home Ministry said, some incidents have come to light that some NGOs, having registered under Foreign Contribution Regulation Act (FCRA), have changed their office bearers without its approval.
- The Home Ministry said, replacement of key functionaries of FCRA registered organizations without prior permission is a violation of the law.
- The Ministry has asked the NGOs to submit applications for addition or deletion or any change of details about office bearers within one month from the date of issue of notice.
- Conclude with what needs to be done to overcome such concerns and challenges.

Conclusion –

Conclude with way forward.

Introduction:

- Foreign Contribution Regulation Act (FCRA) is a consolidating act passed by the Government of India in the year 2010. It seeks to **regulate the foreign contributions or donations and hospitality (air travel, hotel accommodation etc) to Indian organizations and individuals** and to stop such contributions which might damage the national interest.
- Since the Act is internal security legislation, despite being a law related to financial legislation, it falls into the purview of Home Ministry and not the Reserve Bank of India (RBI). The Home Ministry has warned NGOs, who have changed their office-bearers and key functionaries without informing the Ministry, with penal action, if they fail to do so within a month.

Body:

Need for FCRA:

- It is an act passed for **regulating and prohibiting the acceptance and utilization of foreign contribution or foreign hospitality by companies, associations or individuals for such activities that could prove to be detrimental to the national interest** and for matters connected therewith or incidental thereto.
- The act aims at keeping a check on foreigners influencing the Indian electoral politics, journalists, public servants etc. for wrong purposes or activities detrimental to the public interest.
- Those violating the provisions of FCRA can be jailed up to a term of 5 years

Concerns with FCRA:

The Act imposes various conditions on the use of foreign funds and some of them are as follows:

- The Act permits only NGOs having a definite cultural, economic, educational, religious or social programme to accept foreign contribution, that too after such NGOs either obtain a certificate of registration or prior permission under the Act.
- All funds received by a NGO must be used only for the purpose for which they were received.
- Such funds must not be used in speculative activities identified under the Act.
- Except with the prior approval of the Authority, such funds must not be given or transferred to any entity not registered under the Act or having prior approval under the Act.
- Every asset purchased with such fund must be in the name of the NGO and not its office bearers or members.
- In order to be registered under the FCRA, an NGO must be in existence for at least three years and must have undertaken reasonable activity in its field for which the foreign contribution is proposed to be utilised. Further, it must have spent at least INR 1,000,000 over three years preceding the date of its application on its activities.
- The registration certificate is valid for a period of five years and must be thereafter renewed in the prescribed manner.
- NGOs not eligible for registration can seek prior approval from FCRA for receiving foreign funding. This permission is granted only for a specific amount of foreign funding from a specified foreign source for a specific purpose. It remains valid till receipt and full utilisation of such amount.

FCRA and NGO's:

- NGOs play an important role in the upliftment of the weaker sections of the society and their overall development.
- This is especially true in the case of India, where a vast majority of its population continues to remain under the poverty line and have little or no access to even basic facilities provided by the government.
- Every NGO registered or having prior approval under the Act must file an annual report with the Authority in the prescribed form.
- This report must be accompanied by an income and expenditure statement, receipt and payment account, and balance sheet for the relevant financial year.

- For financial years where no foreign contribution is received, a 'NIL' report must be furnished with the Authority.
- In case of non-compliance with provisions of the FCRA, the government can penalize an NGO. For example, if these NGOs don't file annual returns, the government can issue a show-cause notice and subsequently, suspend or cancel their foreign funding licenses.
- In the last two years, licenses of around 20000 NGOs have been cancelled by the central government after they were found violating various provisions of FCRA act. Hence those NGOs were barred from receiving any foreign funds.

FCRA and spirit of international laws:

- According to the UN Special Rapporteur on the Rights to Freedom of Peaceful Assembly and of Association – the FCRA provisions and rules “are not in conformity with international law, principles and standards” because:
- Access to resources, particularly foreign funding, is a part of the right to freedom of association – is a part of Universal Declaration of Human rights (Article 20), meaning a violation of this right constitutes a human rights violation.
- Restrictions in the name of “public interest” and “economic interest” as listed under the FCRA rules fail the test of “legitimate restrictions”. The terms are too vague and give the state excessive discretionary powers to apply the provision in an arbitrary manner

Way forward:

- A **National Accreditation Council** consisting of academicians, activist, retired bureaucrats should be made to ensure compliance by NGOs.
- There should be better coordination between Ministries of Home Affairs and Finance in terms of monitoring and regulating illicit and unaccounted funds.
- A regulatory mechanism to keep a watch on the financial activities of NGOs and voluntary organizations is the need of the hour.
- Citizens today are keen to play an active role in processes that shape their lives and it is important that their participation in democracy go beyond the ritual of voting and should include promotion of social justice, gender equity, inclusion etc.

Q) What do you understand by cryptocurrency? Do you think legalising the crypto market can help beneficiaries emerge from the shadows and make productive investments in an economy witnessing a digital transformation? Critically analyse. (250 words)

[The hindubusinessline](https://www.insightsias.com/the-hindubusinessline)

Why this question:

The article discusses the current conditions of crypto market world across and the pros and cons associated, it analyses how cryptocurrency is something that can not be rejected as an idea in whole, rather world has to move forward and see it as a possibility with advantages in the ongoing digital transformation.

Key demand of the question:

Explain what you understand by cryptocurrencies; there advantages, disadvantages, debate upon whether they should be allowed.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with brief introduction on what you understand by

Body:

Discussion should include the following: cryptocurrencies – It is a digital currency which allows transacting parties to remain anonymous while confirming that the transaction is a valid one. It is not owned or controlled by any institution – governments or private.

There are multiple such currencies bitcoin, ethereum, ripple are some of the popular ones. Currently, they are neither illegal nor legal in India.

Debate whether they should be used or banned? Discuss the Indian scenario. Weigh the pros and cons, take clues from the article, relate it to the current digital transformation era.

Conclusion:

Conclude with a fair and balanced opinion.

Introduction:

- A cryptocurrency is a digital or virtual currency that uses cryptography for security. Cryptocurrencies use decentralized technology to let users make secure payments and store money without the need to use their name or go through a bank. They run on a distributed public ledger called blockchain, which is a record of all transactions updated and held by currency holders. The most common cryptocurrencies are Bitcoin, Ethereum, Ripple, and Litecoin.
- **Facebook** has announced a digital currency called **Libra** that will roll out for use in 2020 and allow the platform's billions of users across the globe to make financial transactions online.

Body:

Benefits of legalizing the crypto market:

- Proper regulation of these currencies will "promote" a formal tax base, while keeping a tab on their use for illegal activities such as money laundering, terror funding and drug trafficking.
- Trading of bitcoins would be brought under the stock market regulator, Securities and Exchange Board of India (SEBI).
- Bitcoins can be traded on registered exchanges which will promote a formal tax base. Returns from investment in Bitcoins would be taxed.
- Use of bitcoins for illegal activities such as money laundering, terror funding and drug trafficking can be checked.
- If any foreign payment is made through Bitcoins, it would fall under the purview of Foreign Exchange Management Act,
- Cryptocurrencies have gained popularity in the last few years. Currently, they are neither illegal nor legal in many countries including India. The market cap for all crypto-currencies has just crossed \$100 billion, with most of the increase coming in the past few months.
- Banning will give a clear message that all related activities are illegal and will disincentivise those interested in taking speculative risks.
- Regulating the currency instead would signal a boost to blockchain technology, encourage the development of a supervision ecosystem (that tracks legal activities and may also assist in tracking illegal activities) and promote a formal tax base.

However, challenges remain:

- The government is wary that regulation will provide legitimacy to "what is currently ambiguous," and may lead to further rise in its valuation and end up contributing "to the investment bubble".
- A currency that is not based on any real economic activity, unlike a sovereign currency whose value is based on the relative value of a tradeable basket of goods and services, cannot prima facie inspire much comfort.
- Bitcoin's value, astronomical even now at about \$8,300 but much below January 2018's stratospheric levels, is based on demand for a fixed supply of Bitcoins in the future it cannot exceed 21 million in number, of which 18 million has already been mined.
- Cryptos are feared not just for their sheer speculative propensities, but also for their capacity to undermine sovereign currencies (the latter is an exaggerated apprehension).
- Virtual currency is being traded anonymously over the Internet and used for a host of anti-national and illegal activities, from terror funding to illicit trade of arms and drugs and so on.
- The online use of this currency, was without any border restrictions or geographical constraints, resulting in danger to the integrity and sovereignty of the nation.
- However, it does not make sense to go overboard and criminalise merely adventurous crypto speculators. There are no official or other data available that point towards misuse of cryptocurrencies for illegal ends

Measures needed:

- Governments the world over have banned cryptocurrencies as a medium of exchange, and India is no exception.
- Yet in India, an estimated 30 lakh Bitcoins are reportedly in circulation. From a value of a little over ₹60,000 at the start of 2017, the Bitcoin now commands a value of nearly ₹6 lakh, with a global market cap of \$10.2 trillion. Cryptos are recognised in the US as an asset class.

- Firms like Paypal, Uber, Visa and Mastercard have all signed up as part of the consortium to control it. Each has invested \$10 million.
- Criminalising possession of cryptocurrencies will impact such investments.
- Bankers and investors now consider the cryptocurrency market at par with derivatives. The NYSE plans Bitcoin futures through a platform called **Bakkt**.

Conclusion:

- Underlying the crypto movement is a libertarian belief: Cryptos are an alternative asset to fiat currencies; controlled by none, they cannot be manipulated by governments with vested interests.
- Legalising the cryptomarket can help beneficiaries emerge from the shadows and make productive investments in an economy witnessing a digital transformation.
- Crypto conduct calls for regulation, but not outright criminalisation.

Topic– Inclusive growth and issues arising from it.

Q) India aspires to become \$5 trillion economy by 2024. What measures needs to be taken by both government and private-corporations to achieve this target ? Discuss the long term impact of unsustainable and non-inclusive growth on Indian society. (250 words)

The hindu

Introduction:

- The President of India spoke of India becoming a “Five Trillion Dollar” economy, last month. It was reiterated by the Prime Minister and was even discussed in the NITI Aayog Governing Council meet.
- India is, currently, a \$2.8 trillion economy; to reach the \$5 trillion mark by 2024, the economy would require nominal growth in dollar terms of over 12% a year. To reach \$ 5 Trillion, we need to shift our perspective from policy to projects.

Body:

Measures needed: The Government and the Private sector must work together to bring about the following measures in different sectors:

Agricultural sector:

- Encouraging public and private investments to develop infrastructure like cold chains;
- Special attention for north-eastern, eastern and rain-fed states for augmenting scope of access to institutional credit;
- Rationalisation and targeting of input subsidies towards small and marginal farmers.
- Reform in land leasing laws to promote land consolidation and contract farming.
- Accelerating the pace of public investment in agriculture and ensure greater efficiency in capital use.

Manufacturing Sector:

- A three-pillar strategy to achieve required expansion of output — focus on existing high impact and emerging sectors as well as MSMEs.
- In the defence sector, there is a need to identify key components and systems and encourage global leaders to set up manufacturing base in India by offering limited period incentives.
- Ensure incentives result in technology/process transfer.
- Where applicable, leverage Government purchases (Offset Policy), particularly for technology transfer; and ensure high-quality anchor investors capable of spurring growth of associated suppliers (including MSMEs) and offer limited period incentives to anchors, if required.
- To boost electronics manufacturing, the government should consider offering additional fiscal incentives such as a limited-period tax holiday to players investing more than an identified threshold of investment.
- Similarly for the auto and auto-components sector, encouragement of global leaders for the identified components to set up manufacturing bases, and incentivising players willing to invest more than a threshold in identified areas.
- Measures to boost manufacturing in other areas including aeronautical, space, garments, organic/ayurvedic products besides emerging areas such as biotechnology, electric mobility, unmanned aerial vehicles, medical devices, robotics and chemicals.
- For micro, small and medium enterprises, there is a need to improve access to funding by way of development of SME credit risk databases, SME credit rating, and creation of community-based funds.

Services sector:

- There is a need for focus on champion services sectors like IT, tourism, medical value travel and legal would be required to achieve the expansion of the services sector output and concerted efforts need to be made to increase exports.
- Improving rail connectivity and seamless connectivity to major attractions.
- Facilitating visa regime for medical travel.
- Allowing expatriate professional to perform surgeries in identified hospitals
- E-commerce policy and regulatory framework for logistics segment.
- To promote growth of accounting and financial services, there is a need to pitch for promoting FDI in domestic accounting and auditing sector, transparent regulatory framework, and easing restriction on client base in the accounting and auditing sector.

- To push audio visual services, measures like exploring introduction of insurance in the film industry, promoting private investments in film schools, exploring franchise business models to exploit film franchise, and promoting gaming industry value chains.
- The scope for expansion into advisory, arbitration and mediation services is large and unexplored.
- A clear roadmap for domestic reforms in the sector, liberalisation and promotion of arbitration and mediation services must be developed
- For the education sector, allowing foreign universities to set up campuses in India, easy visa regime for students and education service providers, removing regulatory bottlenecks, providing recognition of online degrees and setting up appropriate evaluation techniques for online courses

Other measures:

- Select sectoral initiatives can be converted into 100 projects.
- Each to be led by a competent leader with proven skills.
- They must report to the PM.
- The regular bureaucracy would facilitate the job of the project leader, who will be free to choose her team.
- States need to recognise their core competence and aim to increase their economy by 2-2.5 times, which is roughly the size of the current deficit.

The long term impact of unsustainable and non-inclusive growth on Indian society:

- An economy, whatever its size, cannot be meaningfully evaluated independently of the extent of presence in it of natural capital.
- Till now, by referring to the imperative for growth, to eradicate poverty, any effort to conserve nature has not just been ignored but treated with derision, by both right and left.
- Two-thirds of the world's most polluted cities are in India, when we accept less than a fifth of its population.
- Air pollution shortens lives and lowers productivity, reducing the capacity to earn a living when alive.
- The poor are the most affected as they cannot afford to live in gated communities that somehow manage to commandeer scarce natural resources. Some part of environmental depletion in India is due to the pursuit of unbridled growth.
- Gender inequality manifested as women having less opportunity in life is not going to go away with a re-distribution of income along class lines or across social groupings.

Way forward:

- India needs to carry out the crucial internal reforms that will allow it to be a productive international player and to take on the leadership roles that so many people across the world hope that it will.
- Any improvement in the life of the majority would require a re-alignment of the growth process so that it is less damaging.
- This would very likely require that we have slower growth but the process can be configured to channel more of it towards poorer groups.
- India could and should aspire to double-digit growth. Without sustained growth at that all levels it has little hope of employing the roughly one million young people who join its workforce every month.
- And unless it takes advantage of its current, favourable demographics it is never likely to emerge as an upper-middle-income economy with a prosperous and thriving middle class.

Q) By considering India's socio-economic conditions into account, how do you define Inclusive Growth ? Discuss how core components of Inclusive growth would help to transform India into New India ? (250 words)

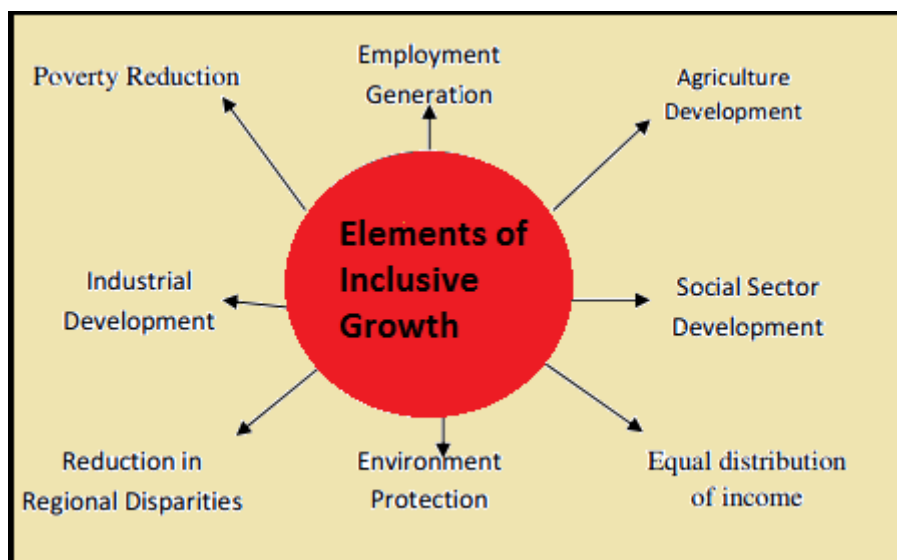

Reference

Introduction:

- The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as well. Inclusiveness is a multi-dimensional concept.
- Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty

**Body:**

- The Twelfth Five Year Plan of the erstwhile Planning Commission highlighted the desirability towards inclusive growth.
- The Plan highlights the objectives of inclusive growth as the following: Inclusive growth should result in lower incidence of poverty, broad-based and significant improvement in health outcomes, universal access for children to school, increased access to higher education and improved standards of education, including skill development.
- It should also be reflected in better opportunities for both wage employment and livelihood, and an improvement in the provision of basic amenities like water, electricity, roads, sanitation, and housing. Particular attention needs to be paid to the needs of the SC/ST and OBC population (Planning Commission 2011).

- Economic policies that encompass growth with equity and social policies that improve the capabilities of the poor and redistributive income policies are vital to reduce poverty and income inequality.
- There is need to spread health and education far more widely amidst the population.
- Economic growth while reducing poverty does not ensure equitable income distribution. The initial conditions of land ownership, education and health and social stratification have an important bearing on the impact of growth on the equitable distribution of incomes.
- Interventionist policies that redistribute resources or entitlements have an important impact on the extent of equity in incomes that is achieved. Improvements in literacy and education reduce inequality of incomes. Public expenditure on these is very important and therefore government revenues must be adequate to enable the fiscal space for such expenditure.
- The manner of raising tax revenue could also be important in reducing inequality. Progressive income tax systems, including recurrent property taxes, high taxes on luxury expenditure of the affluent, capital gains taxes and death duties would enable better income distribution by reducing incomes of the rich and enabling policy interventions that enhance the entitlements of the poor.
- Diversification of agriculture is necessary as without the development of this sector poverty in India cannot be tackled and income inequality cannot reduce.

Steps taken by the government for Inclusive Growth:

The government has realized the importance of inclusive growth and has taken steps accordingly. Some of the steps taken by the government are:

- Sarva Shiksha Abhiyaan
- Right to Education
- Midday meal scheme
- MNREGA
- Housing for All
- Pradhan Mantri Gram Sadak Yojana
- Pradhan Mantri Jan Dhan Yojana
- National Social Assistance Programme
- National Health Mission
- Rashtriya Swasthya Suraksha Yojana

- Pradhan Mantri Jeevan Jyothi Bhima Yojana
- Skill India, Make in India and Digital India
- Right to Information
- Other initiatives like Payment Banks, Small Finance Banks.

Conclusion:

- Inclusive growth is of vital importance to fight inequality in all aspects and promote holistic development of individuals in the country.
- Inclusive growth is necessary for the sustainable and holistic development of all sections of the society. For economic, social and political empowerment of its citizens, the core components of the Inclusive growth must be tackled.

INSIGHTSIAS
SIMPLIFYING IAS EXAM
PREPARATION

Topic: Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

Q) Discuss how has science improved agriculture in India? With the farm sector facing headwinds what structural reforms do you think Indian agriculture requires? Elucidate. (250 words)

Livemint

Why this question:

The question is straightforward and is about discussing the role played by science in improving agriculture and the need for structural reforms in Indian agriculture system.

Demand of the question:

The answer must discuss the role of science and technology in agricultural improvement along with need for structural reforms to move into Agriculture 2.0.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction

Start with facts/data depicting significance of agriculture to Indian economy.

Body

One can have the following points in the answer:

Economic Growth: A good transportation system is an important selling point to communities that desire to attract development that provides for employment and growth of a city. If transport costs due to congestion increase, goods and services produced within that city tend to increase in costs thus losing competitiveness in international markets. Efficient transportation access is therefore a very important consideration as it has a direct impact on sound and sustainable economic growth and productivity. The cost of congestion in the Western Province of Sri Lanka is over Rs 20,000 million per year (around 2 percent of Regional GDP). This includes the cost of productive time and wastage of fuel.

Quality-of-Life: To some people, congested highways are a symptom of deteriorating quality-of-life-in a community. The amount of time that is spent on commuting to and from work is also in reality, time that is taken away from social interactions or pursuit of activities that have a personal value and satisfaction.

First explain the conditions of Indian agriculture, the problems associated, issues and concerns related to structural reforms such as – market, farm incentives, diversification etc. Then move on to explain how the issues can be addressed. Suggest way forward, take hints from the article.

Conclusion

Conclude with significance of structural reforms required and the role played by science in improvising agriculture systems of India.

Introduction:

- Agriculture has always been a lifeline for India. Even though with age, India has made a mark in various spheres and has progressed in the manufacturing sector by leaps and bounds, but agriculture still remains one of the key drivers of the economy.
- Worldwide, India ranks second in farm output and accounts for about 50% of the country's workforce. Federal policy think tank NITI Aayog, chaired by Prime Minister recently decided to set up a task force of state chief ministers and central ministers to prepare a blueprint for structural reforms in agriculture

Body:

Science and Agriculture:

- The real success of scientific farming and use of various technologies in agriculture can be attributed to the Green Revolution. In 1960s when India was grappling with frequent droughts, Green Revolution came as a God's blessing.
- The golden period in the agriculture sector, facilitated in increasing crop yields by manifolds. Improved agronomic technology allowed India to overcome poor agricultural productivity.

- A crucial aspect to the success of the **Green Revolution in India** was the various scientific technologies developed to facilitate more yields. **New farming irrigation methods such as drip irrigation, stronger and more resistant pesticides, more efficient fertilizers, and newly developed seeds helped in proficient crop growth.**
- **Krishi Vigyan Kendras (KVKs)** are the frontline agricultural extension center funded by the Indian Council of Agricultural Research (ICAR). The KVKs focus on training and education of farmers, rural youth, on field demonstration of new and improved farming techniques etc.
- The term “**evergreen revolution**”, coined by agricultural scientist Dr. M. S. Swaminathan, kept India away from large scale import of food. At that time, technology, basically digital in character, like **Remote Sensing, Geographical Information Systems (GIS), Global Positioning System (GPS) and Geo-infomatics** were not available.
- With the country developing the indigenous **Indian Remote Sensing (IRS) satellite program**, the technology started to support the national economy in the areas of agriculture, water resources, forestry and ecology, geology, watersheds, marine fisheries and coastal management.
- In 2000's, the concept of **e-farming or e-agriculture also referred as ICT in agriculture**. E-agriculture focused on the enhancement of agricultural and rural development through improved information and communication processes.
- This involved conceptualizing, designing, developing, evaluating and application of innovative ways to use information and communication technologies (ICTs) in the rural domain, with a primary focus on agriculture.
- During this time India had also started to realise the worth of **geospatial technology** in boosting its economic growth by using the technology in various fields.

However, after nearly four decades into the post green revolution period, the country still grapples with crisis each year in trying to meet the increasing demand for food by its people. **Structural reforms needed** are:

- **Credit, finance and Insurance:**
 - Raising the MSP, price deficiency payments or income support schemes can only be a partial solution to the problem of providing remunerative returns to farmers.
 - A **functional institutional credit system** which is accessible and accountable to all cultivators.
 - This covers not only land-owning farmers but also sharecroppers, tenants, adivasi and women farmers, and animal-rearers.
 - Credit products for agriculture need to be tailor-made based on cropping and rain cycle, specific to a particular region. The regional offices of commercial banks should contribute in this exercise. Registration of all cultivators and providing Kisan credit cards.
 - The period of crop loan should be extendable to four years, given that, on average, every second or third year the spatial distribution of rain pattern is erratic in India.
- **Land holdings:**
 - The average size of farm holdings **declined from 2.3 hectares in 1970-71 to 1.08 hectares in 2015-16.**
 - Policies for land consolidation along with land development activities in order to tackle the challenge of the low average size of holdings.
 - Farmers can **voluntarily come together** and pool land to gain the benefits of size. Through consolidation, farmers can reap the economies of scale both in input procurement and output marketing.
- **Input Costs:**
 - It is more important to make agriculture sustainable by reducing input costs of seeds, fertilizers and other inputs.
 - Investment in infrastructure and research and development are needed.
 - There is a need for collaboration of **industry-academia** for coming out with cost-effective solutions to agrarian distress.
 - There is a need to make a shift from rice and wheat-centric policies to millets, pulses, fruits, vegetables, livestock and fish.
- **Remunerative Prices:**
 - Extending reach of minimum support price which has been dedicated to few crops and in a narrow geographical area is important.
 - Set up of Futures and Trade markets, tie up of farmer and private companies for procurement should be looked into as alternative methods against distress sale.

- **Agro- Produce Marketing and Processing:**
 - The creation of a **competitive, stable and unified national market** is needed for farmers to get better prices.
 - For better price for farmers, agriculture has to go beyond farming and **develop a value chain comprising farming, wholesaling, warehousing, logistics, processing and retailing.**
 - The agro-processing industry and warehousing needs to expand so that agricultural produce can be stored when prices plunge.
 - Promoting viable farmer collectives to act as a “collective voice of marginal and small farmers”.
 - Legislations on the basis of NITI Aayog’s new model law — **Agricultural Produce and Livestock Marketing (Promotion and Facilitating) Act (APLM)** should be enacted in all states.
 - A sustainable solution is market reforms to enable better price discovery combined with long-term trade policies favourable to exports.
- **Technology:**
 - Use water-use efficient technologies that can improve significantly the produce like drip irrigation and sprinkler irrigation.
 - Precision agriculture, GM Crops should be encouraged drought prone areas.
 - Space technology and Mobiles should act as “Eyes and Ears” of the farmers to assist in farming.
- **Distress Management:**
 - Establish farmers’ distress and disaster relief commissions at the national and State levels, based on the model of Kerala Farmers’ Debt Relief Commission.

Conclusion:

- Although Science and Technology did help improve the situation of Agriculture but the farmer income dropped consistently due to a variety of reasons.
- There is a need for implementation of the structural reforms and recommendations of various commissions to realise the **goal of doubling of farmer’s income by 2022.**

Q) Other than pest resistance, what are the prospects for which genetically engineered plants should be cultivated? Discuss the concerns and challenges associated with their cultivation also suggest way forward. (250 words)

The hindu

Why this question:

Recently Farmer groups have alleged that Bt brinjal, a genetically modified variety, is being cultivated illegally in Haryana. India banned Bt brinjal in 2010. The debate around BT brinjal started in 2000 when Mahyco (Maharashtra Hybrid Seeds Co) came up with a GM brinjal. Seeds were exported to Bangladesh and Philippines in 2006, as the civil society resisted field trials in India.

Key demand of the question:

The answer must discuss the prospects, challenges and concerns associated with cultivation of Bt Brinjal.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on the current context of the question.

Body:

Discussion should include the following:

What are Bt crops? What are their prospects?

Issues and concerns associated to their cultivation?

Explain the effect of it on agriculture system; farmer’s income etc. Provide for pros and cons and draw a balanced opinion.

Conclusion:

Conclude with a balanced opinion as to what needs to be done

**Introduction:**

- Genetically engineered crops (GM crops, or biotech crops) are plants used in agriculture, the DNA of which has been modified using genetic engineering methods. In most cases, the aim is to introduce a new trait to the plant which does not occur naturally in the species.
- Examples in food crops include resistance to certain pests, diseases, or environmental conditions, reduction of spoilage, or resistance to chemical treatments (e.g. resistance to a herbicide), or improving the nutrient profile of the crop. Examples in non-food crops include production of pharmaceutical agents, biofuels, and other industrially useful goods, as well as for bioremediation

Body:**Advantages of GM Crops other than pest resistance:**

- **Food Security:** Given the increased growth of global population and increased urbanisation, GM crops offer one of the promising solutions to meet the world's food security needs.
- **Improved Stress Tolerance:** Genes that give greater tolerance of stress, such as drought, low temperatures or salt in the soil, can also be inserted into crops. This can extend their range and open up new areas for food production.
- **Faster Growth:** Crops can be altered to make them grow faster, so that they can be cultivated and harvested in areas with shorter growing seasons. This again can extend the range of a food crop into new areas or perhaps allow two harvests in areas where only one is currently practical.
- **More Nutritious Crops:** Plants and animals can be engineered to produce larger amounts of essential vitamins and minerals, such as iron, helping to solve nutrition problems in some parts of the world. They can also be altered to change the amounts of protein, carbohydrates, and saturated and unsaturated fats that they contain. This could lead to the production of foods designed specifically for a healthy diet for all consumers.
- **Production of Medicines and Vaccines by Crops:** It may be possible to have plants and animals produce useful medicines and even vaccines, so that prevention and treatment of human diseases in some places can be achieved cheaply and efficiently through the diet.
- **Resistance to Herbicides:** Crops can be modified to be resistant to specific herbicides, making it much easier to control troublesome weeds. Farmers can simply apply the weed killer to a crop field, killing the unwanted plants and leaving the food crop unaffected. For example, GM oilseed rapeseed – the source of canola oil – is resistant to one chemical that's widely used to control weeds.
- **Better Tasting Foods:** Foods can be engineered to taste better, which could encourage people to eat more healthy foods that are currently not popular because of their taste, such as broccoli and spinach. It may be possible to insert genes that produce more or different flavours as well.
- **Economic benefits:** GM crops can increase yield and thus income. Genetically modified foods have a longer shelf life. This improves how long they last and stay fresh during transportation and storage.

Concerns/Challenges associated with GM Crops:

- **Human Health Risks:**
 - Potential impact on human health including allergens and transfer of antibiotic resistance markers.
 - The impact of growing GM crops poses risks to human health as their resistance to antibiotics can turn medicines ineffective and may result in the formation of new toxins and allergens.
 - Toxins produced by GM crops can not only affect non target organisms but also pose the danger of unintentionally introducing allergens and other anti-nutrition factors in foods.
- **Bio safety concerns:**
 - They can **reduce species diversity**.
 - For example, Insect-resistant plants might harm insects that are not their intended target and thus result in destruction of that particular species.
 - Cross-pollination in GM crops paves the way for herbicide-resistant super weeds that can further threaten the sustenance of other crops and pests because of its uncontrolled growth
 - GM technology could also allow the transfer of genes from one crop to another, creating "**super weeds**", which will be immune to common control methods.
 - Viral genes added to crops to confer resistance might be transferred to other viral pathogens, which can lead to new and more virulent virus strains.
- **Implications on Farmers and Consumers:**
 - Critics claim that **patent laws give developers** of the GM crops a **dangerous degree of control over the food supply**. The concern is over domination of world food production by a few companies

- **National Institute of Agricultural Economics and Policy Research's** anticipation that Bt brinjal's high yield and increased shelf life will benefit consumers and farmers owing to cut in retail price of brinjals ignores the scenario that companies might charge premium prices for Bt brinjal seeds, in which case farmers may not benefit at all.
- **Economic Concerns:**
 - Introduction of a GM crop to market is a **lengthy and costly process**. It has not resulted in high yields as promised.
 - For instance, the highest yields in mustard are from the five countries which do not grow GM mustard — U.K., France, Poland, Germany and Czech Republic — and not from the GM-growing U.S. or Canada.
- **Inefficient Regulatory system:**
 - Seeing the lapses in the regulatory system and irregularities in the assessment of Bt brinjal (in terms of labelling and unapproved and illegal sowing of GM crops) Parliamentary Standing Committee on Agriculture and the Committee on Science & Technology, Environment and Forests recommended:
 - A thorough probe by a team of eminent independent scientists and environmentalists for commercialization of GM crops.
 - Endorsed labelling GM foods to protect a consumer's right to know.
- **Ethical Concerns:**
 - Violation of natural organisms' intrinsic values by mixing among species.
 - There have also been objections to consuming animal genes in plants

Way Forward:

- The government must take decisions on GM technologies on the basis of scientific evidence.
- Need to start cultivating an environment of openness and transparency to allay genuine fears
- The government should adopt a participatory approach to bring together all stakeholders to develop regulatory protocols that restore trust in the process.
- There is a significant uncertainty over their safety, so precautionary principle is that country shall wait till a broader scientific consensus is achieved.
- Need for better policy, pricing and to rationalize the input costs
- GEAC needs to be a transparent body. it should put it in the public domain that on what grounds it has approved GM mustard
- There has to be strong liability laws if there are any environmental hazards or if something goes wrong in future
- Agriculture is a state subject therefore, it is important for the Centre to take into consideration the views of State Governments as well.
- The Food and Agriculture Organization (FAO) has rightly pointed out in 2004, "Science cannot declare any technology completely risk free. Genetically engineered crops can reduce some environmental risks associated with conventional agriculture, but will also introduce new challenges that must be addressed".

Q) Write a short note on integrated pest management (IPM) also discuss the constraints involved in the same. (250 words)

Reference

Why this question:

The question is straightforward on the concept of IPM.

Key demand of the question:

The answer must discuss in detail the IPM system and the hurdles/challenges involved in practicing it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on the concept of IPM.

Body:

Discussion should include the following:

What is integrated pest management system? – IPM is a managed pest management system that: eliminates or mitigates economic and health damage caused by pests; minimizes the use of pesticides and the risk to human health and the environment associated with pesticide applications.

What are some methods used in IPM? – methods used in IPM include one or a combination of the following: Cultural control (crop rotation, use of locally adapted or pest resistant/tolerant varieties, sanitation, manipulating planting/harvest dates to avoid pests)

Provide for examples.

Discuss specific challenges involved.

Conclusion:

Conclude with way forward.

Introduction:

- Integrated Pest Management (IPM) is an eco-friendly approach which aims at keeping pest population at below economic threshold levels by employing all available alternate pest control methods and techniques such as cultural, mechanical and biological with emphasis on use of bio-pesticides and pesticides of plant origin like Neem formulations.
- The use of chemical pesticides is advised as a measure of last resort when pest population in the crop crosses economic threshold levels (ETL). IPM is aimed at suppression of pest population below economic threshold level through the adoption of feasible and affordable Good Agricultural Practices and causing least disturbance to the eco system and environment.

Body:

- As per United Nation's **Food' and Agriculture Organization (FAO)**, IPM is defined as: "The careful consideration of all available pest control technique's and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels that are economically justified and reduce or minimize risks to human health and the environment.
- IPM emphasizes the growth of a healthy crop with the' least possible disruption to agro-ecosystems and encourages natural pest control mechanism".

Constraints involved in IPM:

- More involvement in the technicalities of the method
 - Individual farmers and all those involved in IPM have to be educated about their options in the various methods available, which often take time.
- Time and energy consuming
 - Application of IPM takes time and has to be closely monitored, as the practice of IPM has many different methods integrated in order to provide the most effective pest control methods.
- Different pests have different control methods, and it is necessary to monitor which methods are the best for specific pests.
- Initially complicated decision-making.
- Crop monitoring results that can be difficult to interpret.
- Lack of market rewards for IPM grown product.
- Limited market tolerance to blemishes

ICAR-National Research Centre for Integrated Pest Management (NCIPM), India was established in February, 1988 to cater to the plant protection needs of different agro-ecological zones of the country.

Conclusion:

- The increasing cost of plant protection and accelerating pest incidents make agriculture a risky and less profitable enterprise. At the same time the toxic materials generated from chemical farming pollute the environment and harm consumers' and farmers' health.
- Additionally, from the viewpoint of sustainability, attaining growth while maintaining the natural capital intact, IPM is superior compared to conventional farming. It should, therefore be appreciated and encouraged to a greater extent both by governments and NGOs'.

Extra information: Case Study: integrated pest management in Cotton at Ashta village, Nanded district (Marathwada region), Maharashtra.

The general impacts of the Ashta IPM are as below:

- Conservation and enhancement in the activity of the natural enemies (predators and parasites)
- Reduction in the quantity of chemical insecticides used
- Environmental safety as evident by increase in the number of bird population in the crop.
- Compensatory yields and higher net returns

Q) Discuss the major important cropping patterns of India along with the factors affecting it. (250 words)

Indian geography by Majid Hussain

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

The answer must discuss mainly the factors affecting important cropping patterns and the key cropping patterns practiced in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what is a cropping pattern.

Body:

The answer is straightforward and direct in approach, one has to discuss the major cropping patterns of the country. Cropping Pattern mean the proportion of area under different crops at a point of time, changes in this distribution overtime and factors determining these changes. Cropping pattern in India is determined mainly by rainfall, climate, temperature and soil type. Then explain in detail the factors affecting it – natural and man-made.

Conclusion:

Conclude with significance.

Introduction:

- Cropping pattern is a dynamic concept because it changes over space and time. It can be defined as the proportion of area under various crops at a point of time.
- In other words, it is a yearly sequence and spatial arrangement of sowing and fallow on a given area. In India, the cropping pattern determined by rainfall, climate, temperature, soil type and technology.

Body:

Major important cropping patterns of India:

- **Rabi crops** are sown in winter from October to December and harvested in summer from April to June. Some of the important Rabi crops are wheat, barley, peas, gram and mustard. Though, these crops are grown in large parts of India, states from the north and north-western parts such as Punjab, Haryana, Himachal Pradesh, Jammu and Kashmir, Uttarakhand and Uttar Pradesh are important for the production of wheat and other rabi crops. Availability of precipitation during winter months due to the western temperate cyclones helps in the success of these crops. However, the success of the green revolution in Punjab, Haryana, western Uttar Pradesh and parts of Rajasthan has also been an important factor in the growth of the above-mentioned rabi crops.
- **Kharif crops** are grown with the onset of monsoon in different parts of the country and these are harvested in September-October. Important crops grown during this season are paddy, maize, jowar, bajra, tur (arhar), moong, urad, cotton, jute, groundnut and soyabean. Some of the most important rice-growing regions are Assam, West Bengal, coastal regions of Odisha, Andhra Pradesh, Telangana, Tamil Nadu, Kerala and Maharashtra, particularly the (Konkan coast) along with Uttar Pradesh and Bihar. Recently, paddy has also become an important crop of Punjab and Haryana. In states like Assam, West Bengal and Odisha, three crops of paddy are grown in a year. These are Aus, Aman and Boro.
- In between the Rabi and the kharif seasons, there is a short season during the summer months known as the **Zaid season**. Some of the crops produced during 'zaid' are watermelon, muskmelon, cucumber, vegetables and fodder crops. Sugarcane takes almost a year to grow.

Some of the most commonly followed crop patterns:

- **Rice-Wheat:** UP, Punjab, Haryana, Bihar, West Bengal, Madhya Pradesh.
- **Rice-Rice:** Irrigated and Humid coastal system of Orissa, Tamil Nadu, Andhra Pradesh, Karnataka and Kerala.
- **Rice- Groundnut:** Tamil Nadu, Andhra Pradesh, Karnataka, Orissa and Maharashtra
- **Rice-Pulses:** Chhattisgarh, Orissa and Bihar.
- **Maize-Wheat:** UP, Rajasthan, MP and Bihar.

- **Sugarcane-Wheat:** UP, Punjab and Haryana accounts for 68% of the area under sugarcane. The other states which cover the crops are; Karnataka and MP.
- **Cotton-Wheat:** Punjab, Haryana, West UP, Andhra Pradesh, Karnataka, Tamil Nadu.
- **Soya bean-Wheat:** Maharashtra, MP and Rajasthan
- **Legume Based Cropping Systems (Pulses-Oilseeds):** MP, Gujarat, Maharashtra, Andhra Pradesh and Karnataka.

Factors affecting Cropping pattern: Cropping pattern of any region depends upon many factors

- **Physical and Technical Factors:**
 - These include the physical characteristic as soil, climate, weather rainfall etc. In the dry regions where the rainfall is scanty and where there is high uncertainty of monsoons, the dependence is on jowar and bajra. Water logging areas cultivate rice.
 - Cropping pattern also depend upon irrigation facilities. Where ever water is available, not only can a different crop be grown but even double or triple cropping will be possible.
- **Economic Factors:**
 - Economic motivation is the most important in determining the cropping pattern of the country. Among the various economic factors affecting crop pattern, the following are important:
 - **Price and Income Maximisation:** Price variations exert an important influence on acreage shifts. The variation in the inter-crop prices led to shifts in acreage as between the crops.
 - **Farm Size:** There is a relationship between the farm size and the cropping pattern. The small farmers are first interested in producing food grain for their requirements. Small holder therefore devotes relatively small acreage to cash crops than large holders.
 - **Insurance against risk:** The need to minimise the risk of crop failures not only explains diversification but also some specific features of crop patterns.
 - **Availability of Inputs:** Seeds, fertilizers, water storage, marketing, transport etc. also affect the cropping pattern.
 - **Tenure:** Under the crop sharing system, the landlord has a dominant voice in the choice of the cropping pattern and this helps in the adoption of income maximising crop adjustments.
- **Infrastructure facilities:**
 - Irrigation, transport, storage, trade and marketing, post-harvest handling and processing etc
- **Government Policies:**
 - The legislative and administrative policies of the government may also affect the cropping pattern. Food Crops Acts, Land Use Acts, intensive schemes for paddy, for cotton and oilseeds, subsidies affect the cropping pattern.
 - MSP – farmers shifting to wheat, rice
 - Green Revolution – skewed cropping pattern in Northern India towards wheat and rice from coarse cereals and pulses
- **Social factors**
 - Food habits also play a role – East and South India prefers rice as staple food while it is wheat in North India.

Conclusion:

- The cropping pattern in India has undergone significant changes over time. As the cultivated area remains more or less constant, the increased demand for food because of increase in population and urbanisation puts agricultural land under stress resulting in crop intensification and substitution of food crops with commercial crops.

Q) Discuss the role of IT in Agriculture and also explain what are the major challenges in the spread of e-technology to farmers. (250 words)

Reference

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

The answer must discuss the role played by IT in augmenting the agriculture system and as well explain the challenges faced in the spread of e-technology to farmers.

**Directive:**

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Begin with brief introduction by explaining the need for e-technology to farmers.

Body:

Discussion should include the following:

Role of IT in agriculture; as a tool for direct Agri productivity and as an indirect tool for empowering farmers.

Major challenges in the spread of e-technology to farmers – lack of literacy to understand the technology, gaps in infrastructure, reach, mobility and connectivity etc.

Explain in detail the associated hurdles.

Conclusion:

Conclude with way forward.

Introduction:

- Information Technology (IT) has long been viewed as having great potential for improving decision making in agriculture. IT has connected the world globally and is now changing our life style and social consciousness dynamically. In all phases of the agricultural industry, information technologies are vital to the management and success of a business. Agriculture has also been greatly influenced by IT.

Body:**Role of IT in Agriculture:**

In the context of agriculture, the potential of information technology (IT) can be assessed broadly under two heads:

- as a **tool for direct contribution to agricultural productivity**
- As an **indirect tool for empowering farmers to take informed and quality decisions which will have positive impact on the way agriculture and allied activities are conducted.**
- Precision farming, popular in developed countries, extensively uses IT to make direct contribution to agricultural productivity. The techniques of remote sensing using satellite technologies, geographical information systems, agronomy and soil sciences are used to increase the agricultural output. This approach is capital intensive and useful where large tracts of land are involved. Consequently it is more suitable for farming taken up on corporate lines.
- The indirect benefits of IT in empowering Indian farmer are significant and remains to be exploited. The Indian farmer urgently requires timely and reliable sources of information inputs for taking decisions.
- Access to technology is one of the most important enablers for smallholders to improve productivity sustainably. Innovative mechanisms for technology transfer are required to bring relevant tools, knowledge and knowhow to farmers.
- Market linkages are common weak points between the smallholders and formal supply chains. Intermediaries are required not only to aggregate production from small-scale growers, but also to provide support and services to ensure the quality and consistency of production.
- ICT applications can foster dissemination of information on technology, market demand and price information; weather, pest, and risk-management information, best practices to meet quality and certification standards.
- To bridge the information gap between the farmers and to build productive and competitive market, different ICT interventions support rural and under-developed markets to become efficient and productive.
- The rapid changes in the field of information technology make it possible to develop and disseminate required electronic services to rural India. The existing bottlenecks in undertaking the tasks need to be addressed immediately.

Challenges in spread of e-technology to farmers:**Mobile Connectivity:**

- Even the masses have access to mobile connectivity, but the potential of the handsets are not yet tapped. This is largely because of the content delivered is often not directly related to their livelihood and environment. Since they need localised news and information directly delivered in their language to meet their daily needs.
- Affordability is a key issue for many potential users. Not everyone can afford handsets; innovative business models adopted by the firms and handsets at low price tag which work for voice and sms based services.

- Other challenge in disseminating agriculture related information is dynamic nature of information. Farming is not so linear but requires constant inputs at every stage where new technological inputs provide better crop outputs.

Internet Connectivity:

- **Haphazard development:**
 - It is observed that some initiatives have already been made to provide IT based services to farmers. However, duplication of efforts are witnessed as most of the services revolve around limited subjects.
 - Keeping in view the giant task involved, it is necessary to form a coordination mechanism to strive for a concerted effort to support farming community in the country. Such a coordination agency may only have advisory powers.
- **User friendliness:**
 - The success of the strategy depends on the ease with which rural population can use the content.
 - This will require easy language, training to farmers and intuitive graphics based presentation.
- **Local languages:**
 - Regional language fonts and mechanisms for synchronisation of the content provides a challenge that needs to be met with careful planning
- **Restrictions:**
 - Information content based on remote sensing and geographical information systems can provide timely alerts to the farmers and also improve the efficiency of administration.
- **Power Supply:**
 - In most of the rural India, power supply is not available for long hours. This will reduce the usefulness of the intended services.
 - Since almost entire country receives sunshine for most part of the year, it is useful to explore solar power packs for UPS as well as for supply of power.
- **Connectivity:**
 - Despite the phenomenal progress made in the recent years, the connectivity to rural areas still requires to be improved.
 - Reliable connectivity is a prerequisite for a successful penetration of IT into rural areas.

Conclusion:

- The use of IT in agriculture has grown rapidly in the past few years. It is increasingly being used to help managers make better decisions.
- However, IT and the problem facing decision makers are constantly changing. Thus, future information systems for research purposes will be significantly different than current systems because of these changes. IT has been one of the most aspired fields in today's world. Integrating IT with agriculture will help any country to regulate its overall economy and trade.

Topic: Agriculture issues; Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Q) In India, a large part of the Agri supply chain ecosystem is either in the public sector, or strongly linked to it, do you think private investments in primary agriculture can prove to be a solution to make agriculture more sustainable for the country? Discuss. (250 words)

Reference

Why this question:

The article debates about the role of private investments in agriculture and the possible consequences of it.

Key demand of the question:

The answer must provide for a detailed analysis of possible impact that private investments would have on agriculture in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief background of the context in question.

Body:

Discussion should include the following:

First discuss the gaps in agriculture system of the country – infrastructural gaps, financial gaps, role of government etc.

Then move on to explain what effect would private investment have on India.

Discuss what can be the issues associated to increased private investments.

Link it to doubling of farmer's income and end with a positive note.

Conclusion:

Conclude with way forward.

Introduction:

- In India, a large part of the agri supply chain ecosystem is either in the public sector, or strongly linked to it. The huge scale at which it is done has many chinks in the armour. This has resulted in food quality issues, huge wastage of food, reduced remuneration to farmers and agrarian distress.

Body:

Role of Government:

- The Indian government attempts to insulate the cultivator from price fluctuations by procuring their produce at Minimum Support Prices (MSPs).
- The 7500+ Agricultural Procurement and Marketing Committee (APMC) mandis provide a marketplace for the transaction and the Food Corporation of India (FCI) plays the role of the buyer, storing the procured produce in the relevant warehousing corporation's warehouse.
- Ultimately, this gets distributed through the Public Distribution System (PDS) shops and reaches the consumer. For non-MSP crops, the producer is dependent on the traditional private channels to market her produce.
- Agriculture is a 'state subject' and a large part of investment as well as regulatory progress is happening at the state level.
- Till very recently, regulatory barriers had constrained the development of storage and processing infrastructure but measures like inclusion of agri-warehousing under priority sector lending by RBI, subsidy schemes, tax incentives and the Warehousing Act (which will promote negotiability of warehousing receipts) have helped private players take an active interest in the same.
- The Private Entrepreneur Guarantee Scheme is one such initiative to incentivize private investment for construction of warehouses by private entrepreneurs, with an FCI guarantee to hire them for 10 years, assuring a fair return on investment by the entrepreneur.

Challenges posed due to monopoly of Public sector:

- **Inefficient price signals:** The government has been buying almost one-third of all rice and wheat produced in India through the PDS system, but in other kinds of grains, fruits and vegetables (both being highly perishable), the role of the government is limited. This leads to MSPs being ineffective as both price signals and as insulators from the perspective of the larger agricultural population.
- **Limited reach of mandis:** Also, this procurement system has failed to cover the entire country evenly (back of the envelope calculation suggests that on an average, a farmer needs to travel 12 kms to reach the nearest mandi and more than 50 kms in NE India) while according to the recommendations by National Farmers Commission, availability of markets should be within a 5 km radius.
- **Too many intermediaries, information asymmetry:** The above mentioned problems have led to formation of long marketing channels, with multiple intermediaries, adding to the woes of the producers of perishable agri goods. These intermediaries have led to a cost inflation of ~250% (over the cost of production) and have exacerbated the existing information asymmetries in agriculture, especially for non-MSP crops.
- **Inadequate infrastructure for storage:** The Planning Commission has recently estimated the gap between agri-warehousing supply and demand at 35 mn MT. Currently, public sector agencies like the FCI, Central Warehousing Corporations (CWC) and the various State Warehousing Corporations (SWC) have a storage capacity of 71 mn MT, while the private sector has close to 25 mn MT. To put the scarcity in perspective, food grain stocks held only by the government was 80 mn MT last year (peak) according to the FCI annual report.
- **Skewed distribution of capacity:** Skewed distribution of this capacity is another issue, with North India having access to 60% of the total storage infrastructure. The Planning Commission has recently estimated the gap between agri-warehousing supply and demand at 35 mn MT.

- **Lack of cold storage infrastructure:** India's current cold storage capacity at 25 MT is barely sufficient for 10% of fruit and vegetables produced in the country.
- **Lack of collateral management options:** Collateral management refers to financing of agricultural goods stored at warehouses, and is estimated to be a ~Rs 3,500 cr opportunity by industry sources.

Private investments potential to improve the situation:

- **Comprehensive agriculture logistics solutions:** Private players that provide integrated post harvest management solutions have entered the space to fill these gaps. They could also provide collateral management and other value added services (quality testing, agri insurance, bulk procurement and rural retailing) to its clients.
- **Integrated cold chain solutions:** They could provide customized solutions for cold storage and refrigerated transportation across India for fresh and frozen commodities.
- **Contract Farming:** involved in contract farming and agro processing, working on improving income realizations for small farmers through yield improvements, productivity increases, and consistent produce pricing.
- **Alternate marketplaces:** By providing a way to bypass the long chain of intermediaries by directly connecting buyers and sellers of agricultural produce and allied services, via a web and mobile based information exchange platform.
- **Reducing the information asymmetry:** Riding on the high mobile penetration in rural India private players are working on the problem of information asymmetry for agricultural producers, by making personalized agricultural market information available to the farmers at minimal costs, through a mobile based service.
- **Innovative ICT tools for supply chain management:** A hosted web service for supply chain management, which can be accessed via basic mobile phones and web browsers, which makes it uniquely suitable for in rural markets. It is a configurable service which offers customers the ability to capture and share data in a simple, low-cost way, empowering them to make better logistics decisions.

Conclusion:

- These solutions could lead to better supply chain management in Indian agriculture, reducing inefficiencies and increasing farmer realizations, as well as curbing food waste. A co-ordinated effort with good policies bolstered by logistics of the private players can help in achieving the goal of doubling farmer's income by 2022.

Q) To tackle agrarian distress in a sustainable manner, direct income support to farmers needs to be complemented with reforms in Agriculture marketing and trade policies. Explain. (250 words)

Reference

Why this question:

The question is straightforward and must discuss the approach for sustainable agriculture and suggest solutions for tackling agrarian distress.

Key demand of the question:

The answer must discuss the role of Agri markets, physical infrastructure that needs to be supported along with direct income support to make agrarian distress

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Describe the conditions of agrarian distress.

Body:

The answer must emphasize on the methods of handling agrarian distress in a sustainable manner, one has to elaborate how income transfer alone can not be a fixed one-shot solution to the problems facing agriculture.

Conclusion:

Conclude with importance of having multi-pronged approach to address the distress.

Introduction:

- The **lack of remunerative prices** for the crops is one of the main reasons for Agrarian distress in India today. The various options like **Minimum Support Price** for about 25 crops, **Farm Loan Waiver** schemes undertaken by various state governments have failed to alleviate the problem.

- The NSSO Situation Assessment Survey of Agricultural Households (2013) shows that 52% of farming households are indebted, with rates as high as 89-92% in some States.

Body:

Direct Cash/Intervention Scheme: This involves the **Direct Benefit Transfer (DBT) of the cash to the farmers.**

- It can be enforced to include almost all the farmers who have access to formal banking channels (Jan-Dhan Accounts).
- Provides financial help at proper time/ season and would also **spur the investment cycle in the farm economy.**
- Helps large as well as small farmers and can even be capped to limit unwarrantedly huge transfers to rich farmers.
- The corruption issue can be eliminated as farmers directly get the cash in their accounts.

Examples of Direct Intervention Schemes:

- **Pradhan Mantri Kisan Samman Nidhi** will provide assured income to small and marginal farmers. The amount will be transferred directly into their account in 3 equal instalments. With this decision, all land holding eligible farmer families (subject to the prevalent exclusion criteria) would avail of the benefits under this scheme. It would not only provide assured supplemental income to the most vulnerable farmer families, but would also meet their emergent needs especially before the harvest season.
- The Telangana government's income/investment support through the **Rythu Bandhu Scheme (RBS)**. Telangana started RBS in May 2018, whereby it gave Rs 4,000 per acre to every farmer. This transfer is made twice a year, coinciding with the two cropping seasons. By directly giving cash, the government aims to support the input purchases of farmers. The scheme is said to have reached almost 93 per cent of landowners.
- **Odisha** has launched the **KALIA scheme** that will provide Rs. 10,000 to about 3 million small and marginal farmers for the Rabi and kharif crops.
- **Jharkhand** has announced a Rs. 5,000-per-acre payment to 2.3 m medium and marginal farmers from the next financial year.
- **West Bengal** has announced two new schemes for farmers and farm labourers in the state that entail a payment of Rs.5,000 per acre every year in two instalments besides Rs.2 lakh to the kin of farmers who die due to any reason, including suicide.

However, the other problems like Rigid Market Structure, Middlemen issues, Poor infrastructure and logistics, Information Asymmetry, Government Policies also reveal that the Agricultural Marketing has remained a weak point. This has resulted in poor incomes to farmers despite good produce, gluts in the market leading to price crashes, high amount of food rotting and wastage.

Therefore, there is a need to improve the agricultural marketing too by taking up following measures:

- It is imperative to bring agriculture marketing into the Concurrent or Union list to benefit farmers. This will guarantee remunerative prices to farmers.
- The Committee on Doubling Farmers' Income under the chairmanship of Ashok Dalwai justifies the recommendation saying marketing has no boundaries; this **necessitates a pan-India operation** to meet the demand across the country.
- NITI Aayog's **model Agricultural Produce and Livestock Marketing Act** should be implemented by the states. Further the provisions like facilitating single-point levy of taxes, promoting direct interface between farmers and end-users, and give freedom to farmers to sell their produce to whomsoever and wherever they get better prices.
- e-NAM is a good step in this way. Budget 2018 announced developed **GRAMS** which would be integrated to the e-NAM Structure.
- Promoting warehouse receipts, agro-processing and exports. Warehouse receipts will help farmers defer their sale immediately post harvest, when prices are at their lowest level.
- This will require a consolidation of farm produce, which can be successfully done through farmer-producer organisations.
- Agro-processing and trade will require investment in developing infrastructure.
- Existing agri-export zones need to be revisited and strengthened in this changing scenario.
- States alone cannot revamp the agricultural marketing sector, primarily due to paucity of funds and technology.
- Private investment on a massive scale needs to be invited to upgrade and build large storage and warehousing systems that are climate resilient.

**Conclusion:**

- The agrarian distress is a result of combination of factors. Thus, the need of the hour is a multi-pronged approach tackling the structural issues. It is time to concede that **production and marketing** should march together in order to benefit farmers and consumers. A co-ordinated effort with good policies bolstered by logistics of the private players can help in achieving the goal of doubling farmer's income by 2022.

Q) Agrarian distress is majorly a result of low farm prices and low agricultural productivity. Suggest measures which could help in realizing the goal of doubling farmers' incomes by 2022. (250 words)

Reference**Why this question:**

The question is straightforward and is about discussing extent of agriculture distress.

Key demand of the question:

The answer must discuss the key factors causing the Agrarian distress, and about the demands of urgent policy attention.

Structure of the answer:**Introduction:**

In a few introductory lines discuss the current Agrarian distress facing India.

Body:

In brief discuss –

- The rising demand for farm loan waivers across states show the extent of agriculture distress.
- This agrarian distress demands urgent policy attention on the following lines:
 - raise productivity
 - reduce costs of cultivation by providing quality inputs at subsidised rates
 - provide remunerative prices following the recommendations of the Swaminathan Commission
 - ensure assured procurement of output
 - expand access to institutional credit
 - enhance public investment for infrastructural development
 - institute effective crop insurance systems
 - establish affordable scientific storage facilities and agro-processing industries for value addition etc.
- Suggest what should be the way forward.

Conclusion:

Conclude with what more needs to be done.

Introduction:

- Agrarian distress, in the present context, is mainly in terms of low agricultural prices and, consequently, poor farm incomes. Low productivity in agriculture and related supply side factors are equally important.
- An issue that is connected is the declining average size of farm holdings and the viability of this size for raising farm incomes.

Body:**The critical issues associated with Agricultural Marketing:**

- **Rigid Market Structure:**
 - Prevalence of APMC markets, trader cartels due to which low price for agri produce is offered specially due to bumper crop production.
- **Poor Infrastructure and Logistics:**
 - Lack of diffusion of adequate storage facilities lead to wastage. For instance farmers dump truckloads of vegetables on road.
 - **Food Parks projects** concentrated near to cities and poor maintenance leads to spoilage of the crops.
 - Cold storage units exist in less than one-tenth of the markets and grading facilities in less than one-third; electronic weigh-bridges are available only in a few markets.
- **Government Policies:**
 - The government continues to use old draconian measures, including stocking restrictions and bans on exports and futures trading, to even small increase in food prices. Such steps may bring temporary relief to consumers, but end up hurting farmers.

- **Pro-Consumer bias:**
 - In most years, for the majority of agri-products, the policymakers used restrictive export policies to keep domestic prices low. This showed the pro-consumer bias in the policy complex.
- **Middlemen troubles:**
 - As pointed out by Ramesh Chand, in Punjab, there are as many as 22,000 commission agents and innumerable middlemen in each market.
 - According to Ashok Gulati, former chairman of the Commission for Agricultural Costs and Prices, commission agents in Delhi charge exorbitant fees ranging from 6 per cent to 15 per cent.
- **Information Asymmetry:**
 - A bumper crop can pull down prices in wholesale markets. Price spikes after a poor crop are inevitably dealt with through cheap imports in a bid to protect consumers. The opposite is done less frequently. This is due to lack of information.
 - The bountiful rains of 2016 resulted in record farm output. Prices crashed. Farmers are reported to have not been able to even recover the cost for some crops.
 - The prospects of a good monsoon pushed up rural wages. The reality of rock bottom prices then destroyed profit margins.
- **Aggressive cultivation led to plunge in demand:**
 - Once prices have increased farmers cultivated the crop aggressively leading to plunging of prices.
 - Two years ago, garlic fetched an average Rs 60 per kg rate in Rajasthan's Kota mandi. Enthused by it, farmers in the Hadoti region planted more area, only to see prices halve last May.
 - Similar was the case for other vegetables. Example: Tomato, Toor Dal etc.
- **Farmers income remained low:**
 - India had record food production in 2017-18, but farmers' income remained low and stagnant.
 - According to Ashok Dalwai committee, farmer's income remained about 15-40% of consumer's price.
 - Studies conducted by the International Food Policy Research Institute and World Bank have confirmed this.

Government has set up many committees like **Swaminathan committee** and the recent **Ashok Dalwai committee** to give solutions to agrarian distress in India. The **measures that can help agrarian distress in the country are as follows:**

- **Credit, finance and Insurance:**
 - Raising the MSP, price deficiency payments or income support schemes can only be a partial solution to the problem of providing remunerative returns to farmers.
 - A **functional institutional credit system** which is accessible and accountable to all cultivators.
 - This covers not only land-owning farmers but also sharecroppers, tenants, adivasi and women farmers, and animal-rearers.
 - Credit products for agriculture need to be tailor-made based on cropping and rain cycle, specific to a particular region. The regional offices of commercial banks should contribute in this exercise. Registration of all cultivators and providing Kisan credit cards.
 - The period of crop loan should be extendable to four years, given that, on average, every second or third year the spatial distribution of rain pattern is erratic in India.
- **Land holdings:**
 - The average size of farm holdings **declined from 2.3 hectares in 1970-71 to 1.08 hectares in 2015-16**.
 - Policies for land consolidation along with land development activities in order to tackle the challenge of the low average size of holdings.
 - Farmers can **voluntarily come together** and pool land to gain the benefits of size. Through consolidation, farmers can reap the economies of scale both in input procurement and output marketing.
- **Input Costs:**
 - It is more important to make agriculture sustainable by reducing input costs of seeds, fertilizers and other inputs.
 - Investment in infrastructure and research and development are needed.
 - There is a need for collaboration of **industry-academia** for coming out with cost-effective solutions to agrarian distress.
 - There is a need to make a shift from rice and wheat-centric policies to millets, pulses, fruits, vegetables, livestock and fish.

- **Remunerative Prices:**
 - Extending reach of minimum support price which has been dedicated to few crops and in a narrow geographical area is important.
 - Set up of Futures and Trade markets, tie up of farmer and private companies for procurement should be looked into as alternative methods against distress sale.
- **Agro- Produce Marketing and Processing:**
 - The creation of a **competitive, stable and unified national market** is needed for farmers to get better prices.
 - For better price for farmers, agriculture has to go beyond farming and **develop a value chain comprising farming, wholesaling, warehousing, logistics, processing and retailing.**
 - The agro-processing industry and warehousing needs to expand so that agricultural produce can be stored when prices plunge.
 - Promoting viable farmer collectives to act as a “collective voice of marginal and small farmers”.
 - Legislations on the basis of NITI Aayog’s new model law — **Agricultural Produce and Livestock Marketing (Promotion and Facilitating) Act (APLM)** should be enacted in all states.
 - A sustainable solution is market reforms to enable better price discovery combined with long-term trade policies favourable to exports.
- **Technology:**
 - Use water-use efficient technologies that can improve significantly the produce like drip irrigation and sprinkler irrigation.
 - Precision agriculture, GM Crops should be encouraged drought prone areas.
 - Space technology and Mobiles should act as “Eyes and Ears” of the farmers to assist in farming.
- **Distress Management:**
 - Establish farmers’ distress and disaster relief commissions at the national and State levels, based on the model of **Kerala Farmers’ Debt Relief Commission.**

Conclusion:

- Farmers’ distress is due to low prices and low productivity. **Limited procurement, measures to improve low productivity, and consolidation of land holdings to gain the benefits of size, can help in reducing agrarian distress.** It is time to concede that **production and marketing** should march together in order to benefit farmers and consumers. Farmers need to be empowered to decide when, where, to whom and at what price to sell.

Q) What are the major reforms needed in Food Corporation of India to ensure food security in India? Do you think the recommendations of the Shanta Kumar Committee take us in that direction? (250 words)

[pib](#)

Why this question:

Union Minister of Consumer Affairs, Food and Public Distribution laid down the future roadmap for Food Corporation of India (FCI) recently, thus it is essential for us to analyse the major reforms needed in Food Corporation of India to ensure food security in India.

Key demand of the question:

The answer must analyse the major reforms needed in Food Corporation of India to ensure food security in India along with significance of Shanta Kumar committee.

Structure of the answer:

Introduction:

In a few lines state some the role played by FCI.

Body:

The answer must discuss the following:

Discuss the Key highlights of the roadmap:

- Primacy will be given to ensuring that the functioning of FCI is streamlined and fast paced as per recommendations of the Shanta Kumar Committee.
- 100 lakh ton silo storage capacity will be created in the country. For this, RITES has been assigned the task of changing the silo model and they will give their recommendations in 90 days to FCI.
- At present, there are 3 types of labourers in FCI namely Departmental, Daily Payment System (DPS) and No work no pay workers along with contractual labour. Government of India is

deliberating to finish the 3 different arrangements and bring all workers of FCI under a single, uniform system which will bring stability of tenure and secured wages for all.

- To improve the usage of Information Technology in FCI, a Human Resource Management System (HRMS) will be implemented, the work for which will begin in August, 2019 and will be completed by August 2020. This move will benefit 22,000 employees in 196 offices of FCI. Then move on to explaining the significance of recommendations made by Shanta Kumar committee.

Conclusion:

Conclude with way forward.

Introduction:

- Food Corporation of India (FCI) was formed in 1960's and was part of larger plan directed toward food security and self-sufficiency. Other major institution was CACP. These two institutions along with MSP regime and Public distribution system were expected to work in tandem. FCI's responsibility was to procure, Store and discharge grains as per policy of the government.
- Over the time, as in other cases these institutions too failed to adapt to changing circumstances such as changing demands of economy. As a result FCI now reels under chronic inefficiency through huge wastages, and storage cost of grains keeps on cumulating.

Body:

Reforms needed in FCI due to:

- **Issues with procurement:**
 - Open-ended Procurement: All incoming grains accepted even if buffer stock is filled creating a shortage in the open market.
 - The recent implementation of Nation food security act would only increase the quantum of procurement resulting in higher prices for grains.
 - The gap between required and existing storage capacity.
- **Issues with storage:**
 - Inadequate storage capacity with FCI.
 - Food grains rotting or damaging on the CAP or Cover & Plinth storage.
- **Issues with allocation of food grains:**
 - Inaccurate identification of beneficiaries.
 - Illicit Fair Price shops: The shop owners have created a large number of bogus cards or ghost cards(cards for nonexistent people) to sell food grains in the open market.
- **Issues with transportation:**
- Leakages in food grains distribution to be reduced as most leakages in PDS takes place in initial stages.

The government had set up a **six-member committee under Shanta Kumar** to suggest restructuring or unbundling of FCI to improve its financial management and operational efficiency in procurement, storage and distribution of food grains.

Important recommendations made:

- Reduce the number of beneficiaries under the Food Security Act—from the current 67 per cent to 40 per cent.
- Allow private players to procure and store food grains.
- Stop bonuses on minimum support price (MSP) paid by states to farmers, and adopt cash transfer system so that MSP and food subsidy amounts can be directly transferred to the accounts of farmers and food security beneficiaries.
- FCI should involve itself in full-fledged grains procurement only in those states which are poor in procurement. In the case of those states which are performing well, like Haryana, Punjab, Andhra Pradesh, Chhattisgarh, Madhya Pradesh and Odisha, the states should do the procurement.
- Abolishing levy rice: Under levy rice policy, government buys certain percentage of rice (varies from 25 to 75 per cent in states) from the mills compulsorily, which is called levy rice. Mills are allowed to sell only the remainder in the open market.
- Deregulate fertiliser sector and provide cash fertiliser subsidy of Rs 7,000 per hectare to farmers.
- Outsource of stocking of grains: The committee calls for setting up of negotiable warehouse receipt (NWR) system. In the new system, farmers can deposit their produce in these registered warehouses and get 80 per cent of the advance from bank against their produce on the basis of MSP.

- Clear and transparent liquidation policy for buffer stock: FCI should be given greater flexibility in doing business; it should offload surplus stock in open market or export, as per need.

Government has taken up few of the reforms as follows:

- **Aadhaar Linked and digitized ration cards:** This allows online entry and verification of beneficiary data. It also enables online tracking of monthly entitlements and off-take of foodgrains by beneficiaries.
- **Computerized Fair Price Shops:** FPS automated by installing 'Point of Sale' device to swap the ration card. It authenticates the beneficiaries and records the quantity of subsidized grains given to a family.
- **Direct Benefit Transfer:** Under the Direct Benefit Transfer scheme, cash is transferred to the beneficiaries' account in lieu of foodgrains subsidy component. They will be free to buy food grains from anywhere in the market. For taking up this model, pre-requisites for the States/UTs would be to complete digitization of beneficiary data and seed Aadhaar and bank account details of beneficiaries. It is estimated that cash transfers alone could save the exchequer Rs.30,000 crore every year.
- **Use of GPS technology:** Use of Global Positioning System (GPS) technology to track the movement of trucks carrying food grains from state depots to FPS which can help to prevent diversion.
- **SMS-based monitoring:** Allows monitoring by citizens so they can register their mobile numbers and send/receive SMS alerts during dispatch and arrival of TPDS commodities
- **Use of web-based citizens' portal:** Public Grievance Redressal Machineries, such as a toll-free number for call centers to register complaints or suggestions.

Government has come up with a **roadmap** with the following highlights:

- Primacy will be given to ensuring that the functioning of FCI is streamlined and fast paced as per recommendations of the Shanta Kumar Committee.
- 100 lakh ton silo storage capacity will be created in the country. For this, RITES has been assigned the task of changing the silo model and they will give their recommendations in 90 days to FCI.
- At present, there are 3 types of labourers in FCI namely Departmental, Daily Payment System (DPS) and No work no pay workers along with contractual labour. Government of India is deliberating to finish the 3 different arrangements and bring all workers of FCI under a single, uniform system which will bring stability of tenure and secured wages for all.
- To improve the usage of Information Technology in FCI, a Human Resource Management System (HRMS) will be implemented, the work for which will begin in August, 2019 and will be completed by August 2020. This move will benefit 22,000 employees in 196 offices of FCI.

Conclusion:

- The Committee recommendations however was criticized due to suggestions like limiting NFSA, cash subsidy, privatization of FCI despite suggesting useful reforms to reform FCI, PDS. A closer scrutiny in the recommendation is needed today in times of agricultural distress & drought prone years.

Q) What do you understand by agricultural development? Discuss the role played by NGOs in supporting farmers across the states for agricultural development. (250 words)

[The hindubusinessline](http://www.insightsonindia.com)

Why this question:

The article discusses a specific case study of How an NGO named AHIMSA has been supporting farmer-producer groups across States

Key demand of the question:

The answer must first discuss the concept of agricultural development and analyse the role played by NGOs in agricultural development of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few lines define the concept of agricultural development.

Body:

The answer must discuss the following:

- What do you understand by agricultural development?

- What way can civil societies catalyze agriculture development in India?
- Discuss the prevalent issues and challenges facing Indian agriculture.
- One can discuss a case study (say the case study of NGO AHIMSA) and explain how along with efforts of the government on the policy front, such multi stakeholders' approach is crucial to the development of agrarian scenario of the country.

Conclusion:

Conclude with way forward.

Introduction:

- Agriculture development means providing assistance to the crop producers with the help of various agricultural resources. Providing protection, assisting in the research sphere, employing latest techniques, controlling pests and facilitating diversity all fall within the purview of agriculture development.

Body:

Agriculture development includes the following:

- **Irrigation Facilities:** Crop productivity depends not only on the quality of input but also on the irrigation facilities. Therefore, canals, tube wells should be constructed to provide better irrigation facilities for the security of crops. Extensive flood control measures should be adopted to prevent the devastation caused by floods.
- **Institutional Credit:** To save the farmers from the clutches of moneylenders, adequate credit facilities should be made available at reasonable cheap rates in rural areas.
- **Proper Marketing Facilities:** Marketing infrastructure should be widened and strengthened to help the farmers to sell their products at better prices. There should be proper arrangements for unloading of the produce in the markets.
- **Supply of Quality Inputs:** The farmer in the country should be supplied with quality inputs at proper times and at controlled prices. To protect the farmers' exploitation, effective steps are needed to be taken to check the sale of adulterated fertilizers.
- **Transport Facilities:** To facilitate the farmers to produce new farm inputs and enable them to sell their product in markets, villages should be linked with mandies. It would help to raise their income which in turn stimulates the farmer's interest to adopt better farm technology with sufficient income.
- **Agricultural Education:** In a bid to guide and advise the farmers regarding the adoption of new technology arrangements should be made for agricultural education and extension services. It would assist the farmers to take proper crop-care leading to increase in crop productivity.
- **Land Reforms:** It is also suggested that efforts should be made to plug the loopholes in the existing land legislations so that the surplus land may be distributed among the small and marginal farmers.
- **Development of Cottage and Small Scale Industries:** In rural areas, more emphasis should be made to set up cottage and small scale industries. This will raise the income of the peasants and keep them busy during the off season.
- **Co-operative Farming:** To check the sub-division and fragmentation of holding, the movement of co-operative farming should be launched. Co-operative farming would result in the adoption of modern technology on so-called big farms.

Role of NGOs in agricultural development:

- As economic reform and liberalization saw the Government vacating several areas to let private sector entrepreneurship flourish and contribute to the high growth rate of the economy in recent years, a similar paradigm shift is needed to transform NGOs from their dependence on aid and grants from within and outside for transforming the rural scenario in the country.

This is sought to be achieved for the NGOs through engaging them in micro-finance, micro insurance, and micro-entrepreneurship activities for the overall development of the rural areas and to promote the welfare of the people of rural India. Some of the important roles played by NGO are:

- **Livelihood Enhancement:** Contribute to livelihoods by creatively marketing "value-added" cultivated and wild agricultural biodiversity.
- **Conservation:** Conserve local seed diversity, promote an increased reliance on biodiversity-based ecological agriculture, and use these as foundations for endogenous growth and development of rural communities.
- **Sustainable production:** Connect the natural elements—soil, water, air, sunlight, and seed—to ensure an abundance of nutritious food and other basic community needs.
- **Training farmers:** Enhancing the Ability of Farmers to Perform Task by Providing Ample Knowledge about various tasks.

- Create a gender-sensitive environment that enhances women's leadership skills.
- **Skill development:** Working On Skill Development to Empower Farmers With New Skills
- **Digital marketing of produce:** To help farmers by Showing the Right Channel of Market and Contacting Digitally.
- **Creating awareness:** Taking active role in Creating awareness On Different Government Schemes & Techniques for Helping Farmers
- Continue to nurture community participation and assist in building robust community institutions like SHGs, FPOs, Co-operative societies etc.
- NGOs have also developed innovative dissemination methods, relying on farmer-to-farmer contact, whether on a group or individual basis
- NGOs' rapport with farmers has allowed them to draw on local knowledge systems in the design of technology options and to strengthen such systems by ensuring that the technologies developed are reintegrated into them

A host of NGO's across the globe are involved in the above tasks for agricultural development. In the Indian context, few of the notable NGOs are DHAN, NERD, MYRADA, National Agro Foundation, REPCO Foundation for Micro Credit, SEVA etc.

Some of the major initiatives taken up by the NGOs are Watershed development program, Vermi-composting, Bio-fertilizer production training, Micro-finances, Agricultural Co-operatives, Farm Produce Organizations, Extension services etc.

Conclusion:

- Agriculture development should be such that it brings about a revolution in the agriculture industry to give birth to an agriculture which is profit giving and at the same time eco friendly.

Q) What do understand by peri urban agriculture? In what way can it aid in addressing the effects of climate change? Discuss. (250 words)

Reference

Why this question:

The question is based on the concept of 'Peri-Urban Agriculture'. One has to analyse how it would contribute in mitigating the effects of climate change.

Key demand of the question:

The answer must analyse the concept in detail and discuss its contributions in handling the climate change impact.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what is 'Peri-Urban Agriculture'.

Body:

The answer must have the following points of discussions:

Peri-urban agriculture occurs in surrounding the boundaries of cities throughout the world and includes products from crop and livestock agriculture, fisheries and forestry.

It also includes non-wood forest products, as well as ecological services provided by agriculture, fisheries and forestry. Often multiple farming and gardening systems exist in and near a single city.

Green zones around urban areas.

Reduction in phenomenon of Urban heat island.

Lower need for transportation.

Diversification of food basket.

Restrict unplanned urbanization.

Conclusion:

Conclude with urgent need for policy changes like effective legislation, long-term leases, leasing of the plots and gardens through a contract recognized by the municipality and correctly registered to promote participation by potential farmers, vegetable growers and livestock producers

**Introduction:**

- Peri-urban agriculture is defined as agriculture undertaken in places on the fringes of urban areas. It is usually carried out in surrounding the boundaries of cities throughout the world and includes products from crop and livestock agriculture, fisheries and forestry.
- It also includes non-wood forest products, as well as ecological services provided by agriculture, fisheries and forestry. Often multiple farming and gardening systems exist in and near a single city.

Body:**Peri-urban agriculture and mitigation of effects of climate change:**

- **Green zones around urban areas:** Beyond the agro-products provided, trees will help in sustaining ecosystems by acting as carbon sinks, protection of water-supply catchments for the cities, protection against landslides thus helping climate change mitigation.
- **Reduction in phenomenon of Urban heat island:** Due to dense population and use of concrete as building material urban heat islands with higher temperature than surrounding areas are created.
- **Lower need for transportation:** Due to rapid urbanization in the past years, demand for vegetables, fruits and flowers are constantly increasing in these areas. Peri-urban agriculture will reduce the burden on transport, and help in reducing greenhouse gas emissions from cold storages.
- **Diversification of food basket:** Peri-Urban Agriculture can help in climate change adaptation through diversification of food resources for the urban population.
- **Restrict unplanned urbanization:** Unplanned and rapid urbanization causes environmental pollution which causes climate change. Peri-Urban Agriculture will help in creating attractive employment option and prevent the conversion of agricultural land near urban areas into cities and towns

Other merits of Peri-Urban agriculture:

- Urbanisation in India is growing and the problem of food inflation largely rises from the demand-supply gaps in urban areas.
- One way of stabilising the prices of vegetables and fruits in urban areas is to promote peri-urban horticulture by providing the necessary technical and marketing support.
- Decentralised production, as for example in Israel, could be supported by cooperative marketing.
- Urban and peri-urban 'horticulture revolution' could pave the way for more stable prices to the consumer
- At the same time, we should ensure that the quality of the food remains high and free of pesticide residues and other unsafe chemicals.
- Thus, we can ensure stability of supply coupled with high quality and safe food, while contributing to price stability.
- The urban population demands special foods particularly fruits and vegetables. Therefore, a peri-urban farming programme would be timely.

Conclusion:

- With urbanization on the rise, the peri-urban agriculture throws a brilliant opportunity from socio-economic as well as environmental point of view.
- The need of the hour is policy changes like effective legislation for leasing of the plots and gardens through a contract recognized by the municipality and correctly registered to promote participation by potential farmers, vegetable growers and livestock producers.

Q) Discuss the scope of replication of 'White Revolution' in India. (250 words)

Indian Geography by Majid Hussain

Why this question:

The answer must discuss the scope of white revolution.

Key demand of the question:

The answer must evaluate the scope of white revolution in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Describe what is white revolution.

**Body:**

The question is direct one has to discuss the success of white revolution in the past and the possible white revolution 2.0 in the coming future.

Students must make use of facts and figures to justify the potential of the revolution in India.

Conclusion:

Conclude with way forward.

Introduction:

- The huge increase in milk supply through concerted efforts on a cooperative level is known as the **White Revolution**. Forty-eight years after **Operation Flood** – that made India the world's largest milk producer – India continues to be on the lookout for the next breakthrough in agricultural produce and productivity.

Body:**Milk production in India:**

- India is the world's largest producer and consumer of dairy products.
- Currently India has 17% of world output of dairy products, surpassing USA in 1998 as world's largest producer of dairy. All this was achieved by operation Flood which was launched in 1970's.
- According to market research company IMARC, the milk and dairy products industry reached Rs7.9 lakh crore in 2017.
- In 2016, the milk sector alone was valued at Rs3 lakh crore and is projected to scale Rs7.3 lakh crore by 2021.
- The per capita milk availability in India has gone up from 126 gm per day in 1960 to 359 gm per day in 2015.

Potential of dairy sector:

- The dairy industry in India is unique. With six lakh villages housing about 90 crore people, dairying is not just a large economic activity but also an integral part of our social and cultural heritage
- Its uniqueness lies in its unifying power, in the fact that no other industry touches lives of millions of farmers, of which 70 per cent are landless.
- Complementing this are Indian climatic conditions that support animal husbandry. Dairy, in effect, could become a great tool for equitable growth and income distribution.
- What remains is providing market access by offering stable and remunerative prices to farmers and encouraging this generations-old sustainable livelihood source.
- Can help small farmers to reduce dependence on crop sales
- Can increase source of income of farmers in low yielding areas like Marathwada, Bundelkhand etc
- India is surrounded by countries and regions that are milk-deficient, such as the Middle East, South Asia and Southeast Asia.
- There is ample scope for export of value-added milk products to Bangladesh, China, Singapore, Thailand, Malaysia, Philippines, Japan, the UAE, Oman and other gulf countries, all of which are located close to India.
- At present, the population of South Asia alone is growing at 1.3 per cent a year; it is likely to be 2.2 billion by 2050. This presents an opportunity for India's dairy industry.

Need for White Revolution 2.0:

- As per UN-DESA estimates, by 2025, India will beat China to become the most populous country in the world with 1.4 billion people.
- Further, by 2060, 56 per cent Indians will reside in urban areas and 44 per cent in rural areas. India is likely to have 143 cities with a population of more than one million by 2060.
- On the other hand, the number of villages will witness only a marginal increase, from 640,000 lakh in 2012 to just 675,000 lakh in 2060.
- This clearly indicates that India will face the problem of 'mouths to feed' growing faster than 'hands to produce'.
- To help alleviate the agrarian distress this is being faced in past 5 years.
- To reduce the malnourishment and increase the "milk security" for every citizen.

Challenges to White Revolution 2.0:

- The Indian cows and buffaloes are generally low yielding and non-descript because of the lack of healthy cattle-feed and fodder, tropical heat and diseases.
- Despite lack of water and gradually declining arable land, dairy farming is on the rise.
- Free trade agreements, or FTAs, for instance, will allow EU government-subsidised products to be imported from Europe with little entry barriers. This will pose a big challenge to cow-farmers.
- Due to unhygienic production, handling conditions and high temperatures, the quality of milk is adversely affected.

- Because of inadequate marketing facilities, most of the marketable surplus is sold in the form of ghee which is the least remunerative of all milk products.

Measures needed:

- Education and Training at Panchayat level for small and medium size farmers
- Subsidizing cattle production and encouraging cattle markets
- Facility of logistics for produced milk
- Improved Veterinary facility specially in artificial insemination of cattle
- Encouraging private sector firm to procure dairy produced at rural level
- Low interest loans for small and medium scale farmers for cattle purchase
- Encouraging rural women to take up animal husbandry
- Insurance of cattle against diseases like Anthrax, Foot and Mouth, Peste des Ruminantes, etc.
- Nurture dairy entrepreneurs through effective training of youth at the village level coupled with dedicated leadership and professional management of farmers' institutions.
- Agricultural practices, sanitation, quality of drinking water & fodder, type and quality of pipelines – all of these need to be aligned to the goal of healthy milk.

Q) Discuss the pattern of land holdings in India and the challenges related to land fragmentation also suggest possible solutions to the problems. (250 words)

A comprehensive geography by Khullar

Why this question:

The question is about dealing the issues related to agriculture with specific focus on land holdings and land fragmentation issues.

Key demand of the question:

The answer must discuss the problems related to land holdings, land fragmentations and their effect on the agriculture practices of the country and farm income.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief write up on the current conditions of land holdings.

Body:

Discussion should include the following:

Paint a picture of the current status of land holdings in India, what are the issues associated with it, why is it a cause of concern? What are the challenges posed by it etc.

Then discuss the impact of it on farmers, what needs to be done to overcome the challenges and concerns.

Conclusion:

Conclude with solutions and suggest way forward.

Introduction:

- The term land holding or 'agricultural holding' indicates average size of agricultural land held by the farmers in India.
- The number of small and marginal agricultural land holdings in the country (known as operational holdings) has registered a marginal increase in 2015-16 compared to 2010-11, according to the **Tenth agricultural census**. This means that there are more people who now own smaller parcels of agricultural land.

Body:

Trends in land holding (Agricultural Census 2015-16):

| Classification | Range (ha) | 2010-11 (mn.) | 2015-16 (mn.) | % change |
|----------------|------------|---------------|---------------|----------|
| Small | <1 | 117.25 | 125.86 | 7.34% |
| Medium | 1-4 | 19.72 | 19.3 | -2.13% |
| Large | 4-10 | 0.98 | 0.83 | -15.31% |

- The percentage of land holders who are women has increased from 12.79% in 2010-11 to 13.87% in 2015-16, with a corresponding increase of 1.2 percentage points in the operated area.
- This shows that more and more females are participating in the management and operation of agricultural lands.
- Marginal, small and medium land holdings constitute the lion's share of operated area – large land holdings account for only 9% of the total operational area.
- The average size of operational holdings is highest in Nagaland (5 hectares) and lowest in Kerala (0.18 hectares).
- The total number of land units used for agricultural production has shown a 5% increase in 2015-16 compared to 2010-11.
- The total number of operational holdings in the country has increased from 138 million in 2010-11 to 146 million in 2015-16.
- Uttar Pradesh is home to the largest number of land holders, constituting 16% of the total number.

Land fragmentation

- It refers to the breakdown of the landholdings to smaller, unviable tracts of lands due to inheritance laws.
- The land belonging to the father is equally distributed among his sons. This distribution of land does not entail a collection or consolidated one, but its nature is fragmented.
- Demographic pressure has pushed down the land: man ratio to less than 0.2 hectares of cultivable land per head of rural population.
- It has also progressively pushed down the size structure of landholdings.
- The problem of small and fragmented holdings is more serious in densely populated and intensively cultivated states like Kerala, West Bengal, Bihar and eastern part of Uttar Pradesh where the average size of land holdings is less than one hectare and in certain parts it is less than even 0.5 hectare.
- About 92% of holdings operated by SC groups comprised small and marginal holdings.

Challenges posed by Land fragmentation:

- Sub-division and fragmentation of the holdings is one of the main causes of our low agricultural productivity and backward state of our agriculture.
- A lot of time and labour is wasted in moving seeds, manure, implements and cattle from one piece of land to another.
- Irrigation becomes difficult on such small and fragmented fields.
- Further, a lot of fertile agricultural land is wasted in providing boundaries. Under such circumstances, the farmer cannot concentrate on improvement.
- The farm mechanization cannot be applied in small land holdings.
- Although legislation for consolidation of holdings has been enacted by almost all the states, it has been implemented only in Punjab, Haryana and in some parts of Uttar Pradesh.
- The shrinking of productive agricultural land and land base being utilized for non agricultural purposes also makes the crises of fragmented land holdings multi-dimensional.
- Research suggests that only 14% of marginal and 27% of small holdings were able to get credit from institutional sources whereas about 33% of medium and 29% of large farmers could avail institutional credit in India.
- Producers with small holdings also often face problems due to inefficiencies in transporting their produce leading to increased dependence on middlemen. Therefore, there is loss of income which becomes the middleman's commission.

Measures needed:

- To ensure farmer-centric agricultural development, land consolidation efforts for good quality and efficient farming needs to be undertaken.
- **Cooperative farming:** Cooperative farming is a method wherein farmers pool their resources in certain areas of agricultural activity for mutual benefit.
- **Contract Farming and Collaborative Farming initiatives:** Though contract farming does not directly help in preventing fragmentation, the need of contractual requirements can be a tool for farmers to collaborate for joint cultivation.
- **Corporate farming:** Large corporate and MNCs that are into agricultural supply chain often try to integrate and consolidate their product supply chains to have better control on costs and ensure supply security.

- NGOs, farmer associations and the extension wing of the agricultural ministry at the grass root level should educate small and marginal farmers on the benefits of land consolidation which will reap benefits in scaling up of their operations and increasing profitability.
- India has a robust and effective Panchayati Raj system that is an institutional forum for undertaking developmental projects. Pilot studies of collective farming, structured and monitored by the Panchayats can be undertaken at various gram and zila parishad levels.

Conclusion:

- While Indian agriculture has shown resilience to many shocks that penetrated into the world in the last decade, the farmers are successfully producing crops in spite of many hardships. However, all this will change in the coming decades as growing population, further fragmentation, land conversion will lead to lower productivity, shortage of labour and dwindling natural resources.
- These may put us back in the grip of a perennial food crisis. There is, therefore, a great responsibility on the farming community and the government alike to realize this future shock and take proactive steps to avoid such crises. Consolidation is one such solution theme.

DREAM IT. DO IT.

Topic: Infrastructure: Energy, Ports, Roads, Airports, Railways etc., Investment Models.

Q) What are the challenges facing Indian Telecom sector? Discuss. Also suggest what needs to be done to overcome these challenges. (250 words)

Livemint

Why this question:

The article discusses in detail the challenges that are Indian telecom sector is facing.

Key demand of the question:

One has to detail upon the list of issues Indian telecom sector is facing and suggest what needs to be done.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction – quote facts on the current scenario.

Body:

Discussion should include the following:

- Explain Challenges in Telecom Sector – Lack of fixed line penetration, High Right-of-Way (ROW) cost, spectrum allocation, corruption etc.
- Explain the initiatives taken by the government in this direction to resolve the concerns.
- Then move on to suggest solutions as to what can be done.

Conclusion:

Future of Telecom Sector is very bright as its role will be seen in almost everything. A long-term vision plan should be made accordingly. For the time being, the government needs to provide an easy and soothing environment for telecom operators.

Introduction:

- India's telecom industry has been through a paradigm shift over the last three decades.
- The industry has also undergone significant policy and regulatory changes through the years, in essence, leading to a control of market share of services by a few players.
- Despite its considerable place in the Indian economy, the telecom sector is under stress due to mounting debt and other issues.

Body:

The challenges facing Indian telecom sector are:

- **Financial Health of the Sector:** Gross revenue has dropped by 15% to 20% for the year 2017-18 over the preceding year for the incumbents and overall sector revenue has dropped. Also, there is drop in voice and data revenue per user
- **Limited Spectrum Availability:** Available spectrum is less than 40% as compared to European nations and 50% as compared to China. Hence, it is imperative that spectrum auctioning at sustainable prices is the need of the hour. Also, government auction spectrum at an exorbitant cost which makes it difficult for mobile operators to provide services at reasonable speeds.
- **High competition and tariff war:** Competition heating up post entry of Reliance Jio. Other telecom players have to drop in tariff rates both for voice and data
- **Lack of Telecom Infrastructure in Semi-rural and Rural areas:** Service providers have to incur huge initial fixed cost to enter semi-rural and rural areas. Key reasons behind these costs are lack of basic infrastructure like power and roads, resulting in delays in rolling out the infrastructure.
- **Poor fixed line penetration:** India has very little penetration of fixed line in its network whereas, most of the developed countries have a very high penetration of fixed lines
- **High Right-of-Way (ROW) cost:** Sometimes, states governments charge a huge amount for permitting the laying of fibre etc.
- **Lack of trained personnel** to operate and maintain the cellular infrastructure.
- **Delays in Roll Out of Innovative Products and Services:** Substantial delays in roll out of data-based products and services are hampering the progress of telecom sectors. This is primarily due to the non-conducive environment resulting out of government policies and regulations.

- **Low Broad Band Penetration:** Low broadband penetration in the country is a matter of concern and the government needs to do a lot more work in the field to go up in the global ladder.
- **Over the top services:** Over the Top (OTT) applications such as WhatsApp, OLA, Viber and so on do not need permission or a pact with a telecommunications company. This hampers the revenue of telecommunication service provider.
- **License fee:** The license fee of eight per cent of the Adjusted Gross Revenue including five per cent as Universal Service Levy (USL) is one of the highest in the world.

Measures needed:

- **Infrastructure Sharing:** Since telecom business is heavy on capex and as much as 40%– 60% of the Capex is utilized for setting up and managing the Telecom infrastructure. By sharing infrastructure, operators can optimize their capex, and focus on providing new and innovative services to their subscribers.
- **Availability of Affordable Smart Phones and Lower Tariff Rates:** This would increase tele penetration in rural areas.
- **Curb on predatory pricing:** government should fix a minimum price to save the industry from price war
- **Lower License fee:** The license fee of eight per cent of the Adjusted Gross Revenue including five per cent as Universal Service Levy (USL) is one of the highest in the world.
- **Reduce reserve price for spectrum auction:** In the past, some of the operators participated recklessly in these auctions leading to exaggerated prices — much above their true valuations. Reasonable reserve prices for the market mechanisms induce “truthful bidding”, and not leading to “winners’ curse” as witnessed in some of the previous auctions.
- The government should increase the network area through optical fibre instead of copper which is expensive. This is necessary to ensure last mile connectivity.
- The government needs to prepare a ground for easy right-of-way permissions and lower cost of right-of-ways
- The government should spend large on R&D and create an environment that makes India capable of manufacturing and even exporting hardware components like mobile handsets, CCTV Cameras, touch screen monitors etc.

Conclusion:

- Digital India Initiative of government including digital identification and authentication, e-KYC, digital finance depends heavily on the telecom and broadband infrastructure.
- Economic survey 2017-18 also underlined that the ‘crisis’ being faced by telecom sector. Survey added that it has also deeply impacted their investors, lenders, partners and vendors.
- A long term vision plan should be made accordingly. For the time being, the government needs to provide an easy and soothing environment for telecom operators.

Q) Discuss the role played by transport infrastructures in developing financial markets vis-à-vis economic growth. (250 words)

Livemint

Why this question:

The article discusses in detail a study that highlighted how The Golden Quadrilateral highway network spurred greater financial activity but only in areas with existing financial development.

Demand of the question:

The answer must discuss the role played by infrastructures in developing financial markets vis-à-vis economic growth.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

Start with brief introduction on importance of transport system for economic growth of a country.

Body

One can have the following points in the answer:

Economic Growth: A good transportation system is an important selling point to communities that desire to attract development that provides for employment and growth of a city. If transport costs due to congestion increase, goods and services produced within that city tend to increase in costs thus

losing competitiveness in international markets. Efficient transportation access is therefore a very important consideration as it has a direct impact on sound and sustainable economic growth and productivity. The cost of congestion in the Western Province of Sri Lanka is over Rs 20,000 million per year (around 2 percent of Regional GDP). This includes the cost of productive time and wastage of fuel.

Quality-of-Life: To some people, congested highways are a symptom of deteriorating quality-of-life-in a community. The amount of time that is spent on commuting to and from work is also in reality, time that is taken away from social interactions or pursuit of activities that have a personal value and satisfaction.

- Discuss in detail how investing in infrastructure in regions with basic financial development can help regions overcome barriers to economic growth.
- Explain with the case study of India's Golden Quadrilateral network.
- Discuss the Indian scenario – present status, what more needs to be done in this direction etc.

Conclusion

Conclude that financial markets respond to large infrastructure investments and helps spur real economic outcomes contingent on initial financial sector development

Introduction:

- Infrastructure is a key driver of the overall development of Indian economy.
- It is seen that investments in infrastructure equal to 1% of GDP will result in GDP growth of at least 2% as infrastructure has a “**multiplier effect**” on economic growth across sectors.
- The recent headway made in developing transport infrastructure will prove to be the biggest enabler for growth.

Body:

- The critical role of finance in economic growth is widely acknowledged and developing well-functioning financial markets has become a central focus of economic policies across the world.
- A new World Bank study suggests that investing in infrastructure in regions with basic financial development can help these regions overcome barriers to economic growth.

The role played by transport infrastructures in developing financial markets vis-à-vis economic growth:

- Infrastructure development helps in **poverty reduction** due to its high employment elasticity leading to huge job creation capabilities.
- It also has the **trickle-down effect** as better transportation infra can lead to access to education, health and other basic necessities.
- **Increasing the manufacturing growth** as there is better connectivity, easier movement of goods and services, facilitating private investments
- **It reduces the regional and inter-state disparities** and leads to a balanced economic growth by regional equality.
- Infra sector **has huge spill-over effects** on other sectors of economy. It **has money-multiplier** effect too.
- **Better quantity and quality of infrastructure** can directly raise the **productivity of human and physical capital** and in turn growth of nation.

The progresses made in creating an efficient transport infrastructure in the country are

- At the highest ever pace of construction, more than 35,000 km of national highways has been built in last four and a half years.
- World-class expressways such as the Eastern Peripheral Expressway and Western Peripheral Expressway.
- Technologically sound projects which are engineering marvels such as the Dhola-Sadiya Bridge, Chenani Nashri Tunnel and Bogi-Beel bridge.
- The **Bharatmala Pariyojana** is unique and unprecedented in terms of its size and design, as is the idea of **developing ports as engines of growth under Sagarmala**.
- The development of **111 waterways** for transport, **FASTags** for quicker toll payment and movement of vehicles on highways.
- The promotion of alternative fuels such as **ethanol, methanol, biofuels, and electricity**, as well as innovative modes of travel such as seaplanes and aeroboats. The concept of ‘**waste to wealth**’ is being employed for generating alternative fuels.
- Measures are taken to enhance road safety like the **Motor Vehicles Amendment Bill, The Good Samaritan law etc, reducing congestion and pollution levels and providing roadside amenities**.

- Connectivity to our neighbouring countries using an optimal mix of roads and waterways lie Afghanistan and beyond through Chahbahar, or Bangladesh, Myanmar and Thailand through upcoming highways and waterways.
- A memorandum of understanding (MoU) has been signed with Austrian ropeway company Doppelmayr for building ropeways through congested cities and hilly areas.

Impact of infrastructure projects on financial markets:

- Infrastructure investment can help financial markets converge towards more developed regions.
- Financial markets respond to large infrastructure investments and helps spur real economic outcomes contingent on initial financial sector development.
- Consequently, areas with high initial financial sector development will play an important role in determining where economic activity will grow.
- Caution must be taken against simply investing in large-scale infrastructure and hoping that this will automatically develop financial markets.

Case study: the construction of **India's Golden Quadrilateral central highway network**, together with comprehensive loan data from the Reserve Bank of India, the study finds a disproportionate increase in the number of loans disbursed and average loan size in newly connected districts along India's Golden Quadrilateral network. The improved transportation infrastructure results in increased economic activity which in turn increases bank lending. Importantly, the authors find that these effects were stronger in districts where the banking sector and financial institutions were already sufficiently developed

Conclusion:

- An efficient transport infrastructure is the biggest enabler for growth.
- India's growth story should no longer be impeded by a lack of efficient transport infrastructure, and the fruits of this growth should reach everyone in the remotest part of the country.

Q) The mobility landscape in India is undergoing a remarkable and revolutionary change with ecological responsibility and clean mobility making inroads in the country. Analyse in detail the transition from fossil fuels to the electric vehicles. (250 words)

[Livemint](#)

Why this question:

The article talks about the mobility sector and the transformation it is undergoing in India.

Key demand of the question:

The answer must analyse in detail the new agenda that is focusing on electric mobility in India.

Directive:

analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Begin by explaining the statement in the question and suggest its significance.

Body:

Discussion should include the following:

- First quote facts/data related to the transport and mobility sector in India.
- Explain what is the new transformation? Why is it?
- What are the associated challenges/concerns?
- What needs to be done?
- Role of all stakeholders etc.

Conclusion:

Conclude by stating that the transformation is inevitable given the current circumstances and rising population pressure and their demands.

Introduction:

- Electric vehicles (EVs) are automobiles that run on electricity only. They are propelled by one or more electric motors powered by rechargeable battery packs. Electric vehicles are cleaner than petroleum-fuelled vehicles and are seen as a promising solution to global warming.

**Body:**

- Indian government is making strong push in favour of the electric vehicles or the e-vehicles. Government is also encouraging or sometimes even forcing auto industry to shift towards the e-vehicles. While e-vehicles have their benefits over normal vehicles, the topic of e-mobility seems to be missing from the agenda of the government.
- E-vehicles reduce the localized pollution and are important in the cities like Delhi, Pune, Lucknow etc. Such vehicles would also reduce the dependence on the petroleum, import of which has adverse effect on Indian economy. E-vehicles are also instrumental in reducing the emission of green-house gases and many health hazards.

Building the momentum

The government has been urging the automakers and component manufacturers to invest in development of EVs, and has also sanctioned an outlay of ₹10,000 crore to promote adoption of electric mobility.

Components of EV ecosystem

DEMAND SIDE FACTORS

SUBSIDIES and incentives including fiscal and non-fiscal incentives like registration tax, grants, tax waive-offs, buyback of old vehicles, free parking etc.

DEMAND aggregation like bulk procurement

SUPPLY SIDE FACTORS

MANUFACTURING incentives like provision of land at subsidized rates, tax holiday, special zones

ACCELERATED research and development promoted industry partnerships

ENABLERS

CHARGING infrastructure, institutional mechanisms, technology, financial mechanisms, policy framework

Electric two-wheeler potential

Electric two-wheeler growth in China (in million)

Electric two-wheeler growth in India (in million)

Source: Automotive Component Manufacturers Association of India (ACMA) and Roland Berger

Challenges facing the transition:

- **Price Volatility:**
 - The first has to do with policy volatility. E-mobility is a nascent industry in India and most of the developing countries. Capital costs are high and the payoff is uncertain.
 - Inconsistencies remain. For instance, while electric vehicles are taxed at 12% under the goods and services tax (GST), batteries were taxed at 28% until recently. This has now been lowered to 18% but the discrepancy still exists.
- **Lack of policy certainty: Cannot frame in Isolation:**
 - The lack of policy certainty spills over into perhaps the single most important element of enabling e-vehicle usage: charging infrastructure.
 - Lack of attention on building charging infrastructure.
- **Local and Private Investment results in Low Cost production Technology:**
 - Localization is another tricky area, as the strife caused by the rupee's depreciation has shown.
 - India does not have any known reserves of lithium and cobalt, which makes it entirely dependent on imports of lithium-ion batteries from Japan and China.
- **Short Driving Range and Speed**
 - Most of these cars have range about 50-100 miles and need to be recharged again.
- **Battery Recharge Issues**
 - An electric car takes about 4-6 hours to get fully charged. Therefore there is a need for dedicated power stations as the time taken to recharge them is quite long.
- **Silence as Disadvantage**
 - Silence can be a bit disadvantage as people like to hear noise if they are coming from behind them
 - An electric car is however silent and can lead to accidents in some cases.
- **Limited seating capacity**
 - They are not meant for entire family and a third person can make journey for other two passengers bit uncomfortable.
- **Not Suitable for Cities Facing Shortage of Power**
 - Cities already facing acute power shortage are not suitable for electric cars.
 - The consumption of more power would hamper their daily power needs.
- **High cost**
 - The primary reason for the current high prices of EVs is the expensive battery

Way forward:

- For EVs to contribute effectively, we need commensurate efforts in developing an entire ecosystem.
- Need to shift the focus from subsidizing vehicles to subsidizing batteries because batteries make up 50% of EV costs.
- Increasing focus on incentivizing electric two-wheelers because two-wheelers account for 76% of the vehicles in the country and consume most of the fuel.
- A wide network of charging stations is imminent for attracting investment.
- Work places in tech parks, Public bus depots, and Multiplexes are the potential places where charging points could be installed. In Bangalore, some malls have charging points in parking
- Corporates could invest in charging stations as Corporate Social Responsibility compliances.
- Addressing technical concerns like AC versus DC charging stations, handling of peak demand, grid stability etc.
- Private investment in battery manufacturing plants and developing low cost production technology is needed.
- India is highly dependent on thermal sources, which account for about 65% of current capacity. As EV adoption increases, so should the contribution of renewables.
- Need for a policy roadmap on electric vehicles so that investments can be planned.
- Acquiring lithium fields in Bolivia, Australia, and Chile could become as important as buying oil fields as India needs raw material to make batteries for electric vehicles.
- Providing waiver of road tax and registration fees, GST refunds and free parking spaces for EVs.

Topic: Science and Technology- developments and their applications and effects in everyday life

Q) AI-driven technology will become counterproductive if a legal framework is not devised to regulate it. Discuss. (250 words)

The hindu

Why this question:

The article discusses in detail how AI-driven technology will become counterproductive if a legal framework is not devised to regulate it.

Key demand of the question:

The answer must discuss as to how if AI is not regulated properly, it is bound to have unmanageable implications. One has to explain the nuances of the law to regulate the use of AI.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few introductory lines discuss the issues and concerns around using AI.

Body:

In brief discuss what are the possible challenges that could be posed by AI in the absence of proper regulations. Explain predicting and analyzing legal issues and their solutions, however, is not that simple.

Suggest what should be the way forward.

Conclusion:

Conclude with what more needs to be done.

Introduction:

- Artificial Intelligence is a way of making a computer or a software think intelligently, in the similar manner the intelligent humans think. AI is associated with superlative memory, calculative power, decision-making capacity, high speeds of action.
- AI is wholly based on data generated and gathered from various sources and has lot of chances to be in conflict with law. Our laws will eventually need to be amended or new laws for artificial intelligence technologies and processes will need to be adopted to fill up existing lacunae.

Body:

Recent AI developments in India: the various instances below symbolise the arrival of Artificial Intelligence (AI) in everyday lives of human beings.

- Kerala police inducted a robot for police work.
- Around the same time, Chennai got its second robot-themed restaurant.
- Here, robots not only serve as waiters but also interact with customers in English and Tamil.
- In Ahmedabad, a cardiologist performed the world's first in-human tele-robotic coronary intervention on a patient nearly 32 km away.

AI and Legal framework:

- AI systems have the capability to learn from experience and to perform autonomously for humans.
- This also makes AI the most disruptive and self-transformative technology of the 21st century.
- So, if AI is not regulated properly, it is bound to have unmanageable implications.
- g. the consequence if electricity supply suddenly stops while a robot is performing a surgery and access to a doctor is lost
- These questions have already confronted courts in the U.S. and Germany.
- No comprehensive legislation to regulate this growing industry has been formulated in India till date.
- All countries, including India, need to be legally prepared to face such kind of disruptive technology.
- AI is growing multi-fold and we still do not know all the advantages or pitfalls associated with it which is why it is of utmost importance to have a two-layered protection model: one, technological regulators; and two, laws to control AI actions as well as for accountability of errors.

Challenges to AI legal framework:

- Predicting and analysing legal issues in regards with AI use and their solutions are not that simple.
- g. an AI-based driverless car getting into an accident that causes harm to humans or damages property
- In such cases, criminal law may face drastic challenges as the party to be held liable is disputable.

- Legal personhood is inherently linked to individual autonomy but has not been granted exclusively to humans. No law currently in force recognises AI as a legal person.
- Another concern is the ability of an AI to execute and be bound by contracts. While international laws have recognised self-enforcing contracts, there is a need for a comprehensive legislation on the subject.
- Under Indian law only a “legal person” can be competent to enter a valid contract. The general rule thus far has been that an AI may not qualify as a legal person. Hence, a contract entered into by an AI of its own volition may not be regarded as a valid contract in India.
- Another issue that arises is attributing liability to an AI. The general rule has been that since an AI cannot qualify as a legal person, it cannot be held liable in its own capacity.

Way Forward:

- The first need is to have a legal definition of AI in place.
- It is essential to establish the legal personality of AI which means AI will have a bundle of rights and obligations, in the context of India’s criminal law jurisprudence.
- Since AI is considered to be inanimate, a liability scheme that holds the producer or manufacturer of the product liable for harm must be considered.
- Moreover, since privacy is a fundamental right, certain rules to regulate the usage of data possessed by an AI entity should be framed.
- This should be a part of the Personal Data Protection Bill, 2018.

Conclusion:

- The present debate about AI is between human redundancy and evolution of technology. Either way, the reality is that AI has entered the market and, pros and cons aside, the need of the hour is to estimate the problems and have solutions to deal with them in advance.

Extra information:

Case study: Let’s take the example of AI in the form of personalised chatbots. Chatbots are chat-based interfaces which pop up on websites with which customers can interact. These chatbots can either follow a scripted text or through machine learning (ML) and increased interaction deviate from the standard questions to provide a more human-like interaction. In the course of communicating with the chatbot, if a person were to divulge sensitive personal information for any reason whatsoever, what happens to this data?

- Disclosure of sensitive personal information in the digital space would fall within the purview of the IT (Reasonable Security Practices and procedures and sensitive personal data or information) Rules, 2011.
- So in the case of an ML chatbot which does not work as per a scripted text and has collected sensitive personal information, who is responsible if Rule 5(3) is breached? The most obvious answer would be the business unit/company because the rules in the 2011 Rules state that “The body corporate or any person who on behalf of the body corporate...” collects information. However, could the business possibly avoid liability by claiming that it was not aware that the chatbot, due to its AI ability of machine learning, had collected sensitive and personal information?
- We do not have any clear provisions for advanced chatbots which do not work on a scripted text. With the lack of a clear provision in the law, accountability may take a hit. Additionally, what happens if an AI robot is given citizenship in India? Who is responsible for their actions? Or in case of autonomous car accidents, who is responsible for damage to property or harm caused or death of a person?

Q) “Rising machine intelligence is a double-edged sword”, Elucidate. (250 words)

[Livemint](#)

Why this question:

The question is straightforward, the article analyses the pros and cons of AI in detail.

Key demand of the question:

Discussion should focus mainly in evaluating the Technology of artificial intelligence.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief introduction on what you understand by AI.

Body:

Explain that There has been a growing chorus of alarm about the existential threat of Artificial Intelligence (AI). Eminent personalities such as Stephen Hawking, Steve Wozniak and Elon Musk have come out in public to state that if we continue to blindly develop machine intelligence, we will inevitably get to a point where machine intelligence will exceed that of humans.

Argue both the sides – for and against and form a fair and balanced opinion suggesting a way forward.

Conclusion:

Conclude by reasserting the need to moderate the use of such technologies and need for exercising care to experiment with.

Introduction:

- Machine learning is part of a broader family of machine learning methods based on learning data representations, as opposed to task-specific algorithms. Neural network depicts the complex interlinkages of the different data that is accumulated over time, like in a brain.
- Eminent personalities such as Stephen Hawking, Steve Wozniak and Elon Musk have come out in public to state that if we continue to blindly develop machine intelligence, we will inevitably get to a point where machine intelligence will exceed that of humans.

Body:

Pros of Rising Machine intelligence:

- There is an artificial intelligence (AI)-driven \$15.7 trillion game-changer that is unfolding. Of this, India can claim a \$957 billion boost to its gross domestic product in the next 12-15 years.
- The global digital transformation market is expected to grow from \$ 445.4 billion in 2017 to \$ 2,279.4 billion by 2025.
- The World Economic Forum estimates 133 million new roles may emerge globally in a few years.
- These new jobs will be different and will require higher application of cognitive skills alongside working with deep technologies.
- The race for talent acquisition is intense. Countries have started to put in place national digital skills strategies, including in Asia.
- Increasingly powerful computing devices and networks, digital services, and mobile devices, this can become a reality for people around the world, including those in underdeveloped countries.
- Advances in biomedical sciences can lead to healthier lives and longer life spans. They can lead to innovations in neuroscience, like connecting the human brain to computers to enhance intelligence or experience a simulated world.
- Digital technology can liberate workers from automatable tasks, freeing them to concentrate on addressing more complex business issues and giving them more autonomy.

Cons of Rising Machine intelligence:

- The cutting-edge technologies such as AI will disrupt 70% of market leaders across industries in the next 10 years.
- The **World Economic Forum** estimates 75 million jobs may be displaced globally in a few years.
- McKinsey says globally, 400 to 800 million jobs may be displaced by 2030, requiring as many as 375 million people to switch job categories entirely.
- The **skill gap is significant** and is being acutely felt across industries.
- The economic benefits of the rising AI are becoming more concentrated among a small group.
- This **increasing inequality** can lead to political polarization, social fragmentation, and lack of trust in institutions.
- Technological advances are also broadening the **scope of surveillance**. In the UK today, an estimated 6 million CCTV cameras are recording activity all over the country.
- Public trust in business, government, the media, and even technology is falling**. This is a crisis that is dividing societies and creating instability around the world

Way forward:

- Re-Skilling:**
 - Re-skilling and upskilling will have to be undertaken by every stakeholder.
 - Massive open online courses to re-skill the Workforce participants by companies using their own learning platforms and tapping into their partner networks.
 - Learning has happened in silos where learners have been pitted against one other. This has to morph into a collaborative mindset to create an environment of shared learning.

- Industry needs to have deeper engagements with academia, Centres of Excellence and research labs to reach our optimum potential.
- Universities will have to re-train to ensure students are employable in the digital era.
- **Investment:**
 - Indian IT is taking convincing strides to sustain its position as the preferred transformational partner for global clients. Towards this, investments of about ₹10,000 crore have been earmarked for re-skilling.
 - The government doubled its Digital India budget to \$480 million in 2018-19, which will be used for research and training in deep tech.
- **Initiatives:**
 - The announcement of the National AI Centre, AI portal, and the identification of nine areas to be driven by technology are positive steps towards evangelisation.
 - the Karnataka government along with Nasscom has launched a CoE for data science and AI.
- **Global Approach:**
 - As many as 20 countries across the globe have adopted AI National Strategy. Governments worldwide recognise the inevitable shift and are adopting AI, analytics, and allied technologies to deliver citizen-centric services, including real-time response.

Conclusion:

- We have to consciously build positive values into the technologies we create, think about how they are to be used, and design them with ethical application in mind and in support of collaborative ways of preserving what's important to us.
- This effort requires all stakeholders—**governments, policymakers, international organizations, regulators, business organizations, academia, and civil society**—to work together to steer the powerful emerging technologies in ways that limit risk and create a world that aligns with common goals for the future.

Q) What do you understand by 'Superconductivity' ? Give it uses and applications. also, the claim of superconductivity to work at room temperature has been claimed to be significant, discuss why ? (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article discusses the recent research with respect to superconductivity. IISc researchers have reported superconductivity at room temperature. Their finding, now under review, will be a breakthrough if verified.

Key demand of the question:

The answer must explain the concept of superconductivity and the significance of recent discovery in this direction.

Structure of the answer:

Introduction:

Begin with brief introduction on the concept of superconductivity.

Body:

Discussion should include the following:

Superconductivity is a phenomenon which occurs in certain materials and is characterized by the absence of electrical resistivity. Superconductors have the ability to conduct electricity without the loss of energy. Inside a superconductor the behaviour of electrons is vastly different. The impurities and lattice are still there, but the movement of the superconducting electrons through the obstacle course is quite different.

Then move on to explain the merits and demerits, significance.

Conclusion:

Conclude with way forward.

Introduction:

- Superconductivity is a state in which a material shows absolutely zero electrical resistance. While resistance is a property that restricts the flow of electricity, superconductivity allows unhindered flow
- Materials are said to be exhibiting superconductivity when they exhibit the following two characteristics after being cooled below their critical temperature: **zero electrical resistance and expulsion of magnetic fields (Meissner effect).**

- All the electrons align themselves in a particular direction, and move without any obstruction in a “coherent” manner. Because of zero resistance, superconducting materials can save huge amounts of energy, and be used to make highly efficient electrical appliances. IISc researchers have reported superconductivity at room temperature. Their finding, now under review, will be a breakthrough if verified.

Body:

Applications:

- **SQUIDS (Superconducting Quantum Interference Devices)** can be used to take **magnetic cardiograms** based on magnetic fields generated by electrical currents in the heart.
- These are used in the **memory components of computers** and **fast digital circuits** (including those based on Josephson junctions and rapid single flux quantum technology).
- **Transportation:** powerful superconducting electromagnets used in **maglev trains**, magnetic confinement fusion reactors (e.g. tokamaks), and magnets used in particle accelerators
- **Transforming the Electricity Grid:** Superconductor technology provides loss-less wires and cables and improves the reliability and efficiency of the power grid. It saves power and with it the financial savings and the environmental benefits also accrue
- **Medical diagnosis:** One of the first large-scale applications of superconductivity is in medical diagnosis. **Magnetic resonance imaging, or MRI**, uses powerful superconducting magnets to produce large and uniform magnetic fields inside the patient’s body.
- Superconductors are also being employed for **undersea communication, submarine detection and geophysical prospecting**
- **high sensitivity particle detectors, including the transition edge sensor, the superconducting bolometer, the superconducting tunnel junction detector, the kinetic inductance detector, and the superconducting nanowire single-photon detector**
- **rail gun and coilgun magnets**
- **electric motors and generators**

Significance of Superconductivity at room temperature:

- Superconductivity is a phenomenon that, so far, has been possible only at extremely low temperatures, in the range of 100°C below zero.
- In recent years, scientists have been able to find superconductive materials at temperatures that are higher than absolute zero but, in most cases, these temperatures are still below -100°C and the pressures required are extreme.
- Creating such extreme conditions of temperature and pressure is a difficult task.
- The search for a material that exhibits superconductivity at room temperature, or at least manageable low temperatures, has been going on for decades, without success.
- Indian scientists have invented a material using silver nanoparticles embedded in a gold matrix that exhibited superconductivity in room temperature.
- If the claimed discovery were confirmed, it could be one of the biggest breakthroughs in physics in this century so far.

Conclusion:

- Technical barriers have till now hindered the large scale usage of superconductivity phenomenon. With the new discovery, the true potential of super-conductivity can be reached out for socio-economic development of the country.

Topic: Conservation, environmental pollution and degradation, environmental impact assessment

Q) Necessity to view sustainable development from the prism of interest of flora and fauna and not just from the standpoint of human beings is the need of the hour. Discuss. (250 words)

Epw

Why this question:

The article brings out the case study of Reintroduction of the Asiatic Lion and amidst

Key demands of the question:

The answer should discuss the statement and need for eco centric approach.

**Directive:**

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

One can start by bringing out the need for such an approach in the current times.

Body:

Answer to the question should highlight the significance of eco-centric approach, necessity to view sustainable development from the prism of interest of flora and fauna and not just from the standpoint of human beings. Specifically with respect to the concept of eco-centrism. One can take hints from the article and discuss the SC verdicts in detail and suggest your opinion in a balanced way.

Conclusion:

Conclude with significance of such conservation efforts.

Introduction:

- The recent controversy over the shifting of mugger crocodiles from their habitat near the Statue of Unity in Gujarat for tourist “safety,” has generated controversy. It is not clear as to whether the legal procedures under the provisions of the Wildlife (Protection) Act, 1972 were followed or not.
- However, the eagerness of the Gujarat government to shift the crocodiles on the presumption that it will cause danger to tourists, is to be contrasted with its vehement opposition to the shifting of few endangered Asiatic lions from Gujarat to a proposed second home in Kuno–Palpur Wildlife Sanctuary in Madhya Pradesh (MP).
- The reluctance of Gujarat to part with Asiatic lions assumes a serious dimension in view of the death of a sizeable number of lions due to the outbreak of suspected canine distemper.

Body:

- The Supreme Court in *Centre for Environmental Law v Union of India* 2013 ruled that Eco-centrism is nature-centred, where humans are part of nature and non-humans have intrinsic value. In other words, human interest does not take automatic precedence and humans have obligations to non-humans independently of human interest. Eco-centrism is, therefore, life-centred, nature-centred where nature includes both humans and non-humans.
- The principle of eco-centrism was relied upon by the Court in highlighting the importance of protecting the fauna and flora
- Sustainable Development and Intergenerational equity presume the superior needs of individuals and distribute the use of natural resources in such a way that it must be fairly conveyed between the present and future generations.

The need for eco-centrism:

- **In ethical terms:** ecocentrism expands the moral community (and ethics) from being just about ourselves. It means we are not concerned only with humanity; we extend respect and care to all life, and indeed to terrestrial and aquatic ecosystems themselves.
- **In evolutionary terms:** ecocentrism reflects the fact *Homo sapiens* evolved out of the rich web of life on Earth – a legacy stretching back an almost unimaginable 3.5 billion years.
- **In spiritual terms:** Many people and some societies have developed ecocentric moral sentiments. There is increasing evidence that ecocentric values are being fused into nature-based, ecocentric spiritualities, many of which are innovative and new. With such spiritualities, even people who are entirely naturalistic in their worldviews, often speak of the Earth and its ecosystems as ‘sacred’ and thus worthy of reverent care and defence
- **In ecological terms:** ecocentrism reminds us that all life is interdependent and that both humans and nonhumans are absolutely dependent on the ecosystem processes that nature provides. An anthropocentric conservation ethic alone is wholly inadequate for conserving biodiversity.

Conclusion:

- The shift has been gradual but steady, but there is still a long way to achieve absolute eco-centrism, if they intend to do so.
- It is imperative that the government and the people realise that the flora and fauna should be at the center of sustainable development for the latter to be successful.

Q) Discuss the potential impact of climate change of world food production. (250 words)

Reference

Why this question:

The article brings out how Climate change is adversely affecting the production of key crops such as wheat and rice, with some countries faring far worse than others.

Key demands of the question:

The answer should evaluate the effect of climate change of world food production.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Discuss briefly the issue of Climate change on a larger picture.

Body:

Answer is straightforward and must discuss the impact of climate change on world food production. Take cues from the article and discuss the impact in detail on different parts of the world.

Conclusion:

Conclude with what should be the solution, what needs to be done.

Introduction:

- Food is one of society's key sensitivities to climate. A year of not enough or too much rainfall, a hot spell or cold snap at the wrong time, or extremes, like flooding and storms, can have a significant effect on local crop yields and livestock production.
- Climate change is adversely affecting the production of key crops such as wheat and rice, with some countries faring far worse than others. This is as per research, published in the journal PLOS ONE.

Body:

- The impacts of climate change on global food production are mostly negative in Europe, Southern Africa, and Australia, generally positive in Latin America, and mixed in Asia and Northern and Central America. The study found that about half of all food-insecure countries are experiencing decreases in crop production — and so are some affluent industrialised countries in Western Europe.

Crops:

- The world's top 10 crops — barley, cassava, maize, oil palm, rapeseed, rice, sorghum, soybean, sugarcane and wheat — supply a combined 83 per cent of all calories produced on cropland. Yields have long been projected to decrease in future climate conditions.
- Studies observed that climate change causes a significant yield variation in the world's top 10 crops, ranging from a decrease of 13.4 per cent for oil palm to an increase of 3.5 per cent for soybean, and resulting in an average reduction of about one per cent of consumable food calories from these top 10 crops.
- Crops like soybean and gram are likely to benefit from higher level of CO₂ in atmosphere, which helps in CO₂ fertilisation
- A recent study of global vegetable and legume production concluded that if greenhouse gas emissions continue on their current trajectory, yields could fall by 35 percent by 2100 due to water scarcity and increased salinity and ozone.
- Another new study found that U.S. production of corn (a.k.a. maize), much of which is used to feed livestock and make biofuel, could be cut in half by a 4°C increase in global temperatures—which could happen by 2100 if we don't reduce our greenhouse gas emissions.

Other food products:

- Climate change will not only affect crops—it will also impact meat production, fisheries and other fundamental aspects of our food supply.
- Heat waves, which are expected to become more frequent, make livestock less fertile and more vulnerable to disease. Dairy cows are especially sensitive to heat, so milk production could decline.
- 540 million people around the world rely on fish for their protein and income—but seafood will be impacted by climate change, too.
- Warmer waters can alter the timing of fish migration and reproduction, and could speed up fish metabolism, resulting in their bodies taking up more mercury.

- Aquaculture of fresh water species is also affected by sea level rise as saltwater can move upstream in rivers. For example, in the Mekong Delta and Irawaddy region of Vietnam and Myanmar, the booming catfish aquaculture could be affected by saltwater intrusion.

Rising Diseases:

- Climate change will also enable weeds, pests and fungi to expand their range and numbers. In addition, earlier springs and milder winters will allow more of these pests and weeds to survive for a longer time.
- For example, new virulent mutant strains of wheat rust, a fungal infection that had not been seen for over 50 years, have spread from Africa to Asia, the Middle East and Europe, devastating crops.

Economic losses:

- The world population is expected to grow to almost 10 billion by 2050. With 3.4 billion more mouths to feed, and the growing desire of the middle class for meat and dairy in developing countries, global demand for food could increase by between 59 and 98 percent.
- Immediate impact on supply, causing price shocks and volatility that spread across sectors and borders.
- A severe summer drought in 2012 reduced shipping traffic on the Mississippi River, a major route for transporting crops from the Midwest. The decrease in barge traffic resulted in significant food and economic losses. Flooding which followed in the spring caused additional delays in food transport.

Groundwater:

- Groundwater depletion is a slow-building pressure on our food system.
- About 10 percent of the crops grown in the world's major food production regions are irrigated with groundwater that is non-renewable.
- Aquifers are being drained faster than they're refilling—a problem which will only get worse as the world continues to heat up.
- This is happening in major food producing regions such as the U.S. Great Plains and California's Central Valley, and in Pakistan, India, northeastern China, and parts of Iran and Iraq.

Impacts on India's agriculture profile due to climate change:

- India is fortunate to have the monsoon, but it is also uniquely vulnerable to rising temperatures.
- India is ranked **14th on the Global Climate Risk Index 2019**.
- With **rain-fed agriculture** practised in **over 67% of our total crop area**, weather variability can lead to heavy costs, especially for coarse grains (which are mostly grown in rain-fed areas).
- According to one estimate, they may face a **24-58% decline in household income** and **12-33% rise in household poverty** through exacerbated droughts.
- India has **over 120 million hectares suffering from some form of degradation**.
- Rise in average temperatures would significantly impact our kharif crops.
- Any significant decline in summer rains would devastate Indian agriculture. Climate change related phenomena have consequences, especially for marginal farmers.
- They potentially face a huge decline in household income and rise in household poverty through exacerbated droughts.

Way forward:

- Enhancing the resilience of agriculture to cope with the climate change and the climate variability.
- Increasing area under permaculture could result in a total reduction of gigatons of CO₂, from both sequestration and reduced emissions.
- Applying Farm yard Manure, compost or by practising organic farming to improve the soil organic matter which can help in improvement of soil health.
- Develop climate-smart agriculture practices.
- Adoption of Zero Budget Natural Farming (ZBNF) and Organic farming.
- Building on the current crop insurance program, weather-based models and technology need to be used to determine losses and compensate farmers within weeks (Kenya does it in a few days).
- Farmers, especially smallholder farmers, need advance warning of emergent weather conditions at local level.
- Farmers can adapt to climate changes by shifting planting dates and choosing varieties with different growth duration.
- Interventions related to soil health, water harvesting, improved drainage in flood prone area, artificial ground water recharge and water saving irrigation methods.
- An Early warning system should be put in place to monitor changes in pest and disease outbreaks.
- Promoting Drought / temperature tolerant varieties and water saving paddy cultivation methods (System of Rice Intensification (SRI)).

- Investment in R&D is needed to spur innovations in sustainable climate-friendly and climate-proof productivity, and the private sector can help on this.

Q) The Indian fertiliser industry has overlooked the aspects related to environmental pollution, while making improvements in energy efficiency. Critically analyse the statement while suggesting solutions to the problems. (250 words)

Reference

Why this question:

The article captures the pollution caused by the fertiliser industry in detail, it emphasises on the need for a relook at the industry. The industry has been classified under the 'red category' of polluting sectors by the Central Pollution Control Board

Demand of the question:

This question seeks to examine the pollution causing factors of the fertilizer industry

Directive word:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Start with brief introduction on the fertilizer industry.

Body

Discussion to the answer must state the factors of pollution that the industry is causing, take cues from the article to discuss various reasons that are causing pollution. Cover multiple aspects and suggest what needs to be done.

Conclusion

Conclude with what needs to be done.

Introduction:

- Indian soils are generally deficient in nitrogen, phosphorus and potassium and do not give high yields. It is, therefore, essential to feed these soils with chemical fertilizers so that their productivity increases. The significant contribution made by the chemical fertilizers can be seen from the impact of the Green Revolution on Indian agriculture. The health and growth of the fertilizer industry is vital for increasing the growth of agricultural sector, to meet the food-grain requirements of increasing population as well as increasing contribution to exports.
- The industry has been classified under the 'red category' of polluting sectors by the Central Pollution Control Board

Body:

Indian Fertiliser industry:

- Fertilizer as an industry is under the control of the Union Government. Urea dominates the sector.
- It is the most produced (86%), the most consumed (74%) and the most imported (52%).
- India's produces about 80 percent of its Urea fertilizer needs.
- And the fertilizer industry has the capacity to indigenously meet 50 percent of the country's phosphatic fertilizers.
- But India still depends heavily on imports for the raw ingredients for its phosphatic and potassium fertilizers.
- The public sector undertakings are playing a dominant role in manufacturing chemical fertilizers.
- At present, there are 11 public sector undertakings under the administrative control of Department of Fertilizers.
- A number of private companies are also engaged in manufacturing fertilizers. E.g.: IEL (Kanpur), SRC (Kota), D.C.M. (Delhi) etc.

Factors of pollution that the industry is causing:

- A study conducted by the Centre for Science and Environment, a New Delhi-based non-profit, under its Green Rating Project (GRP) revealed the dismal state of pollution control by industries.
- Out of 52 per cent plants, assessed in the study, 12 plants received directions or show cause and even closure notices for water pollution and air pollution or solid waste mismanagement.
- There are relaxed norms for the discharge of untreated or partially treated industrial wastewater and emission of air pollutants.
- Management of solid wastes, particularly hazardous waste was also found to be poor.

- Pollutant standards for the sector were revised in 2017, but are still relaxed compared to international standards.
- Nitrogen becomes a pollutant when it escapes into the environment and reacts with other organic compounds.
- Nitrogen compounds running off farmland have led to water pollution problems around the world, while nitrogen emissions from industry, agriculture and vehicles make a big contribution to air pollution.
- While most plants are meeting the particulate matter (PM) standards, inefficient air pollution control devices or improper fuel combustion within the systems have led to high emission levels at some plants.
- There is also no regulation in India for parameters like emissions of gaseous ammonia from urea manufacturing,

Measures needed:

- There is an urgent need for stricter compliance check systems and enforcement of norms.
- The momentum for these changes has to be created through robust policies.
- State Governments and Central Government need to work in tandem to encourage farmers for ecological farming.
- Farmers have to be educated and taught to change their cropping pattern and move to multiple cropping.
- Use of bio-fertilisers should be encouraged.
- There is also a need to shift from fossil fuel based to renewable energy based fertiliser plants.

Conclusion:

- Fertilisers are inevitable in our food security and economy as almost half of population is dependent on it.
- The need of the hour is for better regulation and sustainable ways of producing and using fertilisers which is in sync with SDG 12 (Responsible Consumption and Production).

Q) What do you understand by desertification? List down its causes. Also evaluate the role played by United Nations Convention to Combat Desertification (UNCCD) so far in addressing the concerns posed by desertification world across. (250 words)

Reference

Why this question:

World Day to Combat Desertification and Drought was observed on June 17, 2019 with the theme “Let’s grow the future together”. Thus, it is important for us to evaluate the theme.

Key demand of the question:

One has to discuss in detail the concept of Desertification, causes and the concerns posed by it and then evaluate the role played by UNCCD in addressing these concerns so far.

Directive:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer:

Introduction:

Begin with brief introduction on the background of the question.

Body:

Discussion should include the following:

- Desertification according to United Nations: Desertification is the degradation of land in arid, semi-arid and dry sub-humid areas. Desertification does not refer to the expansion of existing deserts.
- Causes: It is caused primarily by human activities and climatic variations. It occurs because dryland ecosystems, which cover over one third of the world’s land area, are extremely vulnerable to overexploitation and inappropriate land use.
- Global scenario: According to United Nations, every year, the world loses 24 billion tons of fertile soil and dryland degradation reduces national domestic product in developing countries by up to 8 % annually.
- Goal 15 of the 2030 Agenda for Sustainable Development states our resolve to halt and reverse land degradation.
- Suggest solutions – as to what needs to be done?

Conclusion:

Conclude with way forward.

Introduction:

- Desertification is **the degradation of land in arid, semi-arid and dry sub-humid areas. It is caused primarily by human activities and climatic variations.** Desertification does not refer to the expansion of existing deserts.
- It occurs because dryland ecosystems, which cover over one-third of the world's land area, are extremely vulnerable to **overexploitation and inappropriate land use. Poverty, political instability, deforestation, overgrazing and bad irrigation practices** can all undermine the productivity of the land

Body:

Main reasons that cause desertification in India are:

- **Water erosion (10.98 per cent).**
- **Wind erosion (5.55 per cent).**
- **Human-made/settlements (0.69 per cent).**
- **Vegetation degradation (8.91 per cent).**
- **Salinity (1.12 per cent).**
- **Others (2.07 per cent).**

United Nations Convention to Combat Desertification (UNCCD) was established in 1994, the sole legally binding international agreement linking environment and development to sustainable land management. The Convention addresses specifically the arid, semi-arid and dry sub-humid areas, known as the drylands, where some of the most vulnerable ecosystems and peoples can be found.

UNCCD Estimate of Desertification:

- **Land & Drought:**
 - By 2025, 1.8 billion people will experience absolute water scarcity, and 2/3 of the world will be living under water-stressed conditions.
 - A complex and slowly encroaching natural hazard with significant and pervasive socio-economic and environmental impacts to cause more deaths and displace more people than any other natural disaster.
 - India has witnessed increase in the level of desertification in 26 of 29 states between 2003-05 and 2011-13, according to the State of India's Environment (SoE) 2019 in Figures.
- **Land & Human Security:**
 - By 2045 some 135 million people may be displaced as a result of desertification.
 - Achieving land degradation neutrality -by rehabilitating already degraded land, scaling up sustainable land management and accelerating restoration initiatives- is a pathway to greater resilience and security for all.
- **Land & Climate:**
 - Restoring the soils of degraded ecosystems has the potential to store up to 3 billion tons of carbon annually.
 - The land use sector represents almost 25% of total global emissions. Its rehabilitation and sustainable management are critical to combating climate change.

Measures undertaken by UNCCD:

- **UNCCD 2018-2030 Strategic Framework:** It is the most comprehensive global commitment to achieve Land Degradation Neutrality (LDN) in order to restore the productivity of vast expanses of degraded land, improve the livelihoods of more than 1.3 billion people, and reduce the impacts of drought on vulnerable populations to build.
- The Convention's 197 parties work together to improve the living conditions for people in drylands, to maintain and restore land and soil productivity, and to mitigate the effects of drought.
- The UNCCD is particularly committed to a bottom-up approach, encouraging the participation of local people in combating desertification and land degradation.
- The UNCCD secretariat facilitates cooperation between developed and developing countries, particularly around knowledge and technology transfer for sustainable land management.
- As the dynamics of land, climate and biodiversity are intimately connected, to meet these complex challenges with an integrated approach and the best possible use of natural resources.
- The UNCCD collaborates closely with the other two Rio Conventions: The Convention on Biological Diversity (CBD) and The United Nations Framework Convention on Climate Change (UNFCCC).

**Way forward:**

- Setting up of an Intergovernmental Panel on Land and Soil will be very helpful in speeding up efforts to check desertification.
- Developing countries need to integrate their poverty eradication programmes with strategies to fight desertification.
- Lessons from the world:
 - In Africa, several countries have come together to form a 12,000 sq.km “great green wall” extending from Senegal to Djibouti with the participation of local communities.
 - People’s participation is crucial in reclaiming lands. China’s “great green wall” project is on a massive scale and is now starting to show results.
- The techniques include agro-forestry and farmer-managed natural regeneration. Small community initiatives like
 - Closure of degraded lands for grazing
 - Curtailing farming
 - Growing fast-growing plants
 - Raising tall trees that serve as a barrier against winds and sandstorms are very effective.
- National governments could consider building large green belts, prioritise forestry programmes and launch projects of fixing and stabilising sands.

Conclusion:

- The desertification is being accentuated by climate change. Thus, a comprehensive sustainable developmental approach is needed by the countries.

Q) Discuss the possible relationship between climate change and hunger. (250 words)Reference***Why this question:***

The question is to analyse the impact of climate change on global hunger

Key demand of the question:

One has to analyse how and why climate Change Is Driving Global Hunger.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:***Introduction:***

Begin with brief introduction on what you understand by Hunger.

Body:

Discussion should include the following:

- Quote reports like – Climate Change is among the leading causes of rising global hunger according to a new report released by the UN’s Food and Agricultural Organization (FAO).
- Extreme weather events, land degradation and desertification, water scarcity and rising sea levels all indicate how climate change already undermines global efforts to eradicate hunger.
- Explain how the two things are inter related, what are the dependencies? What needs to be done?

Conclusion:

Conclude that If we are to achieve a world without hunger and malnutrition in all its forms by 2030, it is imperative that we accelerate and scale up actions to strengthen the resilience and adaptive capacity of food systems and people’s livelihoods in response to climate variability and extremes.

Introduction:

- According to the United Nations’ annual food security report 2018, World hunger has risen for a third consecutive year. Climate Change is among the leading causes of rising global hunger. 60 million people are facing a food crisis but the public has not heard about it.
- The 2015/16 ‘super El Niño’, combined with climate change, brought severe droughts and flooding to people in the Horn of Africa, Southern Africa, Central America, Asia, the Caribbean and the Pacific. 31.1m people are currently food insecure in the Horn of Africa.

**Body:****Relationship between climate change and hunger:**

- Agriculture is one of the industries most exposed and vulnerable to climate change.
- Crops and livestock are extremely sensitive to temperature and precipitation.
- A late spring frost can be devastating, and a heat wave during the flowering stage can result in sharply reduced yields.
- With climate change, people face shortage of water and food, resulting in increased competition to access these basic necessities. This increases the chances of the intensification of existing conflicts and also creates new ones.
- In the Democratic Republic of Congo, shifts in the timing and patterns of rainfall have led to lower food production and greater competition on arable land, increasing ethnic tensions and conflicts in the country. Such conflicts affect the poor the most, and further lead to an increase in poverty and displacement, pushing people into a vicious trap.
- Frequent floods and droughts caused by climate change lead to food shortages and rise in food prices. This causes hunger and malnutrition, the effects of which are felt most strongly by the poor.
- Floods and droughts brought on by climate change threaten food production and supply. As a result, the price of food increases, and access becomes more and more limited, putting many at higher risk of hunger.
- Rising sea levels, extreme weather events and prolonged drought force millions of people to move away from home every year in search of food, water and jobs.
- Gradual changes brought on by deforestation, overgrazing and drought slowly transform pastures to dust, destroy crops and kill livestock, effectively challenging the livelihoods of millions of farmers
- Meat consumption alone accounts for an estimated 22 percent of global water use, and this need will increase in a hotter world.
- Even seemingly disparate factors like international trade are affected by climate change, with serious ramifications for food security

India's risk profile due to climate change:

- India ranks fifth globally for the losses it has experienced due to climate change
- Around 800 million people in the country live in villages and depend on agriculture and natural resources for their livelihoods. With at least 50% of the farmlands in the country being rain-fed, changes in the pattern of the monsoons will affect their livelihoods the most.
- There has been a recorded decline in monsoon rainfall levels since 1950. And it is suspected that 2°C rise in world's temperature will make India's monsoon even more unpredictable. Change in Monsoon could flood certain states in India, while some other states may witness frequent droughts.
- Climate change will make the existing problems of poverty, malnutrition, and farmer suicides worse.
- Due to climate change, 15% of India's groundwater resources are damaged, and falling water table is suspected to deal a severe blow in progress of agriculture.
- Rising sea-level and surges of storm would also impact agriculture, degrade groundwater quality, increasing the risk of contamination in water, and giving rise to diarrhoea and cholera.
- Also rising carbon dioxide levels due to global warming is suspected to shrink down the amount of protein in crops like rice and wheat, which are primary food source for majority of the population in the drought leaving populations at risk of malnutrition, low immunity and raising the risk of diseases affecting the population severely.
- There will be manifold increase in the severe heatwave frequency and affecting the crops, food delivery system etc.

Way forward:

- **Curbing food loss, improving nutrition and promoting sustainable production systems** must be prioritized.
- Food-producing nations will need creative policies and new technologies to meet these challenges successfully.
- The efforts should include reforestation which would reduce the impact of extreme events fuelled by warming of the surrounding oceans and neighbouring lands.
- To limit global warming, countries will have to **change policies in sectors like land, energy, industry, buildings, transport, and urban development.**
- **Limiting global warming to 1.5 degree** compared with 2 degree would reduce challenging impacts on ecosystems, human health and well-being, making it easier to achieve the United Nations Sustainable Development Goals.

- When historical knowledge no longer works, farmers must rely on other sources of information, such as **meteorologists, agronomists and other scientists**, as well as the **development of new sustainable technologies**.
- **Public funding for agricultural research and development** must be increased and the developed countries must transfer the technology to the developing and low-income nations.
- **Precision agriculture** can leverage computers, global positioning systems, geographic information systems and sensors to provide the data necessary to give each tiny parcel of land on a field exactly the inputs it needs.
- And a resurgent interest in the use of the time-honoured technology of **cover crops** may mitigate climate change impacts.
- **Nanotechnologies** can also help improve how fertilizers and pesticides are released. By putting chemical inputs into tiny capsules or in gels, it is possible to control when and how these inputs are released to make them more effective, and at the same time reduce chemical emissions and runoff.

Conclusion:

- In short, **agriculture is the “Goldilocks industry”** — the weather should not be too hot or too cold, and rainfall must be “just right.” Producing enough food for everyone in the world depends heavily on climate.
- This means that it will be impossible to curb hunger without preparing for and adapting to climate change.
- People must wield their social power to encourage mitigation of climate change and promote investments in technologies for adaptation. We need everyone at the table contributing to a food-secure future.

Q) The Indian Forest Act, 1927 (IFA), is proposed to be amended. Can we conclude that the forest sector in India is waking up to the much-needed reforms ? Critically analyse. (250 words)

[Livemint](#)

Why this question:

The question is to discuss the recent forest reforms that are being brought to the table. And evaluate if the reforms are in the right direction.

Key demand of the question:

Evaluate the current forestry reforms being taken by the government and critically analyse if they are able to meet the intent.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with brief introduction on details of the Indian Forest Act.

Body:

Discussion should include the following:

Take cues from the article and discuss how IFA was a tool for a colonial takeover of India’s forests. The IFA created two main legal categories of forests—reserved forest (RF) and protected forest (PF)—and empowered the forest departments (FDs) to take over, manage and protect them. It was implicitly for timber and softwood production.

Then move on to discuss what are the issues of continuing the same system? What are we failing in?

Explain the relevance and coming of Forest Rights Act of 2006.

What are the current concerns associated to it?

Conclusion:

Conclude by reasserting the need for better reforms and need for the right direction.

Introduction:

- The Ministry of Environment, Forest and Climate Change (MoEF&CC) has finalized the first draft of the process of “comprehensively amending” the backbone of forest governance in India—the Indian Forest Act, 1927 (IFA).
- The Indian Forest Act was enacted in 1927 to ‘consolidate the law related to forest, the transit of forest produce, and the duty liable on timber and other forest produce’.

**Body:**

- There has been a severe decline in the forest cover of the country mainly because of large-scale diversion of forest lands for agriculture, diversion for “development” projects and regularisation of encroachments by state governments.

Many reports like the **MB Shah report of 2010** and the **TSR Subramanian report of 2015**, have talked about amending the IFA. Thus, the **IFA amendment Act is a new lease of life** with the **following new provisions**:

- New definitions of Forest and Community in line with changing environmental, socio-economic and political scenario.
- The amendment has increased the focus to conservation, enrichment and sustainable management of forest resources and matters connected therewith to safeguard ecological stability.
- It addresses the concerns related to climate change and international commitments.
- **More Power to forest officers** under Section 66(2) of the Indian Forest (Amendment) Act forest-officer, may if necessary, use firearms for securing of the forest-produce.
- The Union government has proposed that the Centre will be able to intervene in the states on matters of management of forestlands, overruling the states on several counts when it deems fit.
- The amendment introduces a new category of forests — production forest. These will be forests with specific objectives for production of timber, pulp, pulpwood, firewood, non-timber forest produce, medicinal plants or any forest species to increase production in the country for a specified period.
- It provides for empowering the state governments to levy cess upto 10% of value assessed of mining products removed from the forests and water used for irrigation or on industries. The cess shall be used exclusively for reforestation, forest protection and other purposes connected with the tree planting, forest development and conservation.
- The proposed amendments also stated that the state government “may recognise and notify private forest at the request of the owner” if the forest is used primarily for environmental conservation and preservation including, protecting water catchments
- It also defines the procedure to be followed for declaring an area to be a Reserved Forest, a Protected Forest or a Village Forest.
- It defines what a forest offence is, what are the acts prohibited inside a Reserved Forest, and penalties leviable on violation of the provisions of the Act.

However, there are a few concerns with the Draft IFA:

- **Clash with Forest Rights Act:** The exclusion of ‘village forestry’ from the preview of Forest Right Act (forest official supersedes gram sabha) is legally contradictory and would add confusion on the ground
- **Give more power to forest officials:** The draft Bill reinforces the idea of bureaucratic control of forests, providing immunity for actions such as use of firearms by personnel to prevent an offence. Critics argue that this would turn quarter of India’s land into police state.
- **Definition of forest:** Various national and international agencies such as FAO, CBD, UNFCCC and FSI have adopted the definition of forest that account density and area under tree as the basis of definition. While proposed amendment consider only administrative needs and ignores ecological parameters while defining forest.
- **Forced relocation of forest dwellers:** The draft mentions that the state governments could take away the rights of the forest dwellers if the government feels it is not in line with “conservation of the proposed reserved forest” by payment to the people impacted or by the grant of land

Conclusion:

- India’s forests play a key role in moderating the lives of not just the adivasis and other traditional dwellers, but everyone in the subcontinent, through their impact on the climate and monsoons.

Topic: Disaster and disaster management.

Q) What are heat waves and how are they classified ? Discuss the effects of heatwaves on health, environment and economy and suggest how should India be prepared ? (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The Article discusses in what way heat-wave action plans can help city administrations cope with the worst of summer.

Key demand of the question:

The answer must explain what are heat waves, the causes of heatwaves, effect of heatwaves on health, environment and economy. Also one has to elaborate on the steps that are required to be taken in Indian context.

Directive word:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Begin with a definition of what you understand by heatwaves.

Body:

The answer must discuss the following:

- Heat wave is considered if maximum temperature of a station reaches at least 40°C or more for Plains, 37°C or more for coastal stations and at least 30°C or more for Hilly regions.
- Discuss the criteria used to declare heat wave.
- Explain the causes and consequences, health impacts of Heat Waves, on economy, environment etc.
- Quote reasons – why India is experiencing more heat waves, what needs to be done?
- Conclude with way forward.

Conclusion:

Conclude with solutions to overcome the challenge.

Introduction:

- Heat wave is a period of abnormally high temperatures, more than the normal maximum temperature that occurs during the pre-monsoon (April to June) summer season.
- According to Indian Meteorological Department, Heat wave is considered if maximum temperature of a station reaches at least 40°C or more for Plains, 37°C or more for coastal stations and at least 30°C or more for Hilly regions.

Body:

Effects:

Social:

- Heatwaves are associated with increased rates of heat stress and heat stroke, worsening heart failure and acute kidney injury from dehydration.
- Children, the elderly and those with pre-existing morbidities are particularly vulnerable.
- Promote the spread of diseases like cholera and dengue fever across endemic areas.
- Increased poverty due to failure of crops and reduced economic activities.

Economic:

- India lost nearly 75 billion hours of labour in 2017 as a result of rising temperatures.
- This made sustained work increasingly difficult and negatively affecting workers' output.
- The agriculture sector experienced the largest increase in labour loss.
- Almost 153 billion hours of labour were lost globally in 2017 due to heat, an increase of 62 billion hours from the year 2000.
- Agriculture sector was more vulnerable compared to the industrial and service sectors because workers there were more likely to be exposed to heat.
- Since 1990, every region of the globe has become steadily more vulnerable to extreme increases of heat.

State actions towards Heat waves assessing their geographic variations:

- Key element of many states response strategy has been enhancing health risk communications on the impact of heat waves and how citizens can take simple steps to reduce their exposure and protect their health.
- **Andhra Pradesh:**
 - Andhra Pradesh has strong inter-agency coordination across multiple departments
 - Andhra Pradesh has also set up 1168 stations approximately one for every hundred square kilometers for weather forecasting and modelling.
 - It has developed a mobile app to disseminate information about heat waves and advice on precautionary steps; the app is available in English and Telugu.
- **Telangana:**
 - Telangana developed one of the first state-wide heat action plans in 2016.

- The state is now integrating the heat action plan with its action plan on climate change.
- The Telangana plan focuses on training district officials and health staff
- **Odisha:**
 - It has declared heat waves as a state specific disaster.
 - It is developing local thresholds and analyzing vulnerability of communities in different parts of the state.
 - Odisha's activities focus on awareness raising, capacity building and training of healthcare staff, interagency coordination, and enabling provision of water for vulnerable communities.
- Various states and municipalities have introduced early warning systems, public awareness campaigns and increased training for medical professionals.
- Ahmedabad, Nagpur and Odisha have made pioneering efforts with respect to heat-health warning systems (HHWS).
- **Ahmedabad Municipal Corporation (AMC)** has adopted a heat action plan which necessitates measures such as building heat shelters, ensuring availability of water and removing neonatal ICU from the top floor of hospitals.
- Such warning systems include providing weather forecasts in advance, issuing warnings to people, providing readiness of emergency response systems, and preparing doctors and health facilities to handle a sudden influx of patients. Warnings facilitate people in taking appropriate actions against heat-related harm.
- Access to cool environments remains the mainstay of preventing heat stress:
 - In rural areas, where electricity access is a challenge, supplementing power supply of primary health centres with solar-based systems should be undertaken. Chhattisgarh, Maharashtra and Tripura have already deployed such systems.

Way forward:

- In 2016, the National Disaster Management Agency prepared guidelines for state governments to formulate action plans for the prevention and management of heat waves, outlining four key strategies:
 - Forecasting heat waves and enabling an early warning system
 - Building capacity of healthcare professionals to deal with heat wave-related emergencies
 - Community outreach through various media
 - Inter-agency cooperation as well as engagement with other civil society organizations in the region.
- Scientific Approach:
 - Climate data from the last 15-20 years can be correlated with the mortality and morbidity data to prepare a heat stress index and city-specific threshold.
 - Vulnerable areas and population could be identified by using GIS and satellite imagery for targeted actions.
- Advance implementation of **local Heat Action Plans**, plus effective inter-agency coordination is a vital response which the government can deploy in order to protect vulnerable groups.
- This will require identification of "**heat hot spots**", analysis of meteorological data and allocation of resources to crisis-prone areas.
- The **India Cooling Action Plan** must emphasize the urgency and need for better planning, zoning and building regulations to prevent Urban Heat Islands.
- **Provision of public messaging** (radio, TV), mobile phone-based text messages, automated phone calls and alerts.
- Promotion of traditional adaptation practices, such as staying indoors and wearing comfortable clothes.
- Popularisation of simple design features such as shaded windows, underground water storage tanks and insulating housing materials.

Q) "Fixing India's water crisis will need saner policies, meticulous strategy and a massive amount of public participation". Critically analyse. (250 words)

[Livemint](https://www.livemint.com)

Why this question:

The article discusses in detail the water woes that are unraveling in many parts of the country.

Key demand of the question:

The answer must address the methods and ways in terms of policies that are must required for addressing the water crisis across the country. One must discuss the need for systematic solutions.

**Directive:**

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:**Introduction:**

Begin with brief introduction on the current water crisis situation of the country.

Body:

- One must quote facts to depict the current water crisis situation facing the country. Studies warn that a seasonal drought is, in fact, a full-blown water crisis, accentuated by poor planning. Groundwater and sand extraction from river beds and basins has turned unsustainable, say many government and independent studies.
- Discuss the causative factors of such drought like conditions.
- What needs to be done at the planning and policy level?
- Take hints from the article, suggest solutions using case studies.

Conclusion:

Conclude with way forward.

Introduction:

- The **NITI Aayog report on Composite Water Management Index (CWMI)** said that India is facing its ‘worst’ water crisis in history. Taps in Shimla went dry in summer of 2018, posing an unprecedented water crisis in the hill town.
- Maharashtra and nearly half the country is facing drought and crippling water scarcity. Rains in 2018 in many parts were below normal with long gaps between rainy days. Our water crisis is turning more structural and stems from mostly man-made factors.

Body:**Current water crisis in India:**

- The annual per capita availability of water continues to decline sharply from about 5,177 cubic metres in 1951 to about 1,720 cubic metres in 2019.
- The NITI Aayog in its report on Composite Water Management Index (2018) has underlined that currently 600 million people face high to extreme water stress.
- Twenty-one cities, including Delhi, Bengaluru, Chennai and Hyderabad will run out of groundwater by 2020, affecting 100 million people.
- The rate of groundwater extraction is so severe that NASA’s findings suggest that India’s water table is declining alarmingly at a rate of about 0.3 metres per year.
- At this rate of depletion, India will have only 22 per cent of the present daily per capita water available in 2050, possibly forcing the country to import water.
- Dug-wells and borewells are constructed with alarming impunity to slide deeper and deeper to suck water from greater depths.
- Water is being diverted from food-crops to cash-crops; livelihoods to lifestyles; rural to urban—mismanagement is a bigger reason for the drought.
- Water shortages are hurting India’s ability to produce power and 40% thermal power plants are in areas facing high water stress, a recent World Resources Institute report says.
- Not only farmers, urban dwellers in cities and towns across India are also staring at a never seen before drinking water scarcity
- Residents in the arid Thar Desert of Rajasthan are spending Rs 2,500 to buy 2,500 litres of water which they share with their cattle.

Causative factors for water crisis:

- A combination of population explosion, unplanned growth of the city and its expansion to some traditional catchment areas (a region from which rainfall flows into a river, lake, or reservoir) have led to a reduction in the natural flow of water, and large-scale deforestation.
- Climate change, leading to much lower precipitation during the winter months. As a result, the natural flow and recharge of water in the region has fallen sharply
- Failure of State governments to check unplanned development and exploitation of water resources. There is no attempt at the central or state levels to manage water quantity and quality

- The vegetation pattern has changed, tree cover is shrinking and unscientific dumping of debris in water streams is rampant.
- The debris blocks the natural course of water bodies.
- Increasing number of tube wells resulting in depletion of groundwater.
- Changes in farming patterns lead to consumption of more water for irrigation and also change the soil profile because of the use of fertilizers
- The states ranked lowest like Uttar Pradesh, Haryana and Jharkhand – are home to almost half of India's population along with the majority of its agricultural produce.
- There is also a **lack of interest in maintaining India's traditional water harvesting structures**.

Measures needed to strengthen water Governance:

- India's priority must be:
 - To make our irrigation and water systems amenable to modern concepts.
 - To complete irrigation and water sector reforms.
 - To implement improved water management, governance and regulation practices.
 - Pricing system for water: For making people use water efficiently
- Deepen our understanding of our water resources and usage and put in place interventions that make our water use efficient and sustainable.
- Augmentation of watersheds that can store more good water, for use in agriculture and to serve habitations.
- Strict pollution control enforcement.
- **Decentralisation of irrigation commands**, offering higher financial flows to well-performing States through a **National Irrigation Management Fund**.
- Groundwater extraction patterns need to be better understood through **robust data collection**.
- Pollution can be curbed by levying suitable costs.
- Poor maintenance of pipelines, consistent leakage and illegal tapping of water are some of the issues that need to be addressed on a war-footing.
- Adopting rainwater harvesting techniques is the need of the hour.
- A legal mandate will work better than just competition and cooperation; it would make governments accountable.
- These forward-looking changes would need revamped national and State institutions, and updated laws.
- Urban India needs to focus on recycling and harvesting water, having better testing and purification facilities and increase public awareness on the need to conserve water.
- Large catchment areas need to be developed around water bodies so that natural recharge of groundwater takes place. A good example is the **Seog catchment area** which has been denoted as a wildlife sanctuary and where no construction is allowed.
- Greywater recycling, a method of recycling wastewater from kitchen sinks, showers and laundry fixtures.
- Greywater recycling helps reduce household water usage by about 50% .
- Comprehensive restructuring of India's Central Ground Water Board and the Central Water Commission in order to create a new 21st Century management authority.
- Right to water should mean a high priority to drinking water.
- This year's World Water Development Report makes it clear that nature-based solutions which are also aligned with the principles and aims of the 2030 Agenda for Sustainable Development can offer answers to our most pressing water-related challenges.

Conclusion:

- There is a need for credible environmental and cumulative impact assessments, genuine public consultation process at multiple stages of planning and project implementation, confidence-inspiring appraisal, which includes the appointment of independent experts, and most crucially, achieving some real monitoring and compliance.
- The **water governance** ought to be made **transparent, accountable and participatory** in every sub-sector, including management of rivers, groundwater, floods, and biodiversity, among others.

Q) Maharashtra is facing a water emergency of unprecedented proportions, in such conditions analyse how grave the water crisis is and what needs to be done to deal with the problem. (250 words)

Reference

Why this question:

The conversation in the show discusses in detail the water emergency that the State of Maharashtra is facing and highlights the urgency to look into the water crisis the country is witnessing.

Key demand of the question:

The answer must discuss the water crisis in detail and suggest what needs to be done to resolve the situation and address the issue in a sustainable manner.

Directive:

Analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary

Structure of the answer:

Introduction:

In a few introductory lines discuss the situation of water crisis currently being witnessed across the country.

Body:

In brief discuss the following aspects –

Following years of drought, the rivers' currents have ebbed, water in dams and reservoirs has depleted and over-exploitation of groundwater has raised concerns over the long-term availability of water.

Meanwhile media reports claim IT companies in Chennai are asking employees to work from home. The reason being they don't have water to sustain operations. It has not rained for almost 200 days in the city and Chennai may not get sufficient rain to tide over the water crisis for the next three months. In North India, residents in the arid Thar Desert of Rajasthan are dishing out Rs 2,500 to buy 2,500 litres of water which they share with their cattle.

With the threat of desertification staring Punjab in the face and the state struggling to break away from the 'wheat-paddy' cycle, farmers in the state are quickly adopting a five-decade-old scheme to use 'Underground Pipeline System' for irrigation.

The union government on its part has created a Jal Shakti Ministry under a full-fledged cabinet minister to try and address the water emergency, but a lot more needs to be done.

Thus conclude by analysing how grave the water crisis is and what needs to be done to deal with the problem.

Conclusion:

Conclude with what more needs to be done.

Introduction:

- Maharashtra is facing a water emergency of unprecedented proportions. Following years of drought, the rivers' currents have ebbed, water in dams and reservoirs has depleted and over-exploitation of groundwater has raised concerns over the long-term availability of water. Our water crisis is turning more structural and stems from mostly man-made factors.

Body:

- India receives 4000 bcm rainfall every year. Out of this, 1869 bcm is left after evaporation and the actual availability is 1137 bcm. There is a lot of temporal and spatial variation in the availability of this water. There are water surplus states and water scarce states like Maharashtra (Vidarbha, Beed), Karnataka, Tamil Nadu, Rajasthan, parts of Gujarat, Punjab and Haryana.

Issues with long term projects:

- Interlinking of rivers is a long-term project. It is almost 20 years now and the groundwork has not started for Ken-Betwa project. There is a lot of political opposition and there are ecological concerns as well. Half of the Panna tiger Reserve will be submerged.
- There are floods in Brahmaputra river at the time of monsoon but water is required in Assam during dry months.
- There is the problem of storage and transfer of water as well.

Major issues:

- Delay in monsoon and change in pattern.
- Management of both supply side and demand side of water.

- India's availability of water at present is 1700 cubic ft per person, which was 5000 cubic ft per person once upon a time.
- Unprecedented heat waves, which can become more persistent with climate change.
- Less pre monsoon rain.
- Reservoir levels are going down.
- 91 reservoirs in India are at 19% of their life storage.

Measures needed:

- India's priority must be:
 - To make our irrigation and water systems amenable to modern concepts.
 - To complete irrigation and water sector reforms.
 - To implement improved water management, governance and regulation practices.
 - Pricing system for water: For making people use water efficiently
- Centre, states, people and all stakeholders need to take action in this regard.
- Vigorous programmes on water efficiency are required like energy efficiency.
- There is an urgent need for coordination among users for aquifers. There should be laws and contracts for sharing of aquifers.
- Groundwater mapping has started recently in India.
- There should be a River Basin Authority for sharing information among states as most of the rivers in India pass through different states focusing on conservation.
- At the village level, there can be decentralized management of water at community level.
- Charging money for efficient use of water (as in case of electricity). For example- Water ATMS at Marathwada provide water @25 paisa per litre a day.
- Changing the cropping pattern, crop diversification and encouraging water use efficiency in agriculture by moving towards food crops from cash crops.
- Coordinated efforts among states for management of ground water at a localized level.
- Encouraging rain water harvesting, check dams
- Comprehensive restructuring of India's Central Ground Water Board and the Central Water Commission in order to create a new 21st Century management authority.
- Right to water should mean a high priority to drinking water
- India has so far seen the water sector in terms of irrigation projects or water schemes. We need to balance between our water-needs and that of the river itself.

Conclusion:

- Fixing India's structural water crisis will need a balanced combination of saner policies, meticulous strategy, and a massive amount of public participation.

Q) India faces a water crisis acute enough to cause popular unrest as it slowly assumes calamitous proportions. Discuss the causes that have led to such conditions and what needs to be done to address the situation on ground? (250 words)

[Livemint](#)

Why this question:

The article captures the water crisis currently that is prevailing in India. It points to the alarming crisis that may soon become a catastrophe.

Demand of the question:

The answer must discuss the underlying causes for such a crisis and analyse as to what needs to be done.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

Start with few facts explaining the water crisis situation in the country. India has only 4% of the planet's fresh-water for 16% of its population.

Body

One can have the following points in the answer:

Explain the crisis situation first, draw a map of India to depict the water crisis situation across the country.

Explain the root cause of such situation – falling Groundwater levels, India is the world's biggest groundwater extractor, All manner of structures have encroached upon lakes and rivers with impunity, while industrial waste and sewage inflows render various water bodies toxic. The problem is compounded by the large-scale adoption of thermocol and plastic plates and glasses even in the countryside, the stuff of non-biodegradable waste that ends up killing rural pools of water that have traditionally served entire villages etc.

Discuss what needs to be done to prevent the situation turning into a popular catastrophe.

Conclusion

Conclude with suggesting solutions, increased water harvesting techniques, scientific interventions for conservation of water is the need of the hour.

Introduction:

- The **NITI Aayog report on Composite Water Management Index (CWMI)** said that India is facing its 'worst' water crisis in history. Taps in Shimla went dry in summer of 2018, posing an unprecedented water crisis in the hill town.
- According to a forecast by the Asian Development Bank, India will have a water deficit of 50% by 2030. Recent studies also ranked Chennai and Delhi at the top of the 27 most vulnerable Asian cities in terms of low per-day water availability Mumbai and Kolkata follow close.

Body:

Current water crisis in India:

- India has only 4% of the planet's fresh-water for 16% of its population.
- The annual per capita availability of water continues to decline sharply from about 5,177 cubic metres in 1951 to about 1,720 cubic metres in 2019.
- The NITI Aayog in its report on Composite Water Management Index (2018) has underlined that currently 600 million people face high to extreme water stress.
- Twenty-one cities, including Delhi, Bengaluru, Chennai and Hyderabad will run out of groundwater by 2020, affecting 100 million people.
- The rate of groundwater extraction is so severe that NASA's findings suggest that India's water table is declining alarmingly at a rate of about 0.3 metres per year.
- At this rate of depletion, India will have only 22 per cent of the present daily per capita water available in 2050, possibly forcing the country to import water.

Causative factors for water crisis:

- A combination of population explosion, unplanned growth of the city and its expansion to some traditional catchment areas (a region from which rainfall flows into a river, lake, or reservoir) have led to a reduction in the natural flow of water, and large-scale deforestation.
- Climate change, leading to much lower precipitation during the winter months. As a result, the natural flow and recharge of water in the region has fallen sharply
- Failure of State governments to check unplanned development and exploitation of water resources. There is no attempt at the central or state levels to manage water quantity and quality
- The vegetation pattern has changed, tree cover is shrinking and unscientific dumping of debris in water streams is rampant.
- The debris blocks the natural course of water bodies.
- Increasing number of tube wells resulting in depletion of groundwater.
- Changes in farming patterns lead to consumption of more water for irrigation and also change the soil profile because of the use of fertilizers
- The states ranked lowest like Uttar Pradesh, Haryana and Jharkhand – are home to almost half of India's population along with the majority of its agricultural produce.
- There is also a **lack of interest in maintaining India's traditional water harvesting structures.**

Measures needed:

- India's priority must be:
 - To make our irrigation and water systems amenable to modern concepts.
 - To complete irrigation and water sector reforms.
 - To implement improved water management, governance and regulation practices.
 - Pricing system for water: For making people use water efficiently

- Deepen our understanding of our water resources and usage and put in place interventions that make our water use efficient and sustainable.
- Augmentation of watersheds that can store more good water, for use in agriculture and to serve habitations.
- Strict pollution control enforcement.
- **Decentralisation of irrigation commands**, offering higher financial flows to well-performing States through a **National Irrigation Management Fund**.
- Groundwater extraction patterns need to be better understood through **robust data collection**.
- Pollution can be curbed by levying suitable costs.
- Poor maintenance of pipelines, consistent leakage and illegal tapping of water are some of the issues that need to be addressed on a war-footing.
- Adopting rainwater harvesting techniques is the need of the hour.
- A legal mandate will work better than just competition and cooperation; it would make governments accountable.
- These forward-looking changes would need revamped national and State institutions, and updated laws.
- Urban India needs to focus on recycling and harvesting water, having better testing and purification facilities and increase public awareness on the need to conserve water.
- Large catchment areas need to be developed around water bodies so that natural recharge of groundwater takes place. A good example is the **Seog catchment area** which has been denoted as a wildlife sanctuary and where no construction is allowed.
- Greywater recycling, a method of recycling wastewater from kitchen sinks, showers and laundry fixtures.
- Greywater recycling helps reduce household water usage by about 50% .
- This year's World Water Development Report makes it clear that nature-based solutions which are also aligned with the principles and aims of the 2030 Agenda for Sustainable Development can offer answers to our most pressing water-related challenges.

Conclusion:

- There is a need for credible environmental and cumulative impact assessments, genuine public consultation process at multiple stages of planning and project implementation, confidence-inspiring appraisal, which includes the appointment of independent experts, and most crucially, achieving some real monitoring and compliance.
- The **water governance** ought to be made **transparent, accountable and participatory** in every sub-sector, including management of rivers, groundwater, floods, and biodiversity, among others.

Topic: Money laundering

Q) How does globalization impact money laundering ? Examine the recent policy efforts by the Government of India to address such problems. (250 words)

Reference

Why this question:

The question is to analyse the impact of globalisation on money laundering.

Demand of the question:

The answer must discuss the impact of globalization on money laundering.

Directive word:

Examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction

Start with brief description of the question's context.

Body

One can have the following points in the answer:

- Start the answer by drawing the link between money laundering and globalization.
- Briefly explain how globalization impacts money laundering.
- Examine the recent policy efforts taken by the government.

Conclusion

Conclude with way forward.

**Introduction:**

- Money laundering is a process where the proceeds of crime are transformed into apparently legitimate money or other assets. It is the processing of criminal proceeds to disguise its illegal origin. In simple words, it can be defined as the act of making money that comes from one source to look like it comes from another source. Money laundering is a single process however, its cycle can be broken down into three distinct stages namely, placement stage, layering stage and integration stage.

Body:**Impacts of globalization on money laundering:**

- Rapid developments in financial information, technology and communication allow money to move anywhere in the world with speed and ease.
- This makes the task of combating money-laundering more urgent than ever.
- The deeper “dirty money” gets into the international banking system, the more difficult it is to identify its origin.
- Because of the clandestine nature of money-laundering, it is difficult to estimate the total amount of money that goes through the laundry cycle.
- There have been a number of developments in the international financial system during recent decades that have made the three F’s-finding, freezing and forfeiting of criminally derived income and assets-all the more difficult.
- These are the “dollarization” (i.e. the use of the United States dollar in transactions) of black markets, the general trend towards financial deregulation, the progress of the Euromarket and the proliferation of financial secrecy havens.
- Fuelled by advances in technology and communications, the financial infrastructure has developed into a perpetually operating global system in which “megabyte money” (i.e. money in the form of symbols on computer screens) can move anywhere in the world with speed and ease.

Efforts of Government of India to address money laundering:

- In India, before the enactment of Prevention of Money Laundering Act, 2002 (PMLA) the major statutes that incorporated measures to address the problem of money laundering were:

PMLA Act:

- It prescribes obligation of banking companies, financial institutions and intermediaries for verification and maintenance of records of the identity of all its clients and also of all transactions and for furnishing information of such transactions in prescribed form to the Financial Intelligence Unit-India (FIU-IND).
- It empowers the Director of FIU-IND to impose fine on banking company, financial institution or intermediary if they or any of its officers fails to comply with the provisions of the Act as indicated above.
- PMLA envisages setting up of an Adjudicating Authority to exercise jurisdiction, power and authority conferred by it essentially to confirm attachment or order confiscation of attached properties.

The Black money (undisclosed foreign income and assets) and Imposition of Tax Act, 2015:

- To deal with the menace of the black money existing in the form of undisclosed foreign income and assets by setting out the procedure for dealing with such income and assets.

Benami Transactions (Prohibition) Amendment Bill, 2015:

- It aims to expand the definition of Benami Transactions and specifies the penalty to be imposed on a person entering into a Benami transaction.

Institutional framework:**Enforcement directorate:**

- PMLA empowers certain officers of the Directorate of Enforcement to carry out investigations in cases involving offence of money laundering and also to attach the property involved in money laundering.

Financial Intelligence Unit:

- It was established in India in 2004 as the central national agency responsible for receiving, processing, analyzing and disseminating information relating to suspect financial transactions.
- FIU-IND is also responsible for coordinating and strengthening efforts of national and international intelligence, investigation and enforcement agencies in pursuing the global efforts against money laundering and related crimes.
- FIU-IND is an independent body reporting directly to the Economic Intelligence Council (EIC) headed by the Finance Minister.

**Way forward:**

- Make common people more aware about the problem- The poor and illiterate people, instead of going through lengthy paper work transactions in Banks, prefer the Hawala system which needs to be stopped.
- Fulfilling the purpose of KYC Norms by doing proper KYC.
- Establishment of comprehensive enforcement agencies
- Promote cashless digital transaction

Topic : Cyber security; Role of media and social networking sites in internal security challenges.

Q) Historically, privacy was almost implicit, because it was hard to find and gather information. But in the digital world, we need to have more explicit rules. Discuss the need to control social media and the associated challenges. (250 words)

Livemint

Why this question:

The article discusses the recent US government's decision to press ahead with an antitrust probe against Big Tech firms has drawn the clout of these companies into the spotlight again. Investigators will put Facebook, Amazon, Apple and Google to scrutiny in an effort to check if they have abused their market dominance to stifle competition and hurt consumers.

Key demand of the question:

The answer must evaluate the need for controlling social media and the methods to ensure privacy concerns are addressed. One must explain how things have evolved historically with coming of the social media.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In a few introductory lines highlight the role of social media, the context of security involved along with it.

Body:

In brief discuss –

- Discuss how Social media is omnipresent in our lives and has a huge bearing on society and individuals.
- Explain that about 1.49 billion people on average log onto Facebook daily; every second, on average, around 6,000 tweets are tweeted on Twitter; and since its inception, over 40 billion photographs have been posted on Instagram. This is evidence of the huge presence of social media in our lives.
- Discuss the need for putting a control on the social media, why is it necessary and urgent.
- Explain what are the challenges involved , how to overcome them.

Conclusion:

Conclude with what needs to be done, suggest way forward.

Introduction:

- Social media plays an integral role in our lives today and has a huge bearing on society and individuals. Social media has revolutionized the way people communicate and socialize on the web. There is a positive effect on business, politics, socialization as well as some negative effects such as cyber-bullying, privacy, and fake news.

Body:

Recent developments:

- The US government's decision to press ahead with an antitrust probe against Big Tech firms has drawn the clout of these companies into the spotlight again.
- Investigators will put Facebook, Amazon, Apple and Google to scrutiny in an effort to check if they have abused their market dominance to stifle competition and hurt consumers.
- If such behaviour is proven, it would be unsettling, to say the least, given the widening use of social media and the privacy concerns it has thrown up.

**Need to control social media due to rising privacy concerns:**

- **Legitimate vs fake information:**
 - Challenge is how you permit what is considered legitimate content and information, and at the same time disallow the plethora of fake information as well as threats and abuse conveyed through these platforms.
 - There are questions raised whether to ban the medium or platform or content.
 - Rumours triggering lynchings and riots, data snooping etc.
- **Data theft and identity crisis:**
 - Data of millions are taken and used when only 270,000 people knowingly or unknowingly gave consent.
 - Individuals often share their data without being aware of it or understanding the implications of privacy terms and conditions.
 - Individuals do not have much control over the data they shared and personal data is considered as the new oil.
 - Individual users are increasingly viewed as legitimate targets for mining personal and metadata.
 - Such data can provide an intimate psychological profile including ideological preferences that together help campaign managers target communications and forecast voter behaviour.
- **Personal information collected:**
 - Fundamental business model of social media companies like Facebook poses some serious concerns.
 - Their goal is to collect as much personal information on individuals as possible and then use this information to sell highly targeted advertising to companies.
 - Worldwide there is very little understanding of what exactly they collected, little regulation and little known about the consequences on democracy.
 - This level of data collection represents the concentration of enormous power in the hands of a single corporation. The Cambridge Analytica scandal has highlighted how this power can be used by a small group of people with an agenda to foster polarisation, radicalisation and undermine democratic elections.
- **Other privacy issues:**
 - The tax authorities, for instance, have an eye out for lifestyles that may be disproportionate to declared sources of income.
 - Earlier this week, the US began asking visa applicants to submit details of their social media accounts.
 - The trolling of women has brought to the fore the disturbing reality of online violence and abuse women face in India.
 - Social media psychological profiles are being generated by tools designed to aid recruitment. Official scans by state agencies are on the rise, too.
- **Currently very difficult to control because:**
 - The number of users using social media platforms and internet are ever increasing and volume of traffic is huge.
 - The monopolistic tendency of a social media platform is all the more pronounced for the simple reason that its utility depends on connectivity: People have virtually no choice but to use the network that links everybody else they'd like to interact with.

Measures needed:

- Companies claim that they are merely distributing information. But the fact that they are near-monopoly distributors makes them public utilities and should subject them to more stringent regulation, aimed at preserving competition, innovation, and fair and open access.
- Recent laws directed at social media have that changing in Germany, social networks could pay up to \$60 million in fines if hate speech isn't removed within 24 hours.
- Social networks need to enhance their own governance, continue to refine the algorithms, use more "friction" like warnings and notifications for suspicious content expand human oversight, adjust advertising, and continue to share knowledge with other networks to reach those goals.
- India needs to have a legal framework for data protection. It will create a vital and necessary framework against which rights and responsibilities can be articulated, and digressions thereof evaluated.
- A proper data protection law with an effective enforcement mechanism would ensure recognition for India as a trustworthy global destination for data-based businesses and privacy-conscious consumers while also protecting the Right to Privacy of the people in India.

- Cyber law provisions need to be revised as the current approach of the Indian law is very narrow.
- International agreements form an important node in a web of solutions needed to address security and the rule of law in cyberspace. Given India's vision of a Digital India and considering the surge in cybercrime, it would be beneficial for India to join Budapest Convention
- Experts have pointed to the importance of aspects such as following basic cyber hygiene and a periodic review of the security facets of one's profile on various web platforms, especially on social media, where users tend to share personal information.
- When there are no legitimate security or public interest reasons, users should have the right to have their data destroyed.

Conclusion:

- Social media is a tool for empowerment, especially for a country like India where 70% of the population is yet to get online and leverage the opportunities it has to offer.
- While social media is definitely facing the privacy challenges, it is also enabling communities to access their rights and voice their opinion. Thus, there is a need to regulate it to get the best out of it for socio-economic development of society.

Q) Do you think the Indian government's intent towards data protection lie in favour data localisation? Critically analyse. (250 words)

[Indianexpress](#)

Why this question:

The article discusses why the Indian government intends in favor of data localization.

Key demand of the question:

One has to discuss the concept of data localization; Why government wants this? Concerns expressed by stakeholders and possible solutions.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with the concept of data localisation.

Body:

Explain the following points:

- What is the issue associated?
- What does data localization mean? – is a sensitive issue the world over and more so in India, given that this is a country of 1.3 billion people with over 1 billion mobile users. With technology developing rapidly, more and more devices becoming smarter and the Internet of Things taking over, a genuine concern around leakage of private data has gained ground.
- Explain why data localization is necessary for India? What are the policies that imply data localization?
- Discuss the concerns and challenges.

Conclusion:

Conclude with the fact that there is an urgent need to have an integrated, long-term strategy for policy creation for data localization.

Introduction:

- Data localisation refers to the process of storing data within the borders of a particular country where the data was generated.
- India's recent drafts and statements have strong signals for data localisation, which means that data of Indians, even if collected by an American company, must be stored and processed in India.
- Worldwide, the data flow debate is playing out at the World Trade Organisation (WTO) and G20.

**Body:****Importance of Data localization for India:**

- For securing citizen's data, data privacy, data sovereignty, national security, and economic development of the country.
- Much of the data from online sales, on ecommerce platforms is likely to be hosted and stored in US data firms.
- The extensive data collection by technology companies, has allowed them to process and monetise Indian users' data outside the country.
- To curtail the perils of unregulated and arbitrary use of personal data
- With the advent of cloud computing, Indian users' data is outside the country's boundaries, leading to a conflict of jurisdiction in case of any dispute.
- Data is a digital transactions footprint. During war or hostilities, data centres could be switched off. Such scenarios are pushing countries towards local infrastructure.

Yes, Data localization is needed in India due to:

- Data localisation will help Indian law enforcement agencies access data.
- RBI circular says that, it is important to have unfettered supervisory access to data stored in India.
- Localisation will help law enforcement access the data. Currently, India has to use "mutual legal assistance treaties" (MLAT) with the US to get the data of Indians that are controlled by American companies.
- By requiring a copy of the data to be stored in India (data mirroring), the government hopes to have more direct control over these companies, including the option to levy more taxes on them
- Recently lynching across the country were linked to WhatsApp rumours and in this context, localisation of data assumes significance.
- It gives security against foreign attacks and surveillance.
- Domestic companies support data localisation citing examples of China and Russia.
- Data is the new oil, data is strategic and foreign entities could cripple India in event of war or sanctions.
- India's data localisation push can give rise to new business opportunity.
- India is an ideal location for lower cost of operations and availability of quality talent.
- National wealth creation relies on in-house data storage.
- It champions domestic innovation.
- Massive amounts of data generated by cities can be used to improve infrastructure and transport systems as Singapore has done.

No, data localization is not needed due to:

- It will create domino effect of protectionist policy and other countries may also follow it. This leads to fragmentation of internet.
- It may affect India's young start-ups that are attempting global growth.
- It may affect big firms like TCS and Wipro because they are processing foreign data in India.
- Even if the data is stored in the country, encryption keys may remain out of reach of national agencies.
- It can act as "barriers" to expansion of services in India, impacting not only consumers but also growth of Indian payments market.
- Infrastructure in India for efficient data collection and management is lacking
- Others caution that these laws could bring increased state surveillance, like India's draft intermediary rules that would require WhatsApp to change its design to proactively filter messages.

Way forward:

- There is an urgent need to have an integrated, long-term strategy for policy creation for data localisation.
- Devising an optimal regulatory and legislative framework for data processors and data centres operating in the country.
- Adequate infrastructure in terms of energy, real estate, and internet connectivity also needs to be made available for India to become a global hub for data centres.
- Adequate attention needs to be given to the interests of India's Information Technology Enabled Services (ITeS) and Business Process Outsourcing (BPO) industries, which are thriving on cross border data flow
- Data needs to be shared with start-ups so that they can have a level playing field in offering innovative services with large and often global data companies.

Topic: Security challenges and their management in border areas - linkages of organized crime with terrorism.

Q) The geo-strategic importance of the Indian Ocean Region (IOR) has seen a gradual increase in the recent past. Under such conditions discuss the significance of Indian Navy's Presence and Surveillance Missions in the region and critical role played by them. (250 words)

The hindu

Why this question:

Question is about discussing the crucial role played by the Indian Navy in the Indian ocean region. Recently in an expansion of its Mission Based Deployments (MBD) in the Indian Ocean Region (IOR), the Navy deployed its P-8I long-range maritime surveillance aircraft for anti-piracy sorties from Salalah in Oman to patrol the Gulf of Aden.

Key demand of the question:

The answer must provide for a detailed narration of the geostrategic importance that the Indian ocean region holds for India and the countries around the region. One has to explain in detail the

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

write a few introductory lines the current efforts being made by the Indian Navy in the IOR.

Body:

Have the following points in the answer:

- The geo-strategic importance of the Indian Ocean Region (IOR) has seen a gradual increase in the recent past. Indian Navy regularly deploys ships for Presence and Surveillance Missions (PSM), off critical choke points / sea lanes in the IOR.
- Since August 2017, Indian Navy deployments in the IOR have been further structured under the Mission Based Deployment (MBD) concept.
- Under MBD concept, In addition to the anti-piracy deployment, IN ships were also Mission Deployed for :
 1. Operation 'GULFDEP' in the Persian Gulf,
 2. Operation 'CENTDEP' in the central Indian Ocean Region,
 3. Operation 'NORDEP' in the northern Bay of Bengal and
 4. Operation 'MALDEP' in the Andaman Sea and approaches to the Malacca Strait.

Discuss other Naval operations that were significant in the IOR.

Conclusion –

Conclude with significance.

Introduction:

- The Indian Navy recently deployed its P8I surveillance planes for carrying out anti-piracy patrol sorties from Salalah (in Oman) to patrol the Gulf of Aden and other piracy prone areas. The deployment is an expansion of Navy's Mission Based Deployments (MBD) in the Indian Ocean Region (IOR), to keep the region safe.

Body:

Geo-strategic importance of the Indian Ocean Region (IOR):

- Indian Ocean has gained tremendous importance over the years and has now become the most concerted area where global economic activity conjoined political interests.
- The combination of economic growth and slowdown, military expansion, increasing demand for natural resources, demographics combined with the geo-political situation, increased presence of nuclear capable actors and variances in regional structures of governance, highlights the geo-political significance of this area.
- It is a home to world's busiest waterways and chokepoints such as the Suez Canal, Bab al Mandeb, Strait of Hormuz and the Strait of Malacca. All these chokepoints and waterways are highly important for the rising nations of the world.
- More than half the world's armed conflicts are presently located in the Indian Ocean region.

- It is also home to
 - Continually evolving strategic developments including the competing rises of China and India
 - Potential nuclear confrontation between India and Pakistan
 - The US interventions in Iraq and Afghanistan
 - Islamist terrorism
 - Growing incidence of piracy in and around the Horn of Africa
- There has been a gradual to an accelerated expansion of maritime forces and their capabilities in the region.
- The growing presence of **extra regional powers and nuclear capable nations** has further altered the existing security framework. This is affecting the existing military balance and the impending imbalance could create a new architecture that could affect the prevailing security scenario.
- **Naval bases:**
 - US uses the island of Diego Garcia as a major air-naval base and logistics hub for its Indian Ocean operations.
 - France, meanwhile maintains significant presence in the north and southwest Indian Ocean quadrants, with naval bases in Djibouti, Reunion, and Abu Dhabi.
- **India:**
 - India imports about 70 percent of its oil through the Indian Ocean Region to its various ports. As a consequence, it has been enhancing its strategic influence through the use of soft power, by becoming a major foreign investor in regional mining, oil, gas, and infrastructure projects.
 - In addition, India has aggressively expanded its naval presence reportedly to include the establishment of listening posts in the Seychelles, Madagascar and Mauritius
- Its governance and security are under constant threat of being undermined, whether by non-state actors such as pirates, smugglers, and terrorists, or by furtive naval competition between states.

Mission-Based Deployments (MBD) philosophy was adopted by Navy in August 2017. This ensures availability of warships in 7-8 critical areas of the Indian Ocean Region on a nearly continuous basis to provide rapid response to any contingency. Under the MBD concept, the Navy now maintains a ship at every choke point in the IOR at any point of time.

The reasons behind the deployment of warships are:

- The continued prevalence of piracy
- Illegal fishing
- Arms smuggling and other such nefarious activities directly impinge on the maritime security of India in particular and the region at large.
- Natural disasters also ravage the region frequently.
- Increase in the presence of 'Extra-Regional Forces'.

Some of the missions:

- Operation 'GULFDEP' in the Persian Gulf,
- Operation 'CENTDEP' in the central Indian Ocean Region,
- Operation 'NORDEP' in the northern Bay of Bengal and
- Operation 'MALDEP' in the Andaman Sea and approaches to the Malacca Strait.

As part of expanding engagement maritime engagement, India has taken the following steps:

- India has stepped up its cooperation with Indian Ocean littoral states and maritime neighbours, as part of expanding its maritime engagement.
- Under the 'Neighbourhood First' policy, the Navy undertakes Joint Exclusive Economic Zone (EEZ) surveillance with Maldives, Seychelles and Mauritius and Coordinated Patrols (CORPAT) with Bangladesh, Myanmar, Thailand and Indonesia.
- Search and rescue and capability-enhancement activities have also emerged as major areas.
- Besides escorting Indian flagged vessels, ships of other countries have also been provided protection

Conclusion:

- Indian Ocean is an "**ocean of economic opportunities**". The growing interests of major powers (US, UK, Russia, France and Japan) in the region, and the many Chinese infrastructure projects in the region create an imperative for India to actively limit the military maritime activity of external powers in the region.
- India should use the multilateral route to create a consensus for peaceful and sustainable use of the Indian Ocean and its resources.

Q) Discuss the need for Defense reforms in India. In what way do you think the coming of Minister for security in the Cabinet going to prove to be a gamechanger ? (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article discusses about forging national security, what way Defense reforms should be a priority, the most vital being the creation of a Chief of Defense Staff.

Key demand of the question:

The answer must first discuss the current conditions of defense system in India, need for reforms and how the coming of minister of security is a positive step in the right direction.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In a few lines discuss the importance of national security.

Body:

The answer must discuss the following:

Explain the issues around India's national security and defense, the measures taken to address them ranging from setting up of Defense Planning Committee (DPC) to creation of national security strategy, international defense engagement strategy.

Then move on to discuss the concerns in dealing with security issues.

Bring out the positives of having created a dedicated minister for security, its significance.

Conclusion:

Conclude with way forward as to how the country is in need of defense reforms and this is a right step in the right direction.

Introduction:

- The state of India's national security and defence is getting worse than before and are in a dire need of reform. With the China-Pakistan Economic Corridor rapidly taking shape, the China-Pakistan embrace has got much tighter as has the convergence between China and Russia.
- China has intensified military engagements with several South Asian and Indian Ocean region states. Keeping in light all these there is a great necessity for India to reform its defence forces.

Body:

The need for defence reforms in India is due to the following challenges:

- **Military planning:**
 - It is hamstrung by lack of a clearly articulated and integrated military strategy. In such a situation, the three wings of the military are left to devise their own strategies and military philosophies, which could end up being at cross purposes with each other.
 - The reasons that can be ascribed to this state of affairs is the absence of military expertise at the apex level of national security and defence matters, exacerbated by **non-institution of the appointment of Chief of Defence Staff** to coordinate defence policy and strategy more meaningfully.
- **Centralisation:**
 - There are concerns that appointing NSA to SPG would lead to further centralisation of decision making.
 - The post of the NSA is also not a legally-mandated one and he has no parliamentary accountability.
- **Line of Control:**
 - Overall violence in Jammu and Kashmir and ceasefire violations on the Line of Control reached a 14-year high in 2017, and did not subside in 2018.
 - There are far more attacks on security forces and security installations in J&K, and militant recruitments and violence against civilians in the State are rising at an alarming rate.
- **Neighbourhood policy:**
 - Though the government claims that the surgical strikes of 2016 gave a befitting response to Pakistan, it hardly made any significant gains in reality.

- A report of the Parliamentary Standing Committee on External Affairs recently revealed that the Chinese forces are back in the Doklam plateau with more force.
- The report goes on to fault the government for continuing with its conventionally deferential foreign policy towards China.
- India's neighbourhood policy holds a clear absence of vision on how to balance, engage and work with the many great powers in the regional and the broader international scene.
- **Defence preparedness:**
 - India spends close to \$50 billion annually on defence and yet might still be ill-equipped to fight the wars of the modern age, especially in the neighbourhood.
 - India also suffers from almost non-functional higher defence organisation and the defence policy doesn't hold any political oversight or vision.
- **Defence management:**
 - There is little conversation between the armed forces and the political class, and even lesser conversation among the various arms of the forces.
 - Our doctrines, command structures, force deployments and defence acquisition continue as though each arm is going to fight a future war on its own.
- **Institutional lacuna:**
 - In India, talk of appointing a Chief of Defence Staff (CDS) has died down and the key post of military adviser in the National Security Council Secretariat (NSCS) remains vacant.
 - The NSC almost never meets and the National Security Advisory Board, initially set up to seek 'outside expertise' on strategic matters, has become a space for retired officials.
- **Modernisation:**
 - The state of modernisation and domestic defence industry in the country are in a sorry state.
 - Under the present system, where the ratio of revenue to capital expenditure in defence is roughly 65:35%, any serious attempt at modernisation would be impossible.

Minister of Security:

- The prime minister has added a sixth member to his Cabinet Committee on Security (CCS) known as "Minister for Security".
- The CCS currently comprises ministers of home, defence, finance, external affairs and Security, headed by Prime Minister.
- The new minister is granted a full-fledged cabinet minister rank.

Significance of Minister of Security:

- It reduces the burden of Minister of Defence to an extent.
- It increases the accountability
- The present NSA's credentials and expertise in the fields of internal security and intelligence as well as the affairs of our "near abroad" are well-known and his elevation could be the key to ensuring that focus is retained on national security.

Conclusion:

- There is clearly a need to view national security through a narrower prism and evolve a less ambitious doctrine that focuses on matters directly related to defence and security.
- It must provide strategic guidance to the military within clearly defined national aims and objectives.

GS-III

JULY **2019**

General Studies Paper - III

Topic: Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment. Inclusive growth and issues arising from it.

Q) What do you understand by inheritance tax ? Do you think the reintroduction of such a tax would serve as a measure to prevent the concentration of income and wealth in the hands of a few ? Discuss. (250 words)

Livemint

Why this question:

The article talks about how Wealth inequality in India has been alarming and in what way Inheritance tax and its reintroduction can prevent the concentration of income and wealth in the hands of a few.

Demand of the question:

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

Define what is an inheritance tax.

Body

Explain that an inheritance tax, coupled with associated tax reforms, can potentially prevent the concentration of income and wealth in the hands of a few, reduce intra-generational inequality, promote inter-generational equity, and serve a meaningful purpose to address the distributional gaps that exist in India today.

Explain that an inheritance tax, if implemented well, can potentially help the government exchequer at a time when it has been scouting for additional sources of revenue to bridge the persistent gap between fiscal targets and outcomes. Recent policies on farm loan waivers, bank recapitalization, universal health insurance, and the expansion of other social sector programmes will pose significant challenges in maintaining fiscal prudence.

List all the benefits and suggest what needs to be done.

Conclusion

Conclude with importance of such tax initiatives and reforms for the betterment of the economy.

Introduction:

- An inheritance tax, also called an estate tax, is a tax assessed on all or a portion of an inherited estate. Life insurance, pensions, real estate, cars, belongings and debts are all part of one's estate. The inheritance tax rate depends on the value of the inheritance and the beneficiary's relationship to the decedent.
- Such a tax can potentially prevent the concentration of income and wealth in the hands of a few. It is more than three decades since estate duty was abolished in India

Body:

The objective behind the reintroduction of an inheritance tax:

- Wealth, income, and consumption inequality is high and has been rising in India, particularly in the post-liberalisation period.
- Economists Lucas Chancel and Thomas Piketty, analysing the dynamics of income inequality between 1922 and 2014, found that income inequality in India is at its peak since 1922, when income tax was first introduced here. In the 1930s, the top 1% of earners in India accounted for less than 21% of total income. This dropped significantly to 6% in the 1980s. However, it thereafter steadily increased to a historical high of 22% in 2014.
- Wealth inequality in India has also been alarming. According to Credit Suisse 2018 Global Wealth Report, the richest 1% own 51.5% and the richest 10% account for 77.4% of the nation's wealth. In contrast, the bottom 60% of the population owns only a meagre 4.7% of it.
- While the per capita income of Indians has risen since liberalisation, growth has failed to be inclusive.
- An inheritance tax, coupled with associated tax reforms, can potentially prevent the concentration of income and wealth in the hands of a few, reduce intra-generational inequality, promote inter-generational equity, and serve a meaningful purpose to address the distributional gaps that exist in India today.

- An inheritance tax, if implemented well, can potentially help the government exchequer at a time when it has been scouting for additional sources of revenue to bridge the persistent gap between fiscal targets and outcomes.
- According to an Oxfam survey in 2018, the wealth of the richest 1% of the population increased by ₹20.91 trillion, equivalent to total budget of the central government in 2017-18.
- Moreover, 37% of Indian billionaires have inherited family wealth, and control 51% of the total wealth of billionaires in the country. The survey also points out that 51 of a total of 101 billionaires are more than 65 years old and collectively own ₹10.54 trillion.
- Thus, even a moderate inheritance tax of 10-15%, benchmarked to other Asian countries such as the Philippines, Taiwan and Thailand, can potentially act as a stable and significant source of revenue for the government.
- There has been a discernible improvement in the government's tax administrative capacity, drawing upon the strengths of the information technology revolution.
- Project Insight of the Central Board of Direct Taxes and the application of Big Data analytics to improve tax compliance have strengthened tax administration.
- This, along with the thrust towards a digital economy, could potentially reduce the marginal cost of administering and monitoring compliance of an inheritance tax.

Global Experience:

- Today, many developed countries such as the US, UK, France, Japan and the Netherlands have inheritance tax laws in place.
- The US imposes Gift Tax and Estate Tax (both taxes levied on the donor) at 40 percent with a combined lifetime exemption threshold for both taxes amounting to approximately \$11 million per person.
- Likewise, inheritance tax in the UK is levied at 40 percent, but with a far lower exemption threshold.
- The growing concern surrounding India's increasing economic disparity, the imposition of estate duty may seem desirable.

Concerns:

- The inheritance tax is payable by the legal representative to whom the property may pass on death.
- The recipient of the property may not have the money available to pay tax that could lead to situations of distress sale.
- Arguments against the levy of inheritance tax mainly revolve around fears regarding the outflow of entrepreneurial human capital and financial resources going abroad.
- With India being a developing country, keeping capital intact in the hands of entrepreneurs may represent a more efficient investment for economic development.
- India needs to review the case for re-introducing an inheritance/estate tax with, ideally, relatively high thresholds, so it's targeted at the very rich.

Conclusion:

- India's inheritance tax must not be used as a symbolic tool, marketed as a Robin Hood tax, for populism.
- Rather, the intent should be grounded in the substantial distributional inequities that exist in the country today.

Q) “Economic growth and human development need to go hand in hand, without it a \$5 trillion economy seems a distant dream”. Critically examine. (250 words)

Livemint

Why this question:

The author in the article discusses in detail how a \$5 trillion economy seems a distant dream unless the country revives aggregate demand and healthcare.

Key demand of the question:

Students are expected to elucidate on how economic growth is linked to human development and one can not be achieved without the other.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Discuss the dream of \$5 trillion economy in short.

Body:

One has to explain that the country still has not overcome the challenges related to human development such as health aspects, ageing population, employment, lack of investments in agriculture etc.

Then explain how the above problems have consequences on economic growth of the country.

Take cues from the article and explain in what way it is essential for the country to focus on human development to achieve greater goals of economic growth.

Conclusion:

Conclude by emphasizing need to work on human development front to ensure continuous economic growth and development.

Introduction:

- The President of India spoke of India becoming a “Five Trillion Dollar” economy, last month. It was reiterated by the Prime Minister and was even discussed in the NITI Aayog Governing Council meet.
- India is, currently, a \$2.8 trillion economy; to reach the \$5 trillion mark by 2024, the economy would require nominal growth in dollar terms of over 12% a year. To reach \$ 5 Trillion, we need to shift our perspective from policy to projects

Body:

Challenges towards realising the \$5 trillion economy goal:

- **Health aspects:**
 - Huge losses of output inherent in the incapacity of the aged increasingly vulnerable to non-communicable diseases (e.g. diabetes, cardiovascular diseases, cancer).
 - Only 54.9 % of infants aged between 0-5 months are exclusively breastfed which is very essential for a child’s optimal growth, development and health at least till 6 months of age.
 - Female mortality rate in India is 139 and 212 for male per thousand respectively.
 - India being a tropical country is always under a constant threat of climate related epidemics such as dengue, malaria etc. Incidence of malaria is 18.8 people per thousand at 2016 levels.
 - India remains to be the highest TB burden country according to WHO, with as many as 211 people per lakh suffering from either newly contacted or relapsed TB.
 - India spends 3.9% of its GDP on health expenditure
 - Relative to those who were not afflicted with NCDs, those who did display higher probabilities of being not employed and just employed, had much lower probabilities of part-time and full-time employment.
- **Education:**
 - The ASER report by Pratham shows poor arithmetic and reading skills among primary school children.
 - Gross Enrolment Ratio (GER) in pre-primary was 13% of pre-primary school age children showing acute under admission and lack of importance given to early years of schooling in India during 2012-17.
 - Primary school dropout rate in India during 2007-2016 was 9.8%.
 - Survival rate to the last grade of lower secondary general education during 2016-16 was 97%.
 - Total government expenditure on education is a paltry 3.8% of total GDP.
- **Social constraints:**
 - Brahmins and other “forward” castes showed notably lower probabilities of being not employed, or just employed, but higher probabilities of being employed part-time and full-time, compared to Other Backward Classes (OBCs).
 - Dalits and tribals displayed patterns similar to OBCs’.
 - India has a huge gender disparity leading to poor women labour force participation.
- **Ageing population:**
 - Indian population is estimated at 1339.2 million in 2017 and is estimated to reach 1513 million by 2030.
 - The aged (60 years and above), with their growing vulnerability to NCDs and disabilities (such as the inability to walk and dress, apart from speech and vision impairment), and caste and education barriers impeding their employment.
 - Old age acts as a barrier to part-time and full-time employment.

- This can impede the growth and even fail the benefits of demographic dividend.
- **Unemployment:**
 - Unemployment touched a 45-year high of 6.1% in 2017-18 according to the recently released first periodic labour force survey (PLFS) report.
 - This has resulted in slowing of gross domestic product growth.
 - Deepening crisis in agriculture, the paralysis of the informal sector, sputtering manufacturing growth and slowing exports are all causes for high unemployment rate in India.
- **Lack of investments in agriculture:**
 - There is neither renewed emphasis on investment-driven growth, nor higher outlays on agriculture, are likely to substantially boost employment

Measures needed:

Agricultural sector:

- Encouraging public and private investments to develop infrastructure like cold chains;
- Special attention for north-eastern, eastern and rain-fed states for augmenting scope of access to institutional credit;
- Rationalisation and targeting of input subsidies towards small and marginal farmers.

Manufacturing Sector:

- A three-pillar strategy to achieve required expansion of output — focus on existing high impact and emerging sectors as well as MSMEs.
- In the defence sector, there is a need to identify key components and systems and encourage global leaders to set up manufacturing base in India by offering limited period incentives.
- Ensure incentives result in technology/process transfer.
- Measures to boost manufacturing in other areas including aeronautical, space, garments, organic/ayurvedic products besides emerging areas such as biotechnology, electric mobility, unmanned aerial vehicles, medical devices, robotics and chemicals.
- For micro, small and medium enterprises, there is a need to improve access to funding by way of development of SME credit risk databases, SME credit rating, and creation of community-based funds

Services sector:

- There is a need for focus on champion services sectors like IT, tourism, medical value travel and legal would be required to achieve the expansion of the services sector output and concerted efforts need to be made to increase exports.
- Improving rail connectivity and seamless connectivity to major attractions.
- E-commerce policy and regulatory framework for logistics segment.
- To promote growth of accounting and financial services, there is a need to pitch for promoting FDI in domestic accounting and auditing sector, transparent regulatory framework, and easing restriction on client base in the accounting and auditing sector

Way forward:

- India needs to carry out the crucial internal reforms that will allow it to be a productive international player and to take on the leadership roles that so many people across the world hope that it will.
- Reorganization of the health system with much greater emphasis on primary medical centres or PMCs
- Any improvement in the life of the majority would require a re-alignment of the growth process so that it is less damaging.
- This would very likely require that we have slower growth but the process can be configured to channel more of it towards poorer groups.
- India could and should aspire to double-digit growth. Without sustained growth at that all levels it has little hope of employing the roughly one million young people who join its workforce every month.
- And unless it takes advantage of its current, favourable demographics it is never likely to emerge as an upper-middle-income economy with a prosperous and thriving middle class.

Q) Fifty years after bank nationalisation, banking is still seen as an enterprise driven by social purpose and political considerations and not depositors' interests. Discuss. (250 words)

[Indianexpress](https://www.indianexpress.com)

**Introduction:**

- July 19, 2019 marks 50 years of nationalisation of 14 commercial banks in India by the Indira Gandhi government. The measure of bank nationalisation came into effect under the Banking Companies (Acquisition and Transfer of Undertakings) Ordinance.
- The ownership of 14 major commercial private banks – estimated to be controlling 70 of the deposits in the country – was transferred to the government. According to many economists nationalization of banks was the single-most-important economic policy decision taken by any government after 1947. The impact of this decision is considered by some to be, even more than the economic reforms of 1991.

Body:**Rationale behind Nationalization of banks:**

- address the rising economic difficulties in the 1960s
- remove control of the few on banking system
- provide adequate credit for agriculture, small industry and exports
- professionalize bank management
- encourage a new class of entrepreneurs

Nationalization of Banks – as an enterprise driven by social purpose and political considerations:**Positives:**

- Control over some important parts of the so-called commanding heights of the economy has been eased by successive governments.
- Indian banking too has changed in terms of reach and penetration, formalisation of credit, channelizing savings for investment and for funding anti-poverty programmes, products offerings, service quality, efficiency, credit support to industry and other segments including in rural areas, helping to reduce regional disparities and boosting economic growth.
- In July 1969, at the time of nationalisation of banks, there were just 8,262 bank branches in the country. At the end of June 2018, state- owned banks alone had built a network of branches or a franchise of over 90,000 (over 29,000 in rural areas) and over 1.45 lakh ATMs while private banks had 28,805 branches.

Negatives:

- Some of the objectives of that political move in 1969 may have been achieved in the first decade or two.
- But what has remained unaltered in the last 50 years despite economic reforms is the political philosophy and belief.
- The political pay-offs are evident when the government retains control over the lenders. g.: The repeated instances of waiver of farm debt.
- Besides competition, rapid technological changes and innovation are transforming the way banks operate and when the government is struggling to cope with competing demands such as funding infrastructure projects, social sector programmes and delivering public goods. The result is Private banks have managed to chip away at the share of PSUs.
- The political philosophy reflected in the continuing ownership of many banks has come at a huge fiscal cost and poses a risk to financial stability. In the last five years alone, the recap tab at over Rs.3 lakh crore is far in excess of the aggregate funds, which many governments had infused over close to three decades, indicating the scale of the problem.
- Subsequent regimes have tried to pursue consolidation of banks. This is a politically less fraught affair compared to the option of privatisation but does not address the fundamental issue of governance, incentive structures for bankers, dual control and the separation of ownership or the distancing of the owner, the government from the management of the bank.

Nationalization not in depositor's interest:

- Most public sector banks (PSBs) are not in the desired position.
- The move failed to eradicate poverty and in scaling down inequalities of income, wealth and entitlements, especially in rural India.
- The performance of nationalised banks, on the parameters of branch expansion as well as increasing the number of deposits, never surpassed that of private banks.
- The real purpose was that it gave the ruling party access to finance as and when it needed without having to resort to black money.
- The government has pumped in over Rs 2.5 trillion in the last few years (including Rs 70,000 crore in 2019) and it still may not be enough.
- PSBs continue to struggle with a higher level of non-performing assets.

- **Recapitalisation:** The government does not have the fiscal space to continuously pump capital into PSBs. Click [here](#) to know more on recapitalisation.
- The idea of using recapitalisation bonds too has its limits as it is increasing the government's liability.
- **Technology:** The role of technology in banking and finance is rising rapidly.
- PSBs, with their weak balance sheets, are not in the best position to adapt and compete on this front.
- Naturally, the business will increasingly shift towards private sector banks.
- **Reforms:** It would be hard to implement the required reforms in PSBs in the present set-up.
- PSBs, which account for 66% of outstanding credit and 65.7% of deposits, need functional and operational independence.
- With the government being the majority shareholder, this will be difficult to attain.

Conclusion:

- Given the significance of a vibrant banking system in the growth story of the nation, privatisation of banks is proposed. However, privatisation of banks is not a panacea.
- India must not make haste in going for the privatisation of banks, rather it must focus on comprehensive governance reforms, resolution of NPAs and creating a free market so that investment can be reinvigorated and wheels of the economy can again get back on track.

Q) What are Private equity funds? Trace the growth of PE Funds in India. List down the advantages and disadvantages of the same. (250 words)

[Livemint](#)

Why this question:

The news of Café Coffee Day founder V.G. Siddhartha's disappearance has brought into focus the role of private equity (PE) investors in shaping the startup culture in India.

Key demand of the question:

The answer must evaluate the concept of private equity funds and trace the growth of PE funds and the advantages and disadvantages.

Structure of the answer:

Introduction:

Define what are PE funds.

Body:

Equity capital that is not quoted on a public exchange is Private Equity. Private equity funds are investment companies that, as a rule, do not hold publicly-traded securities but seek the equity stakes in private companies.

Then discuss the Growth of PE Funds in India.

PE investors have been enticed by India's growing status as an economic powerhouse, its strong entrepreneurial spirit.

Discuss their advantages and disadvantages.

Conclusion:

Conclude with way forward, suggest upon the importance of PE funds and need for their regulatory mechanism.

Introduction:

- A Private Equity Fund, also known as Private Equity, is **equity capital which comprises of investors who invest directly in private companies**. This equity capital is not listed on the stock exchange and usually follows general investment criteria of investing in varied industries or follows industry specific criteria.
- Considering that **holding periods for private equity funds are long**, therefore, **private equity capital is raised from institutional and retail investors who can afford to invest large sums of money for longer time periods**.

Body:

Growth of PE funds in India:

- In India, PE line of financing is still in its nascent stages.
- While in the early 2000s, the focus of PE investments was towards the **booming sector of Information Technology** due to its dynamic growth opportunities.
- However, after the **burst of the dot-com bubble**, PE investors shifted focus to other commercially viable industries.
- Another hindrance to the rising graph of the PE investment was the **economic meltdown in 2008- 2009** which substantially deflected the investment deals size.

- However, consequently Flipkart's USD 150 million, 4th round funding in 2012 Q1 kicked off an overall positive sentiment in funds investing in the domestic e-commerce industry.
- India witnessed an increase in the number and size of PE investments made in 2014 aggregating to around \$11.5 billion, which was 17% higher than the total investment value as compared to the same period the previous year.
- PE investors have been steadfastly interested in certain lucrative sectors including **E-commerce, financial services, power and, energy among others.**
- Most notably, in the current economic scenario, Indian real estate industry owes its foundation to private equity.
- PE financing, in a broad ambit – now makes up **75 percent of the funds in India's real estate sector**, compared with just about a fourth in 2010.

Advantages:

- **Untapped Potential:** The arena of potential company investments for private equity a vastly uncharted and untapped territory. There are several options looming in the horizon, from unlisted privately owned companies which have just begun expanding, unpopular divisions of larger organizations or even companies which aren't doing well on the stock market and make them private.
- **Stringent Company Selection Process:** Firms which handle private equity investments are highly selective and spend a considerable amount of resources to assess the potential companies which they could invest in. This also involves an understanding of the risks involved and how to ease the same. From scores of potential companies, managers can be highly selective and choose one company which possesses all the required characteristics.
- **Clear Accountability:** Management teams of private equity owned companies are accountable to an engaged professional shareholder who has the right to protect their shareholding and act accordingly.

Disadvantages:

- **Money laundering:** It is alleged that some PE capital is actually political money routed via tax havens such as Mauritius to convert it into white money.
- Some so-called equity PE deals are actually debt transactions involving the issue of fully convertible debentures or compulsorily convertible preference shares.
- The agreement may even carry a "put" option in favour of the PE investor or a "buyback" clause that makes it incumbent upon the promoter to buy the security at a specified price and time. Promoters who do not have the money are forced to borrow or sell other assets to arrange money for the buyback

Conclusion:

- The private equity segment has also played a crucial role in the growth and development of many small and medium-size enterprises. It has also stimulated employment opportunities in the country and aided the progress of strategic capabilities.

TOPIC: Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Q) What do you mean by liberalization? How does it affect the international business environment? What led to Liberalisation of Indian economy? Discuss. (250 words)

Indian Economy by Dutt and sundaram

Why this question:

The question is direct from GS paper III, it seeks to examine the effects of liberalization on international business environment and the causative factors responsible for liberalisation of Indian economy.

Key demand of the question:

The answer must discuss in detail what is liberalization, effects of it on international business environment, and the factors responsible for liberalisation of the Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what is liberalization.

**Body:**

Explain what you understand by liberalization?

What are the major goals of economic liberalization?

What is the importance of Liberalization?

Then discuss that the economic liberalization in India refers to the changes and reforms, initiated in 1991, of the country's economic policies, with the goal of making the economy more market- and service-oriented, and expanding the role of private and foreign investment.

Explain its effect on international business environment.

Conclusion:

Conclude with way forward and reassert the significance of it.

Introduction:

- Liberalization is defined as laws or rules being liberalized, or relaxed, by a government. Economic liberalization is generally described as the relaxing of government regulations in a country to allow for private sector companies to operate business transactions with fewer restrictions.
- It is usually promoted by advocates of free markets and free trade, whose ideology is also called economic liberalism. Economic liberalization also often involves reductions of taxes, social security, and unemployment benefits.

Body:

- With reference to developing countries, this term denotes to opening of their economic borders to multinationals and foreign investment.
- Many economists explained that economic liberalization is “opening up” to the rest of the world with regards to trade, regulations, taxation and other areas that generally affect business in the country.

Conditions that led to liberalization of Indian Economy:

- **Rise in Prices:**
 - Price rise continuously in India. The inflation rate increased from 6.7% to 16.7%. Due to inflation country's economic position became worse. Main reason for inflation was rapid increase in money supply. It was due to deficit financing Deficit financing means borrowing from Reserve Bank of India by Government to meet its deficit.
- **Rise in Fiscal Deficit:**
 - Due to increase in non- development expenditure fiscal deficit of the Govt. had been increasing. To cover the fiscal deficit, the Govt. has to raise loans and pay interest on it. Due to rise in fiscal deficit there was rise in public debt and interest. In 1991 interest liability became 36.4% of total govt. expenditure. The Govt. caught in debt trap. So Govt. has to resort to economic reforms.
- **Increase in Adverse Balance of Payments:**
 - When foreign exchange falls short for payment otherwise total imports exceed total exports, problem of adverse balance of payments arise. Though incentives are given for export promotion yet the desired results cannot be achieved. It is due to the fact that our export goods could not compete in price and quality. Liability of loan and its interest payment goes as increasing. It made balance of payments adverse.
- **Iraq War:**
 - In 1990-91, war in Iraq broke, and this led to rise in petrol prices. The flow of foreign currency from Gulf countries stopped and this further aggravated the problem.
- **Dismal Performance of Public Sector Undertakings:**
 - PSU's are enterprises wholly owned by Govt. have invested crores of Rs. in these enterprises. These are no performing well due to political interference and became big liability for Govt.
- **Fall in Foreign Exchange Reserves:**
 - Indians foreign exchange reserve fell to low ebb in 1990-91 and it was insufficient to pay for an import bill for 2 weeks. In 1986-87 foreign exchange reserves were Rs. 8151 crores ad in 1989-90, it declined to Rs. 6252 crores. Then Govt. had to sell Gold to meet the import liability.

Impact of Liberalization on international business environment:

- Investing in emerging market countries can sometimes be an impossible task if the country you're investing in has several barriers to entry.
- These barriers can include tax laws, foreign investment restrictions, legal issues and accounting regulations, all of which make it difficult or impossible to gain access to the country.

- The economic liberalization process begins by relaxing these barriers and relinquishing some control over the direction of the economy to the private sector. This often involves some form of deregulation and privatization of companies.
- Foreign companies got free access to Indian markets and made domestic products un-competitive. They obviously had better access to technology and larger economies of scale.
- The primary goals of economic liberalization are the free flow of capital between nations and the efficient allocation of resources and competitive advantages. This is usually done by reducing protectionist policies such as tariffs, trade laws and other trade barriers.
- One of the main effects of this increased flow of capital into the country is it makes it cheaper for companies to access capital from investors. A lower cost of capital allows companies to undertake profitable projects they may not have been able to with a higher cost of capital pre-liberalization, leading to higher growth rates.
- Software, BPO, KPO, LPO industry boom in India has helped India to absorb a big chunk of demographic dividend, which otherwise would have wasted. Best part is that export of services result in export of high value.
- In banking too India has been a gainer. Since reforms, there have been three rounds of License Grants for private banks. Private Banks such as ICICI, HDFC, Yes Bank and also foreign banks, raised standards of Indian Banking Industry. Now there is cut through competition in the banking industry, and public sector banks are more responsive to customers.
- Stock Markets are platforms on which Corporate Securities can be traded real time. It provides mechanisms for constant price discovery, options for investors to exit from or enter into investment any time. These are back bone of free markets these days and there is robust trade going all over the world on stock exchanges.
- Telecom sector was a government owned monopoly and consequently service was quite substandard. After reforms, private telecom sector reached pinnacle of success. And Indian telecom companies went global. However, corruption and rent seeking marred growth and outlook of this sector.

Conclusion:

- In the Indian case the term liberalisation is used to show the direction of the economic reforms-with decreasing influence of the state or the planned or the command economy and increasing influence of free market or the capitalistic economy.
- It is a move towards capitalism. India is attempting to strike its own balance of the 'state-market mix'. It means even if the economic reforms have the direction towards market economy it can never be branded a blind-run to capitalism.
- Since the economy was more like the state economy in the former years, it has to go for a greater degree of mix of the market.

Q) Do you think airlines in India can be run professionally under government control just as private airlines? Critically analyse. (250 words)

[Livemint](#)

Why this question:

The question seeks to examine the possibility of professional establishment of govt. airlines like that of the private ones amidst the recent debates surrounding the aviation industry.

Key demand of the question:

The answer must examine the possibility, associated issues and concerns.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with brief introduction of the aviation sector scenario in India.

Body:

Discussion should include the following:

First explain that in India in the early phase of commercial aviation, airlines were state-owned and profits were not the list of priorities behind the commercial operations. After the liberalization of air travel in the 1980s, there was intense competition. Low-cost carriers, introduced cut-throat rivalry,

and government airlines started struggling. However, privatization is not a panacea for current problems of airlines. Some airlines despite being owned by the government are doing well.

List the issues plaguing the aviation sector, specifically the government ones and conclude what can be done.

Conclusion:

Conclude with way forward.

Introduction:

- The suspension of operations at Jet Airways — at one time India's largest private airline — announced recently, follows the troubles at Kingfisher, Air Deccan, and Sahara. The aviation sector is rife with hope and distress in a highly competitive market over the last 30 years.
- Despite the fact that the Indian civil aviation industry is currently considered the third largest domestic civil aviation market in the world, the industry is suffering from several problems India's government is pushing towards the privatisation of its debt-laden carrier Air India, which is losing market share amid cut-throat domestic competition.

Body:

Yes, Government can professionally run airlines in India:

- There is no empirical evidence that private sector can run a better airline. After being privatised British rail has gained a reputation for poor services and management.
- There are many sectors and routes which the private airlines may not be interested in flying as they may not find them economical to operate.
- Connectivity to northeast and other sectors which were not explored by private airlines were undertaken by air India but now this might be an issue.
- In some situations, it is necessary to carry out emergency evacuations of Indian nationals from other countries due to natural hazards, political instability or wars.
- The civil aviation market in India, like in many parts of the world, is oligopolistic, with a few firms controlling large market shares.
- Forcing the exit or merger of an established state-run airline with the third largest market share by which has 31% of the planes in the sector and prime slots at airports worldwide will only aid in the undesirable concentration of market power with a few already large private airlines, and will prove anti-competitive.

No, privatization is better for airlines:

- Indian state need not run commercial enterprises for the simple reason that it tends to compromise profit for achieving overall welfare of the people
- In the case of Air India, the airline needs better management so as to not be a burden on the country's finances.
- The government will have to keep bailing out Air India with taxpayers' money if it decides to hold on to it.
- In the case of Air India, the cost is a lot higher as it is consistently making losses and is dependent on the government for survival. Further, the presence of state-owned enterprise distorts the market.
- A firm with access to government finances and practically no fear of failing affects price discovery in the market and can hurt private sector operators in the business.
- The government has fiscal constraints and needs to spend more in important areas such as health and education.
- The privatisation of airlines will ensure that the industry will run in a rational way. The private player, will bring about a rational spending, funding and capital infusion in Air India.
- According to **Economic survey**, disinvestment in public sector airlines will help boost Indian airlines' international market share.
- Problems faced by public sector airlines could be diluted:
 - For instance, since 2011-12, despite infusing Rs 24,000 crore of taxpayer money as equity support into Air India, the domestic share of the carrier has fallen from 19% to 13%.
 - The accumulated debts of the carrier have increased to around Rs 50,000 crore.
 - The national carrier is one among other airlines that were struggling and is still undergoing a 10-year rehabilitation package that started in 2012.
- Brings in more professionalism and reduces political interference.
- Competition might lead to lower fares.
- Helps it to achieve targets under UDAN scheme.

**Way forward:**

- **Offer a single integrated network:**
 - The domestic and international operations should be offered in one line, as there is significant value in the feed which they provide to each other. Air India is also part of a global system as a result of its membership of Star Alliance. Separation of domestic and international operations will result in reduced interest.
- **Provide comprehensive disclosures:**
 - The data room should include detailed information on Air India's finances and labour contracts as these are two of the most sensitive issues that will impact interest and valuations. A large proportion of the technical staff is due to retire within the next 5-10 years which is an issue that the new owners will need to prepare for.
- India should encourage development of domestic hubs so that Indian airlines can take passengers directly, instead of foreign carriers first taking passengers to their home countries and then offering them onward connections.
- To make private airlines operate in uneconomical routes, special incentives or subsidies can be granted to airlines operating on such routes.
- The government can establish a specialised agency under the Defence or External Affairs Ministry for evacuating Indians from foreign countries.
- On easing current restrictions on Indian airlines to fly overseas, the Survey has advocated a further liberalisation of the 0/20 rule.
- Public sector airlines will have to cut layers of management, align staff by role, bring in lateral hires, overhaul customer facing functions, and implement a massive training exercise.

Q) Examine the impact of liberalisation on Indian companies, to what extent are they competing successfully with the MNCs? Discuss. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

Key demand of the question:

The question is about analysing the impact of liberalisation specifically on the Indian companies and in what way they are competing the MNCs satisfactorily.

Directive:

Examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Begin with brief introduction on what you understand by liberalization.

Body:

Discussion should include the following:

First explain the effects of liberalization in general and then explain how it impacted the Indian companies and in what way is the impact different from that on the MNCs

Explain that Foreign direct investment (FDI) in India is a major monetary source for economic development in India. Foreign companies invest directly in fast growing private Indian businesses to take benefits of cheaper wages and changing business environment of India.

Then discuss in what way it is helping the Indian companies to compete with other MNC's successfully, what are the challenges associated etc.

Conclusion:

Conclude with way forward.

Introduction:

- Liberalization is defined as laws or rules being liberalized, or relaxed, by a government. Economic liberalization is generally described as the relaxing of government regulations in a country to allow for private sector companies to operate business transactions with fewer restrictions.
- It is usually promoted by advocates of free markets and free trade, whose ideology is also called economic liberalism. Economic liberalization also often involves reductions of taxes, social security, and unemployment benefits.

**Body:****Impact of Liberalization on Indian companies:****1. Impact on Small Scale companies:**

- After independence, government attempted to revive small scale sector by reserving items exclusively for it to manufacture. With liberalization list of reserved items was substantially curtailed and many new sectors were thrown open to big players.
- Small scale industry however exists and still remains backbone of Indian Economy. It contributes to major portion of exports and private sector employment. Results are mixed, many erstwhile Small scale industries got bigger and better. But overall value addition, product innovation and technology adoption remains dismal and they exist only on back of government support.

2. Impact on Services Sector

- In this case globalization has been boon for developing countries and bane for developed ones. Due to historic economic disparity between two groups, human resources have been much cheaper in developing economies.
- This was further facilitated by IT revolution and this all culminated in exodus of numerous jobs from developed countries to developing countries. Here US have to jealously guard its jobs as we guard our agriculture.

3. Information Technology industry

- Software, BPO, KPO, LPO industry boom in India has helped India to absorb a big chunk of demographic dividend, which otherwise would have wasted. Best part is that export of services result in export of high value. There is almost no material exported which consume some natural resource. Only thing exported is labor of Professionals, which doesn't deplete, instead grows with time. Now India is better placed to become a truly Knowledge Economy.
- Exports of these services constitute big part of India's foreign Exchange earnings. In fact, the only three years India had Current Account surplus, i.e. 2000-2002, was on back of this export only.

4. Telecom Sector

- Conventionally, Telecom sector was a government owned monopoly and consequently service was quite substandard. After reforms, private telecom sector reached pinnacle of success. And Indian telecom companies went global. However, corruption and rent seeking marred growth and outlook of this sector.
- Entry of modern Direct to Home services saw improvements in quality of Television services on one hand and loss of livelihood for numerous local cable operators.

5. Education and Health Sector

- It should be noted that food (Agriculture), Health and education (and to lesser extent banking) are among basic necessities, which every human being deserves and can't do without. Unfortunately, in developing countries there is market failure in all these sectors and majority of people can't afford beyond a certain limit (or can't afford at all). Concept of free markets, globalization, liberalization etc. fails here miserably. Free markets provide goods and services to people who can afford paying for them, not to those who deserve and need these.
- Now if we consider these sectors from angle of our inclination towards free markets, certainly there has been lot of progress. There has been world class education available in India and Deregulation has resulted in Mushrooming of private engineering and Medical Colleges. But in reality, this had far reaching devastating effect on society.
- On Social front India's performance is deplored all over the world and it is probably behind all important developing economies. This lacuna has been recognized and government has taken the charge. In case of education almost universal enrolments has been achieved upto primary level and now impetus should be on improving quality, so that student of public schools comes at par with at least average private ones.

Conclusion:

- In the Indian case the term liberalisation is used to show the direction of the economic reforms-with decreasing influence of the state or the planned or the command economy and increasing influence of free market or the capitalistic economy.
- It is a move towards capitalism. India is attempting to strike its own balance of the 'state-market mix'. It means even if the economic reforms have the direction towards market economy it can never be branded a blind-run to capitalism.
- Since the economy was more like the state economy in the former years, it has to go for a greater degree of mix of the market.

Q) Trace the evolution of FDI in defence sector of India and also analyse the Implications of FDI in Defence on Self-Reliance and Indigenisation. (250 words)

[Financialexpress](#)

Why this question:

The question is based on the policy perspective with respect to the investments in the defense sector and in what way FDI brings in self-reliance and Indigenization.

Key demand of the question:

The answer must discuss the importance of FDI in defense, trace its evolution and analyse in detail its implications.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Discuss first the importance of investments in defense sector in general.

Body:

The body of the answer to have the following aspects covered in detail :

Explain the evolution of FDI in Defence Sector.

Then discuss the associated advantages (Transparency, Quality Products, Reduction of Reserves, Positive Performance Pressure on Public Sector Enterprises, Employment Opportunities etc.) and disadvantages (Security Concerns, Competition for Domestic Private Industry, Overbearing Presence of Foreign Companies etc.)

Then focus on to explaining the Implications of FDI in Defense on Self-Reliance and Indigenization.

Conclusion:

Conclude with way forward.

Introduction:

- India's defence industry received foreign direct investment (FDI) of a meagre USD 2.18 million during 2018-19. In 2014-15, 2015-16, and 2017-18, the sector attracted FDI worth USD 0.08 million, USD 0.10 million and USD 0.01 million, respectively, according to data given by Commerce and Industry Minister in a written reply in the Lok Sabha.

Body:

- Importance of FDI in defence sector lies in **Quality Products, Boost to Economy, Employment Opportunities, Increase in International Trade, Positive Performance Pressure on Public Sector Enterprises, Transparency and reduced corruption and Reduction of Reserves.**

Evolution of FDI in defence sector of India:

- The Defence Sector in India, being a strategic sector, was **traditionally reserved for the Public Sector till 1991.**
- Defence Public Sector Undertakings (Defence PSUs) and Ordnance Factory Board (OFB) monopolised defence products manufacturing while R&D was the exclusive turf of DRDO.
- The **concept of FDI in general was introduced in India in 1991** with the opening of the Indian economy.
- However, the Defence Sector was opened up 100% in **May 2001 for Indian Private Sector participation with FDI permissible up to 26%**, both subject to licensing.
- In August 2014, the Department of Industrial Policy and Promotion (DIPP) raised the limit up to 49% through Government route and above 49% through Cabinet Committee on Security (CCS), on case-to-case basis.
- The Government formulated a revised "Consolidated FDI Policy" in 2016, where the policy permitted FDI cap in defence, through **automatic route up to 49% and above 49% under Government route on case to case basis**, wherever it is likely to result in access to modern and "state-of-the-art" technology in the country.
- The **Government further raised FDI cap to 100% on again in 2016.** The phrase state-of-the-art was dropped for FDI above 49%. The **CCS approval was no more required.**
- However, the process of approval itself will include the Ministry of Defence (MoD) and the Ministry of Home Affairs (MHA) which will consider issues related to defence of the nation, internal security and every other matter which relates to the national security.
- The **requirement of single largest Indian ownership of 51% of equity has also been removed. A lock-in period of three years on equity transfer has been done away with in FDI for defence.**

Implications of FDI in Defence on Self-Reliance and Indigenisation:

- **Build industrial capability and ecosystem:** Utilise FDI as a route to attract much needed foreign capital to boost building of the indigenous defence industrial manufacturing capability.
- **Induction of modern technology:** Enhanced FDI, that enables majority stake holding by foreign company, represents not merely acquisition of funds but also realistic possibilities of access to coveted modern technologies for weapons and equipment. The weapons and equipment so manufactured, on becoming globally competitive, in turn, would attract more FDI and better technology and the progressive cycle goes on.
- **Reduction in imports:** FDI in defence is likely to substantially improve the country's capacity to manufacture defence weapons and equipment locally and meet both qualitative and quantitative requirements of the Armed Forces.
- **Greater reliability of supplies in war.**
- **Better spares support**
- **Insulation from Embargoes:** Currently, India procures most of the critical weapons systems and equipment that are either manufactured or both manufactured and integrated abroad. When the same weapons systems and equipment are manufactured in the country, indigenous production will tend to insulate the country from unilateral imposition of embargoes by whimsical foreign suppliers.

Way Forward:

- **National Defence Industrial Policy:** There is a genuine requirement to articulate National Defence Industrial Policy which should deal with all relevant issues pertaining to defence design, development and production.
- **Enhance FDI Cap:** It is strongly recommended to permit enhanced FDI, above 49 percent through Government route, in deserving cases without being overly protective about the Defence Public Sector Enterprises. Further liberalised FDI Policy in the Defence Sector is the need of the hour.
- **Minimise Procedural Delays:** Government should ensure that there is transparency, evident decisiveness and no room for bureaucratic/procedural delays and corruption.
- **Enhance interaction between Armed Forces and Industry:** The Armed Forces need to actively interact with the industry to enable focus on the technology desired in the future weapons systems and equipment.
- **Promote Export of Defence Products:** Exports should be encouraged to ensure economic viability of an enterprise as also to earn foreign exchange to offset the initial foreign exchange outflow.
- **Explore Strategic Partnership Model:** The partnership would essentially provide for long-terms needs of the Armed Forces. This route encourages the Industry to invest in Research and Development.
- **Build Military-Industrial Complex:** Suitable incentives, in terms of provision of funds for research, tax relief based on the investment made in research projects, provision of land on concessional rates to defence vendors, are required to be extended to encourage investment by Private Industry in R&D.
- **Extend Assistance to Domestic Private Sector:** India's Private Sector needs hand holding, in terms of technology to be able to graduate to manufacturing of complex modern weapons systems and military equipment by collaboration with foreign technology majors.
- **Encourage Multi-Nation Consortiums:** India should exploit its favourable geopolitical location and aspire to be a regional hub for global outsourcing of weapons and equipment. BrahMos Cruise Missile is an excellent example of high-grade output of consortium approach.

Conclusion:

- But at the same time we should realize that FDI is not a magic wand which can solve all the problems of the defence sector.
- So Increase in the FDI Cap should be complemented by other defence sector reforms such as ensuring enabling environment for investment, solving land acquisition issues etc.

Q) Do you think Insolvency and Bankruptcy Code can emerge as the lynchpin for resolving stressed assets in a time-bound manner? Critically analyse. (250 words)

[Livemint](#)

Why this question:

The Central government introduced the Insolvency and Bankruptcy Code (IBC) in 2016 to resolve claims involving insolvent companies. This was intended to tackle the bad loan problems that were affecting the banking system. Two years on the IBC has succeeded in a large measure in preventing corporates from defaulting on their loans. The IBC process has changed the debtor-creditor relationship.

Demand of the question:

The answer must analyse in detail the merits and demerits of Insolvency and Bankruptcy Code (IBC).

Directive word:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Define the basic features of Insolvency and Bankruptcy Code (IBC).

Body

Explain that Insolvency and Bankruptcy Code, 2016 is considered as one of the biggest insolvency reforms in the economic history of India.

This was enacted for reorganization and insolvency resolution of corporate persons, partnership firms and individuals in a time bound manner for maximization of the value of assets of such persons.

Then discuss the objectives of the IBC, explain the key aspects, the successes, challenges in implementation etc.

Conclusion

Conclude with way forward.

Introduction:

- The Government of India implemented the Insolvency and Bankruptcy Code (IBC) to **consolidate all laws related to insolvency and bankruptcy and to tackle Non-Performing Assets (NPA)**, a problem that has been pulling the Indian economy down for years.
- The Union cabinet’s approval of amendments to the Insolvency and Bankruptcy Code (IBC) to enhance its efficacy could bring relief to banks, foreign investors and others worried about the impact that quasi-judicial interpretations of the code’s grey areas might have on the country’s credit systems.

Body:

Yes, IBC is the lynchpin:

- **Unified law:** The interest of all parties i.e. lenders, borrowers and even operational creditors is now addressed under a unified law under the IBC.
- **Changed behavior of defaulters:** The IBC has given more teeth to lenders and has changed the credit behavior of borrowers. Now, there is a heartening trend of defaulters paying up dues before the case is admitted for insolvency under IBC.
- **Shift of control from debtor to creditor:** IBC proposes a paradigm shift from the existing ‘Debtor in possession’ to a ‘Creditor In Control’ regime, as now the Board of Directors is suspended in case of default and the IP manages the enterprise in the best interest of all its stakeholders.
- **Resolving the ‘chakravayuh challenge’:** IBC has made possible for struggling companies to ‘exit’ easily by allowing creditors to take the company to the NCLT for winding up.
- **Spurs professionalism in financing sector:** IBC has reduced crony capitalism, under and over invoicing, serial defaulters and lead to better allocation of capital by limiting the escape routes for defaulters and water tight frame for disposal of cases

Success of IBC so far:

- Due to the institution of IBC, we have seen that many business entities are paying up front before being declared insolvent. The success of the act lies in the fact that many cases have been resolved even before it was referred to NCLT.
- 4452 cases were dismissed at the pre-admission stage. Hence, it shows the effectiveness of IBC.
- Presently, there are 1332 cases before NCLT.
- Realization by creditors around Rs 80,000cr in resolution cases.
- Banks recovered Rs 5.28 lakh crore in 2017-18, compared to just Rs 38500 cr in 2016-17.
- The maximum amount recovered was Rs 4, 92,500 cr from 21 companies.
- 12 big cases are likely to be resolved this year, and the realization in these cases is expected to be around Rs 70000 Cr.

Challenges posing the IBC:

- **Tribunal issues:**
 - The NCLT started off well but they are clogging up now, they’re taking much longer than they did earlier.
 - More than 9,000 cases are before the 11 NCLT tribunals that have been set up around the country.

- National Company Law Appellate Tribunal (NCLAT) and that includes more than 2,500 insolvency cases.
- In the absence of jurisprudence and precedents, different NCLTs are giving different rulings.
- **Concerns with time stipulation:**
 - Regarding the time stipulation, in few cases the tribunal laid down that the 14-day period is only directive and not mandatory.
 - Also, the NCLAT has held that the provisions of the Limitation Act, which sets out the time-limits under which a complainant can approach the courts for redress, do not apply to proceedings under the Insolvency Code.
- **Administrative issues:**
 - IBC has failed to secure the due share of banks as the amount realized by banks in cases is falling too low, in some cases amount realized is less than even one-third of bank's claim value.
 - There have been loopholes in the functioning of Committee of Creditors. Nominated members of Financial creditors does not have any authority to take decisions upfront. It leads to a conflict of interest in reaching a revival plan.
 - There is no proper infrastructure of the Information Utilities (IU) that provide access to credible and transparent evidence of default.
 - There is a multiplicity of regulators to Insolvency Professionals i.e. presence of numbers of insolvency professional agencies (IPAs) to regulate professionals.
- **Authoritative Insolvency Resolution Professionals:**
 - The IBC's provision to throw the management out and replacing them with IRPs is consider to be draconian.
 - IRPs are a mix of chartered accountants, cost accountants, MBAs and retired public sector executives but there are many concerns has raised over the quality of the IRPs.
- **Drafting loopholes:**
 - Inevitably, there are loopholes in the Insolvency Act and some lawyers complain of poor drafting too.
 - For instance, the act has no provision for an amicable settlement once a case has been admitted.

Way forward:

- There is need for setting up more tribunals in different parts of the country to handle the greater-than-expected volume of cases.
- IBC must consider that there are distinct advantages if the existing management is allowed to keep running the company such as knowledge, information and expertise.
- India is more concerned with the recovery of NPA, not with the running of units, thus the first priority is to save the banking system.
- Thus the banks also must push policy makers towards this move because they're unlikely to get more if the case comes before the NCLT.
- Proactive training/onboarding of judges, lawyers, and other intermediaries will be necessary for effective implementation of the code.
- Technological infrastructure needs to be strengthened to avoid any kind of data loss and to maintain confidentiality. There is a requirement of enhanced IU infrastructure.

Conclusion:

- IBC as a structural reform has demonstrable impact, which is reflected in behavioural change among debtors, creditors and other stakeholders, it is the IBC or the insolvency law which has trumped even the GST.

Topic– Inclusive growth and issues arising from it.

Q) Discuss the impact of global warming on future economy and Jobs, explain more so specifically with respect to Indian scenario. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article discusses the report, 'Working on a warmer planet: The impact of heat stress on labour productivity and decent work' anticipates an increase in "heat stress" resulting from global warming. It projects global productivity losses equivalent to 80 million full-time jobs in 2030, and the projection of 34 million jobs would make India the worst affected.

Demand of the question:

The answer must discuss the impact of global warming on future economy and Jobs.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments

Structure of the answer:

Introduction

Briefly discuss the recent trends in global warming, highlight the recent trends in it.

Body

The answer should discuss the following –

The report defines heat stress as heat in excess of what the body can tolerate without suffering physiological impairment. It generally occurs at temperatures above 35°C, in high humidity. Excess heat during work is an occupational health risk and restricts workers' physical functions and capabilities, work capacity and thus, productivity.

Take hints from the article and the report state how global warming can directly impact the job scenario and the economy.

Conclusion

Conclude by suggesting measures to tackle such adversaries.

Introduction:

- Climate change is certainly without argument the most serious global environmental crisis that we face. It is not the only environmental problem, but it is unique in its multi-scalar characteristic, from the global to the local. And, in many ways, it is arguably the most immediate of our problems.

Body:

India is more vulnerable to climate change:

- India, being a tropical country, is more susceptible to changes in temperature.
- Also, in India, about 50% of the population directly or indirectly depends on agriculture for a livelihood.
- The existent distress in the farm sector and the state governments' response with loan waivers has already strained their fiscal condition.
- Furthermore, the production of kharif crops is expected to decline.
- The possibility of adverse weather events is likely to increase in the future posing a greater challenge.
- The impact of climate change in agriculture is thus expected to reverberate in other sectors of the economy and affect the overall growth prospects.

Impact of global warming on India's future economy and Jobs:

- By 2030, India is expected to lose an equivalent of 34 million jobs as a result of global warming, says a report released by the ILO.
- The report, 'Working on a warmer planet: The impact of heat stress on labour productivity and decent work' anticipates an increase in "heat stress" resulting from global warming.
- It projects global productivity losses equivalent to 80 million full-time jobs in 2030, and the projection of 34 million jobs would make India the worst affected.
- The region projected to lose the most working hours is southern Asia, at 5% in 2030, corresponding to around 43 million jobs, respectively.
- A third of the southern Asian countries have already incurred losses greater than 4%.
- India, which lost 4.3% of working hours in 1995 because of heat stress, is projected to lose 5.8% of its working hours in 2030, which corresponds to 34 million jobs.
- The impact of heat stress on labour productivity and decent work' anticipates an increase in "heat stress" resulting from global warming.
- With some 940 million people active in agriculture around the world, farmers are set to be worst hit by rising temperatures, according to the ILO data, which indicates that the sector will be responsible for 60 per cent of global working hours lost from heat stress, by 2030.
- The report projects losses in working hours as **04% in agriculture, 5.29% in manufacturing, 9.04% in construction, and 1.48% in services.**
- Although most of the impact in India will be felt in the agricultural sector, more and more working hours are expected to be lost in the construction sector, where heat stress affects both male and female workers," the report says.
- There is little data in the country to corroborate trends of climate change and employment.

- However, that there has been no direct job loss at present, with distressed workers switching from one vulnerable sector to another.

Way forward:

- There is a need to strengthen its macroeconomic stability to deal with temperature shocks.
- India has considerably reduced its dependence on the monsoon as evident from avoiding a runaway inflation even after two successive years of drought.
- However, more needs to be done to enhance productivity in the agriculture sector.
- India can work on programmes that will help improve the quality of land and reduce the risk of climate change. Ex: Use employment under the MGNREGA to enhance soil and water conservation.
- India also needs to strengthen its overall capability by investing in and adopting new technology.
- We need to move climate change, global warming to the top of our foreign policy agenda.
- We need to start taking climate change more seriously, particularly on the adaptation side, because we really have a lot to be concerned about.
- And on the mitigation side, we have to be careful as we may not be fully exploring the scope of intersections between 'a low carbon agenda' and 'a development agenda'.

Q) “Despite India’s outstanding growth in the last two decades, low pay and wage inequality remain serious obstacles towards achieving inclusive growth. An effective minimum wage policy that targets the vulnerable bottom rung of wage earners can help in driving up aggregate demand, and building and strengthening the middle class, and thus spur a phase of sustainable and inclusive growth”. Comment. (250 words)

Livemint

Why this question:

The article highlights how in recent years, minimum wage systems have been strengthened by many countries to lift workers out of poverty and to reduce levels of inequality.

Key demand of the question:

The answer must bring out the relevance of minimum wage policy to Indian scenario and in what way it can be a game changer in alleviating people out of poverty and spurring sustainable and inclusive growth.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief explain what you understand by minimum wage policy.

Body:

Start by discussing the on going debate of the concept of minimum wage policy in economic survey. The Survey advises that the proposed labour code should include a provision for a minimum wage for both informal and formal sector workers, as 93% of the labour force is engaged in unorganized work. Discuss how and why India needs to have a mandatory national-level minimum wage to promote social justice and curb distress migration.

Discuss both the positives and negatives of such a policy.

Conclusion:

Conclude with a fair and balanced approach.

Introduction:

- The **International Labour Organization (ILO)** defines minimum wages as the **minimum amount of remuneration that an employer is required to pay wage earners for the work performed during a given period, which cannot be reduced by collective agreement or an individual contract.**
- A well-designed and streamlined minimum wage system is required to reduce wage inequality in India, the Economic Survey 2019 says.

**Body:****Need for a minimum wage policy in India:**

- Currently, the minimum wage system, under the Minimum Wages Act, 1948, in India is complex, with 1,915 different minimum wages defined for different job categories across States.
- Despite the complex system, workers were still falling through the gaps.
- About 93% of the labour force is engaged in unorganized sector.
- Salaries have undergone big increases in India and corporate emoluments have are increasing rapidly too.
- But wages (in real terms) remains where it was before the beginning of the 'New Economic Policy' of 1991.
- Wages of the unskilled workers vary wildly from Rs 850 per day in Kerala to a third of it in most other parts of the country.
- According to the ILO, One in every three wage workers in India is not protected by the minimum wage law.
- There are huge disparities within the various jobs in unskilled category. For instance, the minimum wage rate for domestic workers within a State is consistently lower than that for the minimum wage rates for security guards.

Pros of National Minimum wage policy:

- Workers who can cover the cost of living have better morale. They are more productive if they have a decent standard of living.
- A mandatory minimum national wage will force states to pay more than the floor rate, but not less
- It helps target the vulnerable bottom rung of wage earners can help in driving up aggregate demand and building and strengthening the middle class
- The move, the Survey said, will improve help regions attract investment and reduce distress migration.
- This would bring some uniformity in minimum wages across the country and make all states almost equally attractive from the point of view of labour cost for investment
- minimum wages can promote social justice without any major negative implication for employment if wages are set at an adequate level
- A minimum wage spurs economic growth. It gives workers more money to spend. This increases demand and business revenue.
- Workers who have more time and money can then invest in their education. This further increases their productivity. It improves the attractiveness of the country's labour pool. A more educated workforce increases innovation and the number of small businesses.

Cons:

- The minimum wage laws raise business labour costs. That's already the largest budget item for most of them. When the government forces them to pay more per worker, they hire fewer workers to keep the total labour costs the same. This increases the unemployment rate.
- It hits low-wage workers the hardest since they must now compete for fewer jobs. Some smaller companies may not be able to operate with fewer workers. They may be forced to declare bankruptcy instead.
- According to the Confederation of Indian Industries (CII), states should have the power to determine minimum wages as the concept of a national minimum wage will affect job creation.
- A minimum wage penalizes companies that are labour-intensive. By default, this rewards those that are in capital-intensive industries. Over time, this can shift the very fabric of the country's economic base.
- Minimum wage laws may increase job outsourcing. Companies move their facilities to countries where labour costs are lower.
- Minimum wage laws may not reduce the country's poverty. It helps the workers who have jobs but increases unemployment. Research shows experienced workers received higher pay for less experienced workers lost their jobs.
- It could raise the cost of living in some areas. A higher minimum wage allows workers to pay more for housing. As a result, landlords could raise rents, creating inflation.

Measures needed:

- Increasing the ambit of the minimum wage system, it recommended deciding minimum wages on the basis of skills and split across geographical regions.
- With the government in the process of bringing the Code on Wages Bill in Parliament, the survey said the rationalisation of minimum wages proposed by the Bill should be supported.
- The code will bring together the Minimum Wages Act, 1948, the Payment of Wages Act, 1936, the Payment of Bonus Act, 1965 and the Equal Remuneration Act, 1976 into a single legislation.

- The survey suggested the government should notify a **“national floor minimum wage”** across five regions, after which States can fix their own minimum wages, but not lower than the floor wage.
- This would bring uniformity and make States “almost equally attractive from the point of view of labour cost for investment as well as reduce distress migration.”
- The proposed Code on Wages Bill should extend applicability of minimum wages to all employments/workers in all sectors and should cover both the organized as well as the unorganized sector.
- A mechanism for regular adjustment of minimum wages should be developed, with a national-level dashboard at the Centre that States can access and update.
- An easy to recall toll-free number to lodge complaints about non-payment of minimum wages should be publicised.

Conclusion:

- A simple, coherent and enforceable Minimum Wage System should be designed with the aid of technology as minimum wages push wages up and reduce wage inequality without significantly affecting employment.
- An effective minimum wage policy is a potential tool not only for the protection of low paid workers but is also an inclusive mechanism for more resilient and sustainable economic development

Q) What are social stock exchanges? Discuss its need and potential in India. (250 words)

[Indianexpress](https://www.indianexpress.com)

Introduction:

- A social stock exchange (SSE) is a platform on which social enterprises, volunteer groups and welfare organisations will be listed so that they can raise capital.
- It will bring together social enterprises and impact investors on a common platform. Finance Minister announced that the government plans to create a social stock exchange (SSE) in the budget 2019. The SSE in India will be under the ambit of SEBI.

Body:

Need:

- Social enterprises are playing a very significant role in solving real problems in education, healthcare and financial inclusion.
- The Electronic Fundraising Platform acknowledges the problem of investment fundraising for such organizations
- It sends a positive signal that the government is bothered about the sector.
- It will help companies to have greater visibility and raise capital. For instance, if an entrepreneur can go to a single platform which he knows will be touched by a hundred investors, it becomes easier for him
- Listing on an exchange can be a viable alternative for impact startups to raise funding
- In India, the social impact startups are growing at 20 per cent annual rate while there are more than 400 such startups

Potential:

- The proposal has attracted much attention, and social entrepreneurs, among others, have said that the move can have a revolutionary effect on how they tap investors for capital.
- The exchange would help social and voluntary organisations which work for social causes to raise capital as equity, debt or a unit of mutual fund.
- It's good for the government to put in some resources in the creation of what should be viewed as a facilitating institution
- With the government distrustful of foreign donations to nonprofits, the exchange might help the sector generate more capital
- The proposal would be a radical experiment in a country characterised by stark inequality and rapid economic growth.
- If created, the exchange could provide new and cheaper sources of financing for social welfare projects, while showcasing India's independence from foreign aid as it seeks to enhance its position on the world stage.
- SSEs exist in several countries in various forms but there is no clarity about the Indian version yet on trading, tax benefit transferability and accountability of third parties

Social enterprises:

- A social enterprise is a revenue-generating business.
- Its primary objective is to achieve a social objective, for example, providing healthcare or clean energy.

- This in no way means that a social enterprise can't be highly profitable. In fact, most social enterprises look and operate like traditional businesses.
- The only catch is that the profit these entities generate is not necessarily used for payouts to stakeholders, but reinvested into their social programmes.
- **Forus Health**, a social enterprise manufacturing medical devices, with the larger vision of eliminating preventable blindness
- **ImpactGuru** is a donation-based crowdfunding startup serving NGOs, social enterprises, startups and individuals.

Global examples:

- **UK:** The Social Stock Exchange in London functions more as a directory connecting social enterprises and potential investors. Launched in 2013, it only accepts companies that pass its independent assessment on social impact.
- **Kenya:** The Kenya Social Investment Exchange, launched in 2011, connects vetted social enterprises with impact investors, both foreign and domestic. A listed social enterprise has to demonstrate social impact as well as financial sustainability beyond the funding period.
- **Canada:** Backed by the Ontario government, the SVX is an online platform that allows investments in Canadian companies and funds that have "a positive social or environmental impact". Retail investors are also allowed to participate.
- **Singapore:** The Impact Investment Exchange runs a social stock exchange in partnership with the Stock Exchange of Mauritius, which is open to limited accredited investors who want to invest.

Challenges:

- In a survey of Indian social enterprises by Brookings India, 57% identified access to debt or equity as a barrier to growth and sustainability.
- Lack of clarity of Social Enterprise in India.
- There is less clarity about how a stock exchange will help raise capital for "voluntary organisations".
- Social startups possibly lack the flexibility in raising capital from angel or venture capital investors, unlike a regular technology startup.

Way forward:

- The first thing the government needs to decide is how to distinguish between a social enterprise and a normal enterprise.
- It would be innovative if corporate social responsibility funds could be routed to social enterprises through the exchange
- This can help reduce misuse of CSR funds and help companies route funds through a more viable route

Conclusion:

- The Social stock exchange is a step in the right direction to help the cash starved social startups. This will further the cause of socio-economic development with much transparency and accountability.

Q) Provide for an analysis of recently released Global Innovation Index, Discuss the need for innovation and government efforts to promote the same. (250 words)

The hindu

Why this question:

Global Innovation Index 2019 has been released recently.

Key demand of the question:

The question aims to analyse the recently released Global innovation index and the performance made by our country and the efforts of the government in this direction.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Discuss in brief about GII.

Body:

Start with brief on findings of the report.

Discuss the salient features of the report – GII rankings are based on 80 indicators, from traditional measurements like research and development investments and international patent and trademark applications.

Theme for the year 2019 is – Creating Healthy Lives – The Future of Medical Innovation, which aims to explore the role of medical innovation as it shapes the future of healthcare.

It is published by a specialized agency of the United Nations – the World Intellectual Property Organization (WIPO) in association with Cornell University and graduate business school INSEAD.

Then list upon the performance of India and the key findings of the government initiatives in this direction.

Conclusion:

Conclude with way forward.

Introduction:

- The Government of India has launched the Global Innovation Index (GII) in New Delhi. This is the first time that the GII is being launched in an emerging economy.
- The Department for Promotion of Industry and Internal Trade (DPIIT) of Ministry of Commerce and Industry, Government of India, World Intellectual Property Organization (WIPO) and Confederation of Indian Industry (CII) are co hosting the event. India has jumped five places to rank 52 in the Global Innovation Index 2019, up from the 57 it had in last year's rankings.

Body:

Key Findings of Global Innovation Index 2019:

- Public R&D expenditures, particularly in some high-income countries, are growing slowly or not at all.
- Global landscape of science, innovation, and technology has undergone important shifts over the last decades.
- Asian economies especially middle-income one, are rapidly contributing to global research and development (R&D) and international patenting rates via WIPO's International Patent System.

Need for innovation in India:

- Key drivers of economic performance and social well-being.
- It is important to inculcate scientific temper among masses in order to fight superstitions, distorted truth and religious fanaticism that has been crippling India
- Innovation and technological improvement has become essential to combat and adapt to climate change and promote sustainable development,
- It is imperative for combating national security threats ranging from cyber ware to autonomous military systems such as drones.
- Investing in research and providing adequate incentives leads to creation of jobs, especially for the pool of engineers and researchers in the society. Under the 'Make in India' program, the government has targeted to create 100 million jobs from the manufacturing sector by 2022.

Government Efforts:

- Various schemes have been introduced to improve the quality of research institutes, for the promotion of **technology business incubators (Atal Incubation Centres) and research parks** that promote innovative ideas until they become commercial ventures.
- **PM fellowship scheme** aimed at encouraging young, talented, enthusiastic and result-oriented scholars to take up industry-relevant research.
- **Ucchatar Avishkar Yojana:** It aims to promote industry-specific need-based research so as to keep up the competitiveness of the Indian industry in the global market.
- **Atal Tinkering Labs** ensure that dedicated workspaces are created for students to innovate and develop ideas that will go on to transform India.
- Platforms like **"Innovate India"** promote and recognise innovations happening across the nation by enabling citizens to share their innovation.
- **Unnat Bharat Abhiyan 2.0** to help bring transformational change in rural development processes by leveraging knowledge institutions to help build the architecture of an Inclusive India.
- **IMPRINT** India is aimed at adopting engineering and technology as the vehicle to addressing the societal needs and achieving national prosperity
- Forging technology and innovation partnerships with other nations like **India-Israel Innovation Bridge** will act as link between start-ups of India and Israel.
- **PRISM (Promoting Innovations in Individuals, Start-ups and MSMEs):** It is a scheme launched by DSIR (Department of Science & Industrial Research) to support individual innovators with financial grants.

- Various enabling policies like **Science, Technology & Innovation Policy 2013, National Intellectual Property Rights Policy, Technology Vision Document 2035 and Space Vision India 2025** have been framed.

Way forward:

- The Economic Survey recommends doubling national expenditures on R&D with most of the increase coming from the private sector and universities.
- Improve math and cognitive skills at school level
- There is a need to encourage investor-led research. In this direction, the **Science and Engineering Research Board (SERB)** has already been established. It is a promising start that needs to expand with more resources and creative governance structures.
- R & D should focus on technology and extension services that is directly related to common people
- Engage private sector, state government and Indian Diaspora.
- The private sector should be incentivised to undertake and support R&D through **CSR (Corporate Social Responsibility) funds**.
- Growing strength of India's economy and increasing anti-immigrant atmosphere in some Western countries has the potential to attract back scientific Indian Diaspora. Schemes like Ramanujan Fellowship Scheme, the Innovation in Science Pursuit for Inspired Research (INSPIRE) Faculty scheme and the Ramalingaswami Re-entry Fellowship, Visiting Advanced Joint Research Faculty Scheme (VAJRA) should be enhanced to leverage the scientific Diaspora

Topic: Land reforms in India.

Q) What are the major land reforms of India? Why are land reforms needed in Indian economy? Discuss. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

The question seeks to examine the major land reforms in India and their need for the economy.

Key demand of the question:

The answer must discuss the major land reforms in India and their what are their contributions to the Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe briefly the beginning of land reforms in India.

Body:

First explain what you understand by land reforms – Land reforms in India usually refer to redistribution of land from the rich to the poor. Land reforms are often connected with re-distribution of agricultural land and hence it is related to agrarian reforms too.

Start with a narration of Background and History of Land Reforms in India.

Explain the major land reforms that took place in India.

Its role in Indian economy – Equity – now the majority of land in India is enjoyed by a minority of landlords. The inverse relationship between land size and efficiency – the smaller the land, better will be the productivity and efficiency. Owner-cultivation is more efficient than share-cropping etc.

Then discuss the relevant challenges that need focus.

Conclusion:

Conclude with way forward.

Introduction:

- Land Reforms usually refers to redistribution of Land from rich to poor. Land reforms include **Regulation of Ownership, Operation, Leasing, sale and Inheritance of Land**.
- In an agrarian economy like India with massive inequalities of wealth and income, great scarcity and an unequal distribution of land, coupled with a large mass of people living below the poverty line, there are strong economic and political arguments for land reforms.

**Body:****The major land reforms in India:**

- The process of land reform after independence basically occurred in **two broad phases**.

I. First phase:

- The first phase also called the phase of institutional reforms started soon after independence and continued till the early 1960s focussed on the following features:
- Abolition of intermediaries like zamindars, jagirdars, etc.
- Tenancy reforms involving providing security of tenure to the tenants, decrease in rents and conferment of ownership rights to tenants
- Ceilings on size of landholdings
- Co-operativization and community development programmes.

II. Second phase:

- The second phase beginning around the mid- or late 1960s saw the gradual ushering in of the so-called Green Revolution and has been seen as the phase of technological reforms.
- **Digitisation of land records:**
 - Making land records available to all, to contain/check property frauds, became one of the objectives of the government of India in the late 1980s.
 - To address the same, the Digital India Land Records Modernisation Programme (DILRMP) was launched by the government of India in August 2008.
 - The main aim of the programme, was to computerise all land records, including mutations, improve transparency in the land record maintenance system, digitise maps and surveys, update all settlement records and minimise the scope of land disputes.
 - Digitisation would provide clear titles of land ownership that could be monitored easily by government officials, to facilitate quicker transactions. This will also reduce construction timelines and the overall cost for the developer, the benefits of which can be transferred to the consumer, making property prices more attractive.

Need for the land reforms in India:

- To make redistribution of Land to make a socialistic pattern of society. Such an effort will reduce the inequalities in ownership of land.
- To ensure land ceiling and take away the surplus land to be distributed among the small and marginal farmers.
- To legitimize tenancy with the ceiling limit.
- To register all the tenancy with the village Panchayats.
- To establish relation between tenancy and ceiling.
- To remove rural poverty.
- Proliferating socialist development to lessen social inequality
- Empowerment of women in the traditionally male driven society.
- To increase productivity of agriculture.
- To see that everyone can have a right on a piece of land.
- Protection of tribal by not allowing outsiders to take their land.

Conclusion:

- Land reform is the major step of government to assist people living under adverse conditions. It is basically redistribution of land from those who have excess of land to those who do not possess with the objective of increasing the income and bargaining power of the rural poor.
- The purpose of land reform is to help weaker section of society and do justice in land distribution. Government land policies are implemented to make more rational use of the scarce land resources by affecting conditions of holdings, imposing ceilings and grounds on holdings so that cultivation can be done in the most economical manner.

Q) India is facing a problem of fragmented landholdings at present, with nearly 67% of Indian farmers possessing land holdings below 1 hectare. Under such conditions discuss the need for appropriate land reforms. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

The question is based on the theme of land reforms and in what way they are the need of the hour.

**Key demand of the question:**

The answer must discuss the burning issue of declining land area and the issue of fragmentation.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Begin with facts substantiating prevalent conditions of land fragmentation.

Body:

Discussion should include the following:

- Start by bringing out the challenge of land fragmentation, discuss the reasons, concerns associated with it.
- Explain that the main objective of the land reforms programme is to do away with the existing inequalities in the system of landholding and to increase the agriculture. Thus, explain how land reforms can address the issue of fragmentation.
- Quote examples/case studies to justify better. Suggest cases where land reforms have addressed successfully such situations.

Conclusion:

Conclude that Changing the man-land relations and the man-man relations on land has been a concern for decision-makers and people of a country. Whenever there has been exploitation of landlords or the government's failure to frame the policies, peasants and people's movements targeted the oppressors and policy makers.

Introduction:

- The shrinking size of farms is a major factor responsible for low incomes and farmers distress. The average size of farm holdings declined from 2.3 hectares in 1970-71 to 1.08 hectares in 2015-16. The share of small and marginal farmers increased from 70% in 1980-81 to 86% in 2015-16. The average size of marginal holdings is only 0.38 hectares (less than one acre) in 2015-16. The monthly income of small and marginal farmers from all sources is only around ₹4,000 and ₹5,000 as compared to ₹41,000 for large farmers. The viability of marginal and small farmers is a major challenge for Indian agriculture.

Body:**Need for the land reforms in India:**

- To make redistribution of Land to make a socialistic pattern of society. Such an effort will reduce the inequalities in ownership of land.
- To ensure land ceiling and take away the surplus land to be distributed among the small and marginal farmers.
- To legitimize tenancy with the ceiling limit.
- To register all the tenancy with the village Panchayats.
- To establish relation between tenancy and ceiling.
- To remove rural poverty.
- Proliferating socialist development to lessen social inequality
- Empowerment of women in the traditionally male driven society.
- To increase productivity of agriculture.
- To see that everyone can have a right on a piece of land.
- Protection of tribal by not allowing outsiders to take their land.

Measures needed to achieve the land reforms:

- Land records modernization/computerization- Digital India Land Records Modernisation Programme (DILRMP) has been launched.
- Appropriate land compensation- The Right to Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act, 2013 is meant to provide owners with rightful compensation.
- Land leasing- Model Agricultural Land Leasing Act, 2016 can help in this regard.
- Contract farming- Draft Model Contract Farming Act, 2018 has been released to strengthen rules and regulations regarding this.
- Consolidation of land holdings so that huge machineries can be utilized
- FDI in agricultural sector
- Co-operative farming

- Use of land banks and land pooling

Conclusion:

- Farmer's distress is due to low prices and low productivity. The suggestions, such as limited procurement, measures to improve low productivity, and consolidation of land holdings to gain the benefits of size, can help in reducing agrarian distress.
- The time has come to bring requisite changes in the relevant laws governing the cooperative sector with a view to encourage farmers in the context of changed techno-economic and business scenario to make the farming viable and vibrant enterprises. We need a long-term policy to tackle the situation.

Q) “Apart from enhancing and improving agricultural productivity, land reforms are key drivers of social equity”. Comment. (250 words)

Reference

Why this question:

The question is straightforward and must discuss the role of land reforms in bringing social equity.

Key demand of the question:

Explain in detail the role of land reforms in enhancing Agri productivity of the country and also in what way they ensure social equity.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Discuss in brief the importance of land reforms.

Body:

Explain what are the effects of land reforms.

How does it bring increased Agri productivity?

What role do land reforms play in bringing social equity? – explain with example. Explain the following aspects –

1. Land equity: Marginalized farmers got ownership over more land area and thus increase in social status.
2. Credit access and increased food production > increase in income > filled the gap of income inequality.
3. Abolition of zamindari curtailed exploitative practices such as beggar, bonded labour.
4. Though land reforms had limited success due to loopholes in law, corruption, these reforms changed the shape of Indian agrarian system. Land reforms are still going on e.g. Benami Act, Computerizations etc.

Conclusion:

Conclude by suggesting importance of land reforms in social equity.

Introduction:

- Land reforms in India usually refer to redistribution of land from the rich to the poor. Land reforms are often connected with re-distribution of agricultural land and hence it is related to agrarian reforms too.
- Land reform legislation in India consisted of four main categories — tenancy reform, abolition of intermediaries, land ceiling, and land consolidation.

Body:

Objectives of land reforms:

- To enhance the productivity of land by improving the economic conditions of farmers and tenants so that they may have the interest to invest in and improve agriculture
- To ensure distributive justice and to create an egalitarian society by eliminating all forms of exploitation
- To create a system of peasant proprietorship with the motto of land to the tiller
- To transfer the incomes of the few too many so that the demand for consumer goods would be created.

Land Reforms and Agricultural Productivity:

- Earlier large tracts of wasteland belonging to zamindars/ big farmers remained uncultivated. These lands were given to landless labourers as a result of which there is increase in area under cultivation leading to food security.
- Equal distribution of land will encourage intensive cultivation resulting in increased agricultural production leading to higher production levels.
- Some farm management studies conducted in India testified that small farms yielded more production per hectare. It is so because family members themselves cultivate small farms.
- Even one hectare of land is also an economic holding these days on account of improvement in agricultural technique. Hence, small size of holding due to ceiling will not have any adverse effect on agricultural production.
- Atleast some of the Land owners shifted to direct ‘efficient’ farming in order to get ‘exemption’ from land ceiling.

- Consolidation of landholdings ensures that small bits of land belonging to the same small landowner but situated at some distance from one another could be consolidated into a single holding to boost viability and productivity.

Land reforms and Social Equity:

- In a land-scarce country with a significant section of the rural population below the poverty line, the case for ensuring that everyone has access to some minimum amount of land seems compelling from the point of
- In a rural economy, whoever controls land, controls the power.
- The tenancy laws have given the tillers protection from exploitation by providing them security of tenure and fixing maximum chargeable rents.
- Land ceiling reduced this power inequality among villagers.
- The intermediary rights have been abolished. India no longer presents a picture of feudalism at the top and serfdom at the bottom.
- Promoted spirit of cooperation among villagers.
- It will help develop cooperative farming

Way forward:

- Adoption of model land leasing law as suggested by Niti Ayog to aid in drawing private investment to agriculture.
- Promoting cooperative farming by establishing cooperatives at village level.
- Governments providing the farm equipment's and machineries on lease to small and marginal farmers to increase the productivity
- Achieving the convergence of MNREGA with farming to address the issue of farm labour crisis haunting agricultural sector.

Conclusion:

- Land reforms have upheld the socialistic directive principles of state policy which aims at equitable distribution of wealth. However, there have been challenges which need to be overcome to attain the true objectives of Land reforms.
- The manifold problems of our land are to be solved through the introduction of a suitable land policy.

Q) Recent studies have established that women undertook 80 per cent of farm work in India though only 13 per cent of the land was owned by them, in the backdrop of the statement discuss the causes for policy paralysis in granting entitlements to women in agriculture and farm widows and how can it be addressed ? (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

Raising the issue during Zero Hour, BJD's Cuttack MP Bhartruhari Mahtab cited an Oxfam report — published a decade ago — which stated that women undertook 80 per cent of farm work in India though only 13 per cent of the land was owned by them.

Key demand of the question:

The answer must analyse the policy paralysis that has led to failure in addressing the entitlement rights to women in agriculture. One has to analyse in detail the issues on ground and suggest how to tackle the issue.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Quote facts showing the scenario of agriculture in India and the gender aspect.

Body:

One has to explain what are the problems with respect to women in Indian farm sector, why is there a policy paralysis in granting entitlements to women in agriculture and farm widows needs to be addressed.

Discuss issues related to tenure security, and most importantly, the chasm between land 'ownership, accessibility to entitlements, and control,' are important challenges affecting the economic

empowerment of women in agriculture. One example here is that of proxy sarpanches or 'sarpanchpatis,' where the control is often vested with the husband of the elected woman representative under the aegis of Panchayati Raj Act (1993).

Suggest what needs to be done.

Conclusion:

Conclude with way forward.

Introduction:

- The Economic survey 2017-18 recognised and spoke of the need for women farmers to get access to land, water, credit, technology and training.
- According to Food and Agriculture Organization, if women farmers had the same access to resources as men, they would increase output by 20-30% which would mean a dramatic reduction in hunger. This could raise total the agricultural output in developing countries by up to 4%.

Body:

Role of women in farming on India

- Swaminathan, the famous agricultural scientist describes that it was woman who first domesticated crop plants and thereby initiated the art and science of farming.
- Over the years, there is a gradual realization of the key role of women in agricultural development and their vital contribution in the field of agriculture, food security, horticulture, processing, nutrition, sericulture, fisheries, and other allied sectors.
- Agriculture in India is significantly dependent on women. Women make up about 33% of cultivators and about 47% of agricultural labourers in rural India. Overall, the percentage of rural women who depend on agriculture for their livelihood is as high as 84%.
- Women have played and continue to play a key role in the conservation of basic life support systems such as land, water, flora and fauna. They have protected the health of the soil through organic recycling and promoted crop security through the maintenance of varietal diversity and genetic resistance.
- The rate of women in poultry farming at household level is the central in poultry industry.
- Women farmers in India perform most of the big farming jobs, from sowing to harvesting, yet their access to resources is less than their male counterparts. Closing this gender gap is essential in order to accelerate the pace of growth in the agriculture sector.
- Maintaining the ancillary branches in this sector, like animal husbandry, fisheries and vegetable cultivation, depends almost solely on women.

Challenges faced:

- **Land ownership issues:**
 - The biggest challenge is the powerlessness of women in terms of claiming ownership of the land they have been cultivating.
 - In Census 2015, almost 86% of women farmers are devoid of this property right in land perhaps on account of the patriarchal set up in our society.
 - Women have just a dismal 12.8% of holdings despite being crucial to the whole production chain from farm to market.
 - Despite a huge presence in farming, women in Uttar Pradesh own a little under 18% of the land, and in Kerala it is just 14%. In other words, women can labour on farms but cannot hope to own them. Since land is passed on through inheritance, it is usually handed down to male heirs.
 - Notably, a lack of ownership of land does not allow women farmers to approach banks for institutional loans as banks usually consider land as collateral.
 - As of now, women farmers have hardly any representation in society and are nowhere discernible in farmer's organisations or in occasional protests. They are the invisible workers without which the agricultural economy is hard to grow.
 - A declining size of land holdings may act as a deterrent due to lower net returns earned and technology adoption.
- **No political will:**
 - Unfortunately, the role of women in farming has got no mention at all among political parties and very little among policy-makers.
 - Not much focus on gender inclusiveness in agriculture.

**Measures needed:**

- Research worldwide shows that women with access to secure land, formal credit and access to market have greater propensity in making investments in improving harvest, increasing productivity, and improving household food security and nutrition.
- Provision of credit without collateral under the micro-finance initiative of the National Bank for Agriculture and Rural Development should be encouraged.
- Better access to credit, technology, and provision of entrepreneurship abilities will further boost women's confidence and help them gain recognition as farmers.
- The possibility of collective farming can be encouraged to make women self-reliant. Training and skills imparted to women as has been done by some self-help groups and cooperative-based dairy activities (Saras in Rajasthan and Amul in Gujarat).
- These can be explored further through farmer producer organisations. Moreover, government flagship schemes such as the National Food Security Mission, Sub-mission on Seed and Planting Material and the Rashtriya Krishi Vikas Yojana must include women-centric strategies and dedicated expenditure.

Way forward:

- Formal education, availability of economically viable agricultural machinery for women, training, extension services, social engineering, and gender budgeting is need of the hour.
- Gender budgeting would assess the quantity and adequacy of allocation of resources for women and establish the extent to which gender commitments are translated into budgetary commitments.
- Agricultural extension efforts should help women improve food production while allowing them to shift more of their labour to export production.
- The government plans to launch an awareness campaign looking at how Agricultural Science Centres (Krishi Vigyan Kendra) can play a significant role in empowering women farmers and shifting existing, biased perceptions of women's roles in agriculture.
- An 'inclusive transformative agricultural policy' should aim at gender-specific intervention to raise productivity of small farm holdings, integrate women as active agents in rural transformation, and engage men and women in extension services with gender expertise.
- Similarly, changes in legal, financial, and educational systems must be undertaken in order to enhance women's social and economic contributions to rural development in the long term.
- There is a need to examine carefully the implications of land tenure laws and regulations for women and educational policies and funding must be changed to reflect the very high social and economic returns to women's primary education and literacy.
- The differential access of women to resources like land, credit, water, seeds and markets needs to be addressed.

Topic: Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

Q) Agriculture is possibly the most environmentally destructive human activity, high yields coupled with lower greenhouse gas emissions, which GM crops have been proven to provide, are absolutely essential for a sustainable future. Critically analyse. (250 words)

[livemint](#)

Why this question:

The article argues for the benefits that GM crops have for India.

Key demand of the question:

The answer must weigh the pros and cons of GM crops and use of such technology in doubling farmer's income. One must justify in what way using GM crops is more of a boon than bane.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Describe first the context of question.

Body:

The answer discussion should have the following aspects discussed in detail:

How do GM crops increase yield?

How do GMOs benefit farmers?

Can GMOs improve food security?

What are the roles of GMO in agricultural industry?

Explain if GM Crops Increase Farmer Profits and Environmental Sustainability?

Quote facts and figures from various reports and form a balanced and fair opinion.

Conclusion:

Conclude with a positive note.

Introduction:

- Agrarian distress in India is at its peak with very poor remuneration to farmers leading to increasing farmer suicides, protests and loan waivers. Farmers are now trying to find alternative solutions to their problems including the consideration of debated GM crops.
- Recently, in Maharashtra, the farmers' organisation Shetkari Sanghatana (SS) announced that its members would be planting genetically modified (GM) herbicide-tolerant (HT) Bt cotton. HT Bt cotton is not allowed in India, and growing any GM crop illegally attracts five-year imprisonment and a ₹1 lakh fine.

Body:

Advantages of GM Crops other than pest resistance:

- **Food Security:** Given the increased growth of global population and increased urbanisation, GM crops offer one of the promising solutions to meet the world's food security needs. DMH-11's yield is 25% higher than the best non-GM seeds available in India. However, activists went ballistic and the government has backed off.
- **Improved Stress Tolerance:** Genes that give greater tolerance of stress, such as drought, low temperatures or salt in the soil, can also be inserted into crops. This can extend their range and open up new areas for food production.
- **Faster Growth:** Crops can be altered to make them grow faster, so that they can be cultivated and harvested in areas with shorter growing seasons. This again can extend the range of a food crop into new areas or perhaps allow two harvests in areas where only one is currently practical.
- **More Nutritious Crops:** Plants and animals can be engineered to produce larger amounts of essential vitamins and minerals, such as iron, helping to solve nutrition problems in some parts of the world. They can also be altered to change the amounts of protein, carbohydrates, and saturated and unsaturated fats that they contain. This could lead to the production of foods designed specifically for a healthy diet for all consumers.
- **Resistance to Herbicides:** Crops can be modified to be resistant to specific herbicides, making it much easier to control troublesome weeds. Farmers can simply apply the weed killer to a crop field, killing the unwanted plants and leaving the food crop unaffected. For example, GM oilseed rapeseed – the source of canola oil – is resistant to one chemical that's widely used to control weeds.
- **Economic benefits:** GM crops can increase yield and thus income. Genetically modified foods have a longer shelf life. This improves how long they last and stay fresh during transportation and storage. India imported about ₹80,000 crore worth of edible oils last year, and the bill keeps growing.
- **Case study: Bt Brinjal:** Bt brinjal was approved by the GEAC in 2009 but, under pressure from activists, the government disallowed its planting. Bangladesh, using the same GEAC report, went ahead. Today, about 17% of the country's brinjal farmers grow Bt brinjal, which has reduced pesticide costs for GM crop farmers by 61%. The Bangladeshi Bt brinjal farmer's net returns per hectare are six times his non-Bt counterpart's per year.
- **Environmental Benefits:**
 - In 2017, 189.8 million hectares of biotech crops were planted in 24 countries (and consumed in 67).
 - To achieve the same yield standards, more than 300 million acres of conventional crops would have been needed.
 - According to UK consultancy firm PG Economics, the first 20 years of biotech crops (1996-2016) have seen a reduction of pesticide spraying by 671.2 million kg and the environmental footprint associated with pesticide use by 18.4%.

- The figures for 2016: The drop in release of greenhouse gas emissions was equivalent to removing 16.75 million cars from the roads; the direct global farm income benefit from GM crops was \$18.2 billion, equal to an average increase in income of \$102 per hectare.
- And in these 23 years of GM agriculture, there has not been a single authenticated health hazard case specific to it.

Concerns/Challenges associated with GM Crops:

- **Human Health Risks:**
 - Potential impact on human health including allergens and transfer of antibiotic resistance markers.
 - The impact of growing GM crops poses risks to human health as their resistance to antibiotics can turn medicines ineffective and may result in the formation of new toxins and allergens.
 - Toxins produced by GM crops can not only affect non target organisms but also pose the danger of unintentionally introducing allergens and other anti-nutrition factors in foods.
- **Bio safety concerns:**
 - They can reduce species diversity.
 - For example, Insect-resistant plants might harm insects that are not their intended target and thus result in destruction of that particular species.
 - Cross-pollination in GM crops paves the way for herbicide-resistant super weeds that can further threaten the sustenance of other crops and pests because of its uncontrolled growth
 - GM technology could also allow the transfer of genes from one crop to another, creating “super weeds”, which will be immune to common control methods.
 - Viral genes added to crops to confer resistance might be transferred to other viral pathogens, which can lead to new and more virulent virus strains.
- **Implications on Farmers and Consumers:**
 - Critics claim that patent laws give developers of the GM crops a dangerous degree of control over the food supply. The concern is over domination of world food production by a few companies
 - National Institute of Agricultural Economics and Policy Research’s anticipation that Bt brinjal’s high yield and increased shelf life will benefit consumers and farmers owing to cut in retail price of brinjals ignores the scenario that companies might charge premium prices for Bt brinjal seeds, in which case farmers may not benefit at all.
- **Economic Concerns:**
 - Introduction of a GM crop to market is a lengthy and costly process. It has not resulted in high yields as promised.
 - For instance, the highest yields in mustard are from the five countries which do not grow GM mustard — U.K., France, Poland, Germany and Czech Republic — and not from the GM-growing U.S. or Canada.
- **Inefficient Regulatory system:**
 - Seeing the lapses in the regulatory system and irregularities in the assessment of Bt brinjal (in terms of labelling and unapproved and illegal sowing of GM crops) Parliamentary Standing Committee on Agriculture and the Committee on Science & Technology, Environment and Forests recommended:
 - A thorough probe by a team of eminent independent scientists and environmentalists for commercialization of GM crops.
 - Endorsed labelling GM foods to protect a consumer’s right to know.
- **Ethical Concerns:**
 - Violation of natural organisms’ intrinsic values by mixing among species.
 - There have also been objections to consuming animal genes in plants

Way Forward:

- The government must take decisions on GM technologies on the basis of scientific evidence.
- Need to start cultivating an environment of openness and transparency to allay genuine fears
- The government should adopt a participatory approach to bring together all stakeholders to develop regulatory protocols that restore trust in the process.
- There is a significant uncertainty over their safety, so precautionary principle is that country shall wait till a broader scientific consensus is achieved.
- Need for better policy, pricing and to rationalize the input costs
- GEAC needs to be a transparent body. it should put it in the public domain that on what grounds it has approved GM mustard

- There has to be strong liability laws if there are any environmental hazards or if something goes wrong in future
- Agriculture is a state subject therefore, it is important for the Centre to take into consideration the views of State Governments as well.
- The Food and Agriculture Organization (FAO) has rightly pointed out in 2004, "Science cannot declare any technology completely risk free. Genetically engineered crops can reduce some environmental risks associated with conventional agriculture, but will also introduce new challenges that must be addressed".

Q) Discuss the significance of ICT / E-technology in intensifying the reach of extension services to farmers in the country. (250 words)

Reference

Why this question:

The question is direct and is about discussing the role of ICT in extending services to farmer communities of the country.

Key demand of the question:

Explain in detail role played by E- technology/ICT in aid of farmers.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief on what are the ICT/e-technology services available for farmers in the country.

Body:

The application of Information and Communication Technology (ICT) in agriculture is increasingly important. E-Agriculture is an emerging field focusing on the enhancement of agricultural and rural development through improved information and communication processes. More specifically, e-Agriculture involves the conceptualization, design, development, evaluation and application of innovative ways to use information and communication technologies (ICT) in the rural domain, with a primary focus on agriculture. ICT promises a fundamental change in all aspects of our lives, including knowledge dissemination, social interaction, economic and business practices, political engagement, media, education, health, leisure and entertainment.

ICTs are most natural allies to facilitate the outreach of Agricultural Extension system in the country. Despite large, well-educated, well-trained and well-organized Agricultural extension manpower, around 60% of farmers in the country still remain un-reached, not served by any extension agency or functionary.

Conclusion:

Conclude that information per se is not enough, but appropriate communications systems are needed to ensure that information come to farmers in an effective, accurate and clear way.

Introduction:

- Extension and advisory services are relevant to smallholder farmers, who remain the bedrock of the agricultural and food supply chains in India.
- ICTs are very useful in agricultural extension and advisory services and in facilitating reaching out to small and marginal farmers.
- Extension and Advisory services play a crucial role in **promoting agricultural productivity, increasing food security, improving rural livelihoods.**

Body:

- **E-Agriculture** is an emerging field focusing on the enhancement of agricultural and rural development through improved information and communication processes.
- More specifically, e-Agriculture involves the conceptualization, design, development, evaluation and application of innovative ways to use information and communication technologies (ICT) in the rural domain, with a primary focus on agriculture.

Significance of ICT / E-technology in intensifying the reach of extension services to farmers in the country:

- Improve the wellbeing of individuals and communities
- Change production systems so that they improve rural livelihoods and sustain the resource base

- Improve agriculture and the social, economic and political status of rural communities
- Improve the wellbeing of farm families
- Improve productivity and livelihoods for farmers
- Increase and improve farmers' incomes and productivity on a sustainable basis
- Enhance farmers' production
- Attain higher levels of efficiency in the farm enterprise
- Attain food security and improve rural livelihoods.

ICT tools can help in meeting the challenges in agricultural development in the following ways:

- **Land mapping:** Using satellite data and remote sensing, farmers can get real time information about soil moisture, water level etc. Soil quality assessment with help of remote sensing and tools for assessing the feasibility of crops.
- **Soil and Water Testing Laboratories:** These Testing Labs spreads across the country educate the farmers about various scientific tools for identifying superb soil and water for agricultural purposes
- **Land record maintenance:** This can also help in the measurement of the plots, land fragmentation etc.
- **Weather information:** Advanced information about adverse weather condition, so that farmers can take precautionary measures.
- **Credit and finance:** Information regarding agrifinance, agriclincs and agribusiness. Banking facilities like mobile banking, DBT of subsidies can be done easily.
- **Agri-Marketing:** Real time and near real times pricing and market information. E.g.: e-NAM
- It is as a powerful tool when combined with price incentives, input supply, credit, seed multiplication.
- **Agri-Price Support:** Market intervention scheme involving procurement through a notified agency like Commission for Agriculture Costs and Prices, Agricultural & Processed Food Products Export Development Authority (APEDA), and Marketing Research and Information Network (AGMARKNET) etc, can surely be of great help in assuring fair returns to farmers.
- **Advisory services:** Agriculture Information, Awareness and Education.
- **Government Initiatives:** Information dissemination about various government schemes.
- **Discussion portals:** Online Farmer Communities to discuss the trends, issues etc.
- **Allied sector information:** in order to help farmer sustain and increasing income through beekeeping, fishery, animal husbandry. Recently , Mushroom farming on stubble left is being promoted through information dissemination in Punjab
- It acts as an intermediary link between agricultural development institutions such as research institutes, universities, colleges of agriculture and target groups
- The agricultural extension services mainly concentrated on to strengthen the agricultural system by empowering farmers in terms of health, education, livelihood and income.

Key Government initiatives to promote use of ICT in agriculture include **National e-Governance Plan in Agriculture (NeGP-A)**, various **Touch Screen Kiosks**, **Krishi Vigyan Kendras**, **Kisan Call Centres**, **Agri-Clinics**, **Common Service Centers**, **mKisan**, **Kisan TV** and various other applications.

- In India ICT applications such as **Warana**, **Dristee**, **E-Chaupal**, **E-Seva**, **Lokmitra**, **E-Post**, **Gramdoot**, **Dyandoot**, **Tarahaat**, **Dhan**, **Akshaya**, **Honeybee**, **Praja** are quite successful in achieving their objectives.

Conclusion:

- The implementation of rural ICTs involves organizational and social change.
- Information is vital to tackle climate change effects: for this reason, a shift is needed in the agriculture sector to disseminate appropriate knowledge at the right time to the ones who are at the frontline in the battle: the farmers, in both developed and developing countries.

Q) From both economic and environmental perspectives, cultivation of pulses is the most optimal choice.” Explain. (250 words)

Ethics by Lexicon publications

Why this question:

The question is based on the premise of cultivation of pulses and its significance in the current times.

Key demand of the question:

Explain in detail the relevance of cultivation of Pulses to the agrarian system of the country.

**Directive:**

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

Discuss the context of the question.

Body:

Explain why pulses are the optimal choice and in what way they are the right choice from the economic and environmental standpoints.

List the benefits of cultivating pulses, Pulses are rich in proteins and found to be main source of protein to vegetarian people of India, can be grown on all types of soil and climatic conditions, being legumes fix atmospheric nitrogen into the soil, helpful for checking the soil erosion as they have more leafy growth and close spacing etc.

Conclusion:

Conclude by how they can act as a shock absorbent for farmers in distress and take care of both environmental and economic aspect.

Introduction:

- Pulses occupy an important place in Indian agriculture. They provide protein and fibre, and are a great source of vitamins and minerals such as iron, zinc and magnesium. In India, pulses are grown over an area of 2.38 crore hectares with a total production of 1.86 crore tonnes.
- The average yield of pulses in India is about 735 kg/hectare. Pulses are generally grown in irrigated as well as rainfed area and belong to **leguminaceae** family. Madhya Pradesh is the leading state in India in pulses, in terms of cultivated area and productivity.

Body:**Environment benefits:**

- Pulse crops are important components of production systems that are resilient to climate change.
- Pulses are able to convert nitrogen in the atmosphere into compounds in the soil. This process is known as nitrogen fixation.
- Some (types) of pulses are also able to free soil-bound phosphorous. Both nitrogen and phosphorus are essential nutrients for growing plants.
- The ability to produce them naturally drastically reduces the need for synthetic fertilizers and pesticides while at the same time improving yields.
- The less fertilizers and pesticides applied, the lower the risk of environmental contamination and unintended effects on the environment.
- Including pulses in intercropping farming systems and cultivating them as cover crops not only reduces the need for synthetic fertilizers, but also helps reduce soil erosion, thus contributing to the creation of healthy soils.
- Healthy soils, are in turn, better able to retain moisture and facilitate the uptake of nutrients by plants.
- Pulses in general need lesser water compared to rice, wheat and sugarcane. This in turn helps in conserving the dwindling ground water resources and help the dry-land farming grow.
- The reduced need for synthetic fertilizers indirectly reduces the level of greenhouse gases released in the atmosphere.
- Fertilizers are energy intensive and a significant source of emissions. At the same time, pulses also promote higher rates of accumulation of soil carbon than cereals or grasses.
- Including pulses in intercropping farming systems and cultivating them as cover crops creates a more diverse environment at the field level.
- This, in turn, supports a broader range of insects and “wildlife” above ground and in the range of bacteria and fungi in the soil.
- The presence of this broader range of insects and microbial life provides for a more resilient “ecosystem” that helps keep harmful insects, diseases and pathogens in check, thus reducing the need (to) use pesticides.
- There are hundreds of different varieties of pulses and only a limited number of these are widely grown.
- It is from this diversity that climate-resilient varieties (which are adaptive) to changes in temperature and have the ability to grown in poor soils or under drought conditions can be derived.

- Since climate experts suggested that heat stress will be the biggest threat to bean production in the coming decades, the improved pulse varieties will be of critical importance, especially for low-input agricultural production systems.

Economic benefits:

- Pulses contribute to food security in a number of ways.
- They represent an important source of food.
- They can be a source of income for the farmer, simply by selling some of what has been produced.
- The possibility of further processing or value addition may be another source of revenue while also generating employment opportunities.
- The crop residues left after harvest may be used to feed livestock, further contributing to a diversified diet and potential source of income.
- Pulses production can help curb the import bill of the country which can be used for other socio-economic development.
- Minimum support price for pulses is expected to help push up their output and thereby contain food inflation

Way forward:

- New research efforts should be initiated to achieve a breakthrough in the productivity.
- Innovative ideas need to be implemented instead of conducting routine research and material evaluation.
- Scientists to work for development of shorter duration, widely adaptable and biotic and abiotic stress resistant varieties to boost the production of pulses.
- Modernization of pulse breeding programme, supporting genetic gains through transgenic technology, enhancing biological nitrogen fixation through development of super nodulating plant types and breeding short duration varieties for achieving self sufficiency in pulses.
- Extension workers and agriculture technology information centers should work more towards development and dissemination of newer technologies.

Conclusion:

- India need to produce 40-50 lakh tonnes of additional pulses for meeting the domestic requirement and this can be possible only if we develop high yielding short duration, drought and insect-pest resistance varieties of pulses.
- The important role that pulses can play in **sustainable crop production systems, in particular through their contribution to improved soil fertility and to agro-biodiversity** along with **providing a balanced and healthy diet as evidenced by their use by the World Food Programme and other food aid initiatives** makes it a naturally optimal choice.

Q) Discuss the key features of Paramparagat Krishi Vikas Yojana (PKVY) and evaluate its contributions in promoting organic farming in India. (250 words)

[Vikaspedia](https://www.insightsias.com/vikaspedia)

Why this question:

The question is about evaluating the scheme of Paramparagat Krishi Vikas Yojana (PKVY).

Key demand of the question:

The answer must discuss the key features, objectives and significant role played by Paramparagat Krishi Vikas Yojana (PKVY) in boosting the organic farming system of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe in brief coming of Paramparagat Krishi Vikas Yojana (PKVY).

Body:

The body of the answer should discuss the following aspects:

Explain that Paramparagat Krishi Vikas Yojana is an elaborated component of Soil Health Management (SHM) of major project National Mission of Sustainable Agriculture (NMSA).

Discuss its implementation of the program and in what way it has contributed to organic farming and its development in India.

Conclusion:

Conclude with its importance.

Introduction:

- The Paramparagat Krishi Vikas Yojana (PKVY) – traditional farming improvement programme was launched in 2015. It is an extended component of Soil Health Management (SHM) under the Centrally Sponsored Scheme (CSS), National Mission on Sustainable Agriculture (NMSA).
- PKVY aims at supporting and promoting organic farming, reduction in dependence on fertilizers and agricultural chemicals, in turn, resulting in improvement of the soil health while increasing the yields.
- Organic food, thus produced will be linked with modern marketing tools and local markets. The revamped PKVY promotes organic farming through the adoption of organic village by cluster approach and Participatory Guarantee System of certification.

Body:

Objective of the scheme:

- Promote organic farming among rural youth, farmers, consumers and traders.
- Disseminate latest technologies in organic farming.
- To utilise the services of experts from the public agricultural research system in India.
- Organise a minimum of one cluster demonstration in a village.

Contributions of PKVY to organic farming promotion:

- Groups of farmers would be motivated to take up organic farming under Paramparagat Krishi Vikas Yojana (PKVY).
- Fifty or more farmers will form a cluster having 50 acre land to take up the organic farming under the scheme.
- In this way during three years 10,000 clusters will be formed covering 5.0 lakh acre area under organic farming.
- There will be no liability on the farmers for expenditure on certification.
- Every farmer will be provided Rs. 20,000 per acre in three years for seed to harvesting of crops and to transport produce to the market.
- The produce will be pesticide residue free and will contribute to improving the health of the consumer.
- Organic farming will be promoted by using traditional resources and the organic products will be linked with the market.
- It will increase domestic production and certification of organic produce by involving farmers
- Adoption of Participatory Guarantee System (PGS) certification through cluster approach
- Adoption of organic village for manure management and biological nitrogen harvesting through cluster approach

However, challenges remain:

- The Centre's free organic certification programme "the Paramparagat Krishi Vikas Yojana" has not picked up as most States have failed to utilise the funds set aside for the scheme.
- A 2018 report on the implementation of PKVY highlights that all states, except Tripura, Odisha and Karnataka, have failed to utilise even 50 per cent of their funds under the scheme.
- While the Centre has increased allocation for the scheme by 44 per cent for the current year, corrective measures are needed to ensure that the states become responsible and contribute toward "organic India".

Conclusion:

- With the increase in global health consciousness, organic food is set to knock every door and make its way in healthy kitchens worldwide. People the world over use organic food as a hygiene factor rather than a product by itself.
- Organic food is a holistic approach in the Indian environment which starts at the farm and ends at the fork of the consumer. The way forward is to support the change in a gradual manner. A holistic and community-driven approach, similar to the "Swachh Bharat" for "Swachh Food" needs to be undertaken.

Q) Explain the different types of agriculture revolutions that took place post Independence in India. Also explain how these revolutions have helped in bringing food security in India ? (250 words)

Indian geography by Majid Hussain, Indian economy by Dutt and Sundaram

Why this question:

The question is straight forward and is about discussing the agrarian revolutions that India witnessed post-independence.

Key demand of the question:

The answer must discuss the contributions of Agrarian revolutions in India and role played by them in ensuring food security in India.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief on significance of important agrarian revolutions in India that started immediately after post-independence.

Body:

Discussion should include the following:

- India is primarily an agricultural economy and majority of people are still dependent on agriculture for their livelihood. After independence, development of agriculture has been assured by various revolutions supported by government.
- Green Revolution – This revolution led to tremendous rise in production of food grains, especially wheat, by use of high-yielding varieties of seeds, fertilizers and pesticide.
- White Revolution – Operation Flood (1970), an initiative of National Dairy Development Board has led to revolution in milk production in India. The world's largest dairy development programme transformed India from a milk deficient nation to world's largest milk producer.
- Blue Revolution – This revolution focused on management of fisheries sector and has led to phenomenal increase in both fish production and productivity from aquaculture and fisheries resources of the inland and marine fisheries.
- Other revolutions which are no less significant includes yellow revolution (oil seed production), golden fibre revolution (jute), golden revolution (horticulture), silver fibre revolution (Cotton) and red revolution (meat production).
- Then suggest their contributions/significance. And conclude that To further the momentum of these programmes and assure food security in long run in face of ever increasing population, there is an urgent need for an 'evergreen revolution' that should focus on all round development of the agriculture sector.

Conclusion:

Conclude with way forward.

Introduction:

- India is primarily an agricultural economy and majority of people are still dependent on agriculture for their livelihood. After independence, development of agriculture has been assured by various revolutions supported by government.
- The Agricultural Revolution or Agrarian Revolution refers to the significant change in agriculture that occurs when there are discoveries, inventions, or new technologies that changes the production.

Body:

| Revolutions | Contributions/significance |
|------------------|---|
| Green Revolution | <p>It stands for a major technological breakthrough in India based on:</p> <ol style="list-style-type: none"> 1. Improved seeds of high yielding varieties 2. Adequate and assured supply of water for irrigation 3. Increased and appropriate application of chemical fertilizers for increasing agricultural production. |
| White Revolution | <p>It stands for remarkable increase in milk production and establishment of a national milk grid, removing regional and seasonal imbalances. Among the technological inputs are:</p> <ol style="list-style-type: none"> 1. Cross-breeding of indigenous cows with high milk yielding European breed 2. Pasteurisation of milk for keeping it for a longer duration 3. Collection of quality milk from members in rural areas 4. Refrigerated transport system which helps sending milk to far-off metropolitan centres both by road and rail |

| | |
|-------------------------|--|
| Blue revolution | It refers to big rise in catching of freshwater and marine fish. |
| Golden Revolution | Overall Horticulture development/Honey Production |
| Pink Revolution | It is a term used to denote the technological changes in the meat and poultry processing sector. |
| Yellow Revolution | It refers to remarkably steady and assured supply of Oil Seeds production. |
| Red Revolution | Meat and Tomato Production |
| Silver Fibre Revolution | Cotton Revolution |

Agricultural Revolution and Food Security:

- These innovations in agriculture have lifted millions of people out of poverty by generating rural income opportunities for farmers, farm labourers, and also reduced prices for consumers. India has become self sufficient in food grain production with the help of green revolution.
- The exponential rise in milk production has led to nutritional security among the masses. Per capita availability of milk has reached all time high of 337gms/day.
- These steps have provided avenues for income diversification for farmers.

Conclusion:

- To further carry on the momentum of these programmes and assure food security in long run in face of ever increasing population, there is an urgent need for an 'evergreen revolution' that should focus on all round development of the agriculture sector.
- The concept of Rainbow revolution is an integrated development of crop cultivation, horticulture, forestry, fishery, poultry, animal husbandry and food processing industry is the need of the hour.

Q) What do you understand by Cooperative farming? How does it contribute to Land reforms? Discuss its limitations and analyse why cooperative farming model has not been very successful in the country. (250 words)

[epw](#)

Why this question:

The question intends to analyse the practice of co-operative farming and its contributions to land reforms.

Key demand of the question:

The answer must first discuss the concept of co-operative farming and then discuss its contributions to land reforms and analyse the limitations and challenges associated.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on what you understand by co-operative farming.

Body:

Discussion should include the following:

Explain that co-operative farming is the practice of pooling of land and practicing joint agriculture.

Discuss its contribution to land reforms, quote examples, success stories where co-operative farming has acted as a game changer.

Explain the limitations/challenges encountered in inculcating the features of the co-operative farming. Then discuss in what way it can be addressed to make it a success story.

Conclusion:

Conclude with way forward.

Introduction:

- Co-operative farming is a voluntary organization in which the farmers pool their resources. The object of this organization is to help each other in agriculture for their common interests.
- In other word it is a co-operative among the farmers of limited means.

**Body:****Co-operative farming and land reforms:**

- In India, majority of the holdings are too small. About 76.4 per cent of the total holdings in India are below the size of 2 hectares and on these again 28.8 per cent of total operated area is engaged into these marginal and small holdings.
- Cultivation in such a small holding is uneconomic and unprofitable.
- Farmers retain their right to land.
- Cooperative farming enables them to consolidate their small units of land for better utilization.
- Solves the problem of sub-division and fragmentation of holdings.

Other benefits:

- **Use of Machinery:** A poor farmer cannot purchase the machinery but a cooperative society can easily purchase the various machines. The use of machines will not only reduce the cost of production but will increase the per acre yield.
- **Supply of Inputs:** A cooperative farming is in a better position to get the adequate and timely supply of essential agriculture inputs like fertilizer and seeds.
- **Creates Love and Brotherhood:** A cooperative farming society creates the brotherhood and love for the members because they work for their common interest.
- **Fair Price of the Product:** A co-operative farming society will bargain in the market and will sell the product at maximum price. The income of the individual farmer will increase.
- **Guidance and Training:** A co-operative society guides the farmer to increase their efficiency and production.

Causes of failure of cooperative farming:

- **Attachment with Land:** The farmers are not willing to surrender the rights of land in favour of the society because they have too much attachment with it.
- **Lack of Cooperative Spirit:** The spirit of cooperation and love is lacking among farmers. They are divided in various sections on cast basis. There is no unity among them, so they are not ready to become the member of the society.
- **Illiteracy:** In poor countries farmers are mostly illiterate and they are not ready accept any change in the cultivation process. Still some of them are using the old methods of cultivation.
- **Lack of Capital:** The co-operative farming societies are also facing the capital shortage problem and these are unable to meet the growing needs of agriculture. Credit facilities to these societies are also not sufficient.
- **Dishonesty:** The management of cooperative often turns out to be dishonest. The selfishness of the members make the cooperative farming society ineffective.
- **Loss of Independence:** Under co-operative farming, farmers face loss of independence in their farming operation which the farmers find it difficult to accept.
- **Re-Payment of Debt:** Sometimes debt is not repaid in time which creates many problems for the financial institutions. Some members do not realize their responsibility and it becomes the cause of failure.

Measures needed:

- The government must invest capital so that the cooperatives become capable to shoulder the responsibility of guaranteeing purchase of crops at remunerative prices, it's storage at Gram Sabha level, ensuring cheaper loans for rural families, providing food grains to poor families under PDS .
- **Kudumbashree of Kerala and AMUL model** are successful models of cooperatisation and there is need to learn from it.
- One must keep in mind the class character of cooperatives and they must be formed on class basis. Cooperative agrarian movement will resolve the questions of caste inequality, sex-based discrimination and environmental conservation.
- Agro-processing units may be installed so that their labour power may be deployed in productive activities other than agriculture.

Conclusion:

- The cooperative farming has been tried successfully in various countries like United Kingdom, Germany, France and Sweden. The agricultural cooperative movement would play a huge role in safeguarding democracy and it may play an inspirational role in mobilising the people in unorganized sector and the youth.

Q) Discuss the role and contributions from agriculture towards India's goal of \$5 trillion economy. What measures need to be taken in agriculture to reach its goal. (250 words)

The hindu

Introduction:

- The President of India spoke of India becoming a "Five Trillion Dollar" economy, last month. It was reiterated by the Prime Minister and was even discussed in the NITI Aayog Governing Council meet.
- India is, currently, a \$2.8 trillion economy; to reach the \$5 trillion mark by 2024, the economy would require nominal growth in dollar terms of over 12% a year. To reach \$ 5 Trillion, we need to shift our perspective from policy to projects.
- However, unless there are adequate investments reforms in primary sectors, steps taken to augment growth in other sectors would be futile.

Body:

Role and contributions from agriculture towards India's goal of \$5 trillion economy:

- **Agri-tourism:** The segments such as agro-processing, and exports, agri-startups and agri-tourism, where the potential for job creation and capacity utilisation is far less. Integrating the existing tourism circuit with a relatively new area of agri-tourism (as a hub-and-spoke model), where glimpses of farm staff and farm operations are displayed to attract tourists, would help in boosting the investment cycle and generate in-situ employment.
- **Education and research in agriculture:** It would serve as a stage to demonstrate resource conservation and sustainable use through organic, natural and green methods, and also zero budget natural farming.
- **Food processing:** according to united nations food and agriculture organisation (FAO), India is home to more than 190 million Indians going hunger daily and at the same time around \$ 14 billion (Rs 96,000 crore) food wastage in India due to lack of proper food storage facilities.
- **Live stock:** In India livestock considered as a supplement to farm income to farmer. But at present day livestock contribution to agriculture GDP is nearly 30%. And many of the livestock farmers earning more than traditional agriculture farmers. India is home to highest number of livestock population in the world, investment should make to utilise this surplus.
- **Foreign direct investment:** according to Invest India report, around 1.5 billion USD foreign investment came to food processing sector. So there is a huge potential to tap in Indian food processing industry.
- **Renewable energy:** investment in renewable energy generation on fallow farmland and in hilly terrain would help reduce the burden of debt-ridden electricity distribution companies and state governments and farmers no need to rely on Discom companies for power supply.
- **Private entities:** Farm business organisation is another source of routing private investment to agriculture. Linking these organisations with commodity exchanges would provide agriculture commodities more space on international trading platforms and reduce the burden of markets in a glut season, with certain policy/procedural modifications.

Global Experiences:

- An earlier experience of BRIC (Brazil, Russia, India and China) nations has shown that a 1% growth in agriculture is at least two to three times more effective in reducing poverty than similar growth in non-agricultural sectors.
- Public investment in agriculture research and development in terms of percentage share in agri GVA stands at 0.37%, which is fairly low in comparison to between 3% and 5% in developed countries.

Measures needed:

- Encouraging public and private investments to develop infrastructure like cold chains;
- Special attention for north-eastern, eastern and rain-fed states for augmenting scope of access to institutional credit;
- Rationalisation and targeting of input subsidies towards small and marginal farmers.
- Reform in land leasing laws to promote land consolidation and contract farming.
- Accelerating the pace of public investment in agriculture and ensure greater efficiency in capital use.
- Loans available through KCC are very low, so the government and RBI should work together to increase the loan amount.
- PPPs could help spur the development of the food processing industry, one of the newest sectors in Indian agriculture.

- present agriculture growth is in declining phase, to revive the agriculture growth need patient capital (as financial returns to investment are unlikely to materialize in the initial years.) like rural infrastructure development fund (RIDF)

Conclusion:

- Agriculture and its allied sectors are believed to be one of the most fertile grounds to help achieve the ambitious Sustainable Developmental Goals (SDGs). However, with the current pace of agriculture growth, India requires 'patient capital', as financial returns to investment are unlikely to materialise in the initial years.
- An inclusive business model facilitating strong investor-farmer relations should be created, with a legal and institutional framework for governance. Expanding institutions is essential to accommodate the developmental impacts of foreign agricultural investment.

Q) Practice of Information, technology and communication in agriculture can achieve the triad of empowerment, enablement and expansion. Comment. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

From the perspective of socio-economic and sustainability of the agricultural system, Information can be a valuable tool, in a sense that it's immaterial, so if we harness the information technology, we can produce more food with less input.

Key demand of the question:

The answer must bring out the significance of ICT in agriculture.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Body:

The relevance of ICT for Agricultural Development in general and for Agricultural empowerment and enablement in particular is extremely high for a country like India. E-agriculture involves the conceptualization, design, development, evaluation and application of innovative ways to use information and communication technologies in the rural domain, with a primary focus on agriculture.

Conclusion:

Technological empowerment is essential for evergreen revolution and E-agriculture has the potential to put India on the higher pedestal of 'Second Green Revolution' by making Indian agricultural sector self-sufficient. However, digital agricultural interventions need to be pro-poor i.e. technology should be economical and affordable in adoption and implementation.

Introduction:

- Information and Communication Technology (ICT) is used as an overarching term incorporating all modes of transmission like electronic devices, networks, mobiles, services and applications which help to disseminate information with the help of technology.
- In the recent years, ICT has proved to be extremely beneficial for farmers including small land holders, marginalized and poor farmers, and helped them in marketing, precision farming and improved profits.

Body:

Role of ICT in Agriculture:

In the context of agriculture, the potential of information technology (IT) can be assessed broadly under two heads:

- as a **tool for direct contribution to agricultural productivity**
- As an **indirect tool for empowering farmers to take informed and quality decisions which will have positive impact on the way agriculture and allied activities are conducted.**

Direct benefits:

- **Precision farming**, popular in developed countries, extensively uses ICT to make direct contribution to agricultural productivity. The techniques of remote sensing using **satellite technologies, geographical information systems, agronomy and soil sciences** are used to increase the agricultural output.

- This approach is capital intensive and useful where large tracts of land are involved. Consequently it is more suitable for farming taken up on corporate lines.

The indirect benefits of ICT

- It empowers Indian farmer in significant way and remains to be exploited. The Indian farmer urgently requires timely and reliable sources of information inputs for taking decisions.
- Access to technology is one of the most important enablers for smallholders to improve productivity sustainably. Innovative mechanisms for technology transfer are required to bring relevant tools, knowledge and knowhow to farmers.
- Market linkages are common weak points between the smallholders and formal supply chains. Intermediaries are required not only to aggregate production from small-scale growers, but also to provide support and services to ensure the quality and consistency of production.
- ICT applications can foster **dissemination of information on technology, market demand and price information; weather, pest, and risk-management information, best practices to meet quality and certification standards.**
- To bridge the information gap between the farmers and to build productive and competitive market, different ICT interventions support rural and under-developed markets to become efficient and productive.
- The rapid changes in the field of information technology make it possible to develop and disseminate required electronic services to rural India. The existing bottlenecks in undertaking the tasks need to be addressed immediately.

Challenges in spread of e-technology to farmers:

Mobile Connectivity:

- Even the masses have access to mobile connectivity, but the potential of the handsets are not yet tapped. This is largely because of the content delivered is often not directly related to their livelihood and environment. Since they need localised news and information directly delivered in their language to meet their daily needs.
- Affordability is a key issue for many potential users. Not everyone can afford handsets; innovative business models adopted by the firms and handsets at low price tag which work for voice and sms based services.
- Other challenge in disseminating agriculture related information is dynamic nature of information. Farming is not so linear but requires constant inputs at every stage where new technological inputs provide better crop outputs.

Internet Connectivity:

- **Haphazard development:**
 - It is observed that some initiatives have already been made to provide IT based services to farmers. However, duplication of efforts are witnessed as most of the services revolve around limited subjects.
 - Keeping in view the giant task involved, it is necessary to form a coordination mechanism to strive for a concerted effort to support farming community in the country. Such a coordination agency may only have advisory powers.
- **User friendliness:**
 - The success of the strategy depends on the ease with which rural population can use the content.
 - This will require easy language, training to farmers and intuitive graphics based presentation.
- **Local languages:**
 - Regional language fonts and mechanisms for synchronisation of the content provides a challenge that needs to be met with careful planning
- **Restrictions:**
 - Information content based on remote sensing and geographical information systems can provide timely alerts to the farmers and also improve the efficiency of administration.
- **Power Supply:**
 - In most of the rural India, power supply is not available for long hours. This will reduce the usefulness of the intended services.
 - Since almost entire country receives sunshine for most part of the year, it is useful to explore solar power packs for UPS as well as for supply of power.
- **Connectivity:**
 - Despite the phenomenal progress made in the recent years, the connectivity to rural areas still requires to be improved.
 - Reliable connectivity is a prerequisite for a successful penetration of IT into rural areas.

In India ICT applications such as **Warana, Dristee, E-Chaupal, E-Seva, Lokmitra, E-Post, Gramdoot, Dyandoot, Tarahaat, Dhan, Akshaya, Honeybee, Praja** are quite successful in achieving their objectives

Conclusion:

- The use of ICT in agriculture has grown rapidly in the past few years. It is increasingly being used to help managers make better decisions. However, IT and the problem facing decision makers are constantly changing.
- Thus, future information systems for research purposes will be significantly different than current systems because of these changes. IT has been one of the most aspired fields in today's world. Integrating IT with agriculture will help any country to regulate its overall economy and trade.

Topic: Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Q) The progress in livestock sector of the country is directly related to a more balanced development of rural economy and upliftment of poorer sections of the society. Comment. (250 words)

Reference

Why this question:

The question is straightforward and is about analysing the role of livestock sector on the rural economy.

Key demand of the question:

The answer must relate the growth of livestock sector and the impact it has on rural economy and life.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Begin with brief introduction on current status of livestock sector in India.

Body:

Explain that Animal Husbandry Sector plays a vital role in providing household nutritional security, increased income, and employment especially of women and in rural transformation. Animals provide a diverse range of output for cultivation, irrigation, transport; fibre and leather goods, manure for fertilizer and fuel besides direct production of milk, meat and eggs for human consumption. Livestock provide economic security and social status to the family. Thus, progress in livestock sector is directly related to a more balanced development of rural economy and upliftment of poorer sections of the society.

Conclusion:

Conclude with importance of livestock, its significant contribution to the agricultural GDP.

Introduction:

- India's livestock sector is one of the largest in the world. About 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides livelihood to two-third of rural community.
- It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

Body:

Livestock resources in India: (Source: 19th Livestock Census)

- World's highest livestock owner at about 512.05 million
- First in the total buffalo population in the world – 105.3 million buffaloes
- Second in the population of cattle and goats – 140.5 million goats
- Second largest poultry market in the world – production of 63 billion eggs and 649 million poultry meat.
- Third in the population of sheep (72 millions)
- Fifth in the population of ducks and chicken
- Tenth in camel population in the world.

Role of livestock in farmers' economy

The livestock plays an important role in the economy of farmers. The farmers in India maintain mixed farming system i.e. a combination of crop and livestock where the output of one enterprise becomes the input of another enterprise thereby realize the resource efficiency. The livestock serve the farmers in different ways.

- **Income:** Livestock is a source of subsidiary income for many families in India especially the resource poor who maintain few heads of animals. Cows and buffaloes if in milk will provide regular income to the livestock farmers through sale of milk. Animals like sheep and goat serve as sources of income during emergencies to meet exigencies like marriages, treatment of sick persons, children education, repair of houses etc. The animals also serve as moving banks and assets which provide economic security to the owners.
- **Employment:** A large number of people in India being less literate and unskilled depend upon agriculture for their livelihoods. But agriculture being seasonal in nature could provide employment for a maximum of 180 days in a year. The land less and less land people depend upon livestock for utilizing their labour during lean agricultural season.
- **Food:** The livestock products such as milk, meat and eggs are an important source of animal protein to the members of the livestock owners. The per capita availability of milk is around 355 g / day; eggs is 69 / annum;
- **Social security:** The animals offer social security to the owners in terms of their status in the society. The families especially the landless which own animals are better placed than those who do not. Gifting of animals during marriages is a very common phenomenon in different parts of the country. Rearing of animals is a part of the Indian culture. Animals are used for various socio religious functions. Cows for house warming ceremonies; rams, bucks and chicken for sacrifice during festive seasons; Bulls and Cows are worshipped during various religious functions. Many owners develop attachment to their animals.
- **Gender equity:** Animal husbandry promotes gender equity. More than three-fourth of the labour demand in livestock production is met by women. The share of women employment in livestock sector is around 90% in Punjab and Haryana where dairying is a prominent activity and animals are stall-fed.
- **Draft:** The bullocks are the back bone of Indian agriculture. The farmers especially the marginal and small depend upon bullocks for ploughing, carting and transport of both inputs and outputs.
- **Dung:** In rural areas dung is used for several purposes which include fuel (dung cakes), fertilizer (farm yard manure), and plastering material (poor man's cement).

Challenges faced by Livestock sector in India:

- **Productivity:**
 - Improving productivity of farm animals is one of the major challenges. The average annual milk yield of Indian cattle is 1172 kg which is only about 50% of the global average.
- **Diseases:**
 - The Frequent outbreaks of diseases like Food and Mouth Diseases, Black Quarter infection, Influenza etc. continue to affect Livestock health and lower the productivity.
- **Environment:**
 - India's huge population of ruminants contributes to greenhouse gases emission adding to global warming. Reducing greenhouse gases through mitigation and adaptation strategies will be a major challenge.
- **Crossbreeding of indigenous species** with exotic stocks to enhance genetic potential of different species has been successful only to a limited extent.
- **Limited Artificial Insemination services** owing to a deficiency in quality germplasm, infrastructure and technical manpower coupled with poor conception rate following artificial insemination have been the major impediments.
- Livestock sector did not receive the policy and financial attention it deserved. The sector received only about 12% of the total public expenditure on agriculture and allied sectors, which is disproportionately lesser than its contribution to agricultural GDP.
- The sector has been neglected by the financial institutions.
 - The share of livestock in the total agricultural credit has hardly ever exceeded 4% in the total (short-term, medium-term and long-term). The institutional mechanisms to protect animals against risk are not strong enough.
- **Insurance:**
 - Currently, only 6% of the animal heads (excluding poultry) are provided insurance cover. Livestock extension has remained grossly neglected in the past.

- Only about 5% of the farm households in India access information on livestock technology. These indicate an apathetic outreach of the financial and information delivery systems.
- Livestock derives a major part of their energy requirement from agricultural by-products and residues. Hardly 5% of the cropped area is utilized to grow fodder. India is deficit in dry fodder by 11%, green fodder by 35% and concentrates feed by 28%. The common grazing lands too have been deteriorating quantitatively and qualitatively.
- **Lack of access to markets** may act as a disincentive to farmers to adopt improved technologies and quality inputs.
- Except for poultry products and to some extent for milk, markets for livestock and livestock products are underdeveloped, irregular, uncertain and lack transparency. Further, these are often dominated by informal market intermediaries who exploit the producers.
- Likewise, **slaughtering facilities are too inadequate**. About half of the total meat production comes from un-registered, make-shift slaughterhouses. Marketing and transaction costs of livestock products are high taking 15-20% of the sale price.

Way forward

- A national breeding policy is needed to upgrade the best performing indigenous breeds.
- Buffalo breeding ought to be given more attention, while poultry breeding should be focused on conservation.
- State governments should be encouraged to participate in national breeding policy implementation. Geographical information system-based analysis must be utilised to map production systems.
- Animal health care should become a priority, with greater investment in preventive health care.
- Private investment must also be encouraged. The government needs to create better incentive structures for investment in livestock.
- State governments should sponsor research and assessment of the market, along with highlighting investment potential.

Conclusion:

- With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario. Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society.
- Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

Q) Discuss the importance of Public Distribution System in India and also explain the challenges involved and what reforms are required to overcome these challenges. (250 words)

Reference

Why this question:

The question is about PDS – its importance, challenges and reforms required.

Key demand of the question:

The answer must discuss the significance of the PDS system for India and the challenges facing the system and suggest necessary reforms.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments

Structure of the answer:

Introduction:

Define what you understand by PDS.

Body:

Explain that the Public Distribution System (PDS) evolved as a system for distribution of food grains at affordable prices and management of emergency situations. Over the years, the term PDS has become synonymous with the term 'food security' and also an important part of Government's policy for management of food economy in the country.

Then move on to explain the growing significance of PDS, why is it so important with the aspect of food security.

Discuss the challenges associated and suggest what measures/reforms can be taken to make the PDS a success.

Conclusion:

Conclude by reasserting the need to have a robust PDS in place to ensure food secure and healthy India.

Introduction:

- The **Public Distribution System (PDS)** is an Indian food security system which evolved as a system for distribution of food grains at affordable prices and management of emergency situations.
- It distributes subsidized food and non-food items to India's poor. This scheme was launched in June 1947. It functions through a network of Fair Price Shops at a subsidized price on a recurring basis.

Body:

Importance of PDS:

- Food grains to the poor, at prices lower than the price of food grains at private shops.
- Food grains are directly purchased from farmers, assuring farmers with a greater price.
- Make goods available to consumers, especially the disadvantaged /vulnerable sections of society at fair prices.
- Rectify the existing imbalances between the supply and demand for consumer goods. Check and prevent hoarding and black marketing in essential commodities.
- Ensure social justice in distribution of basic necessities of life.
- Even out fluctuations in prices and availability of mass consumption goods.
- Support poverty-alleviation programmes, particularly, rural employment programmes, (SGRY/SGSY/IRDP/ Mid-day meals, ICDS, DWCRA, SHGs and Food for Work and educational feeding programmes.

Challenges faced by PDS:

Procurement:

- Open-ended Procurement: All incoming grains accepted even if buffer stock is filled creating a shortage in the open market.
- The recent implementation of Nation food security act would only increase the quantum of procurement resulting in higher prices for grains.
- The gap between required and existing storage capacity.
- The provision of minimum support price has encouraged farmers to divert land from production of coarse grains that are consumed by poor, to rice and wheat.

Storage:

- Inadequate storage capacity with FCI.
- Food grains rotting or damaging on the CAP or Cover & Plinth storage.
- The storage of foodgrains inculcates high carrying costs on the government.

Allocation of food grains:

- Identification of poor by the states is not fool proof. A large number of poor and needy persons are left out and a lot of fake cards are also issued.
- Illicit Fair Price shops: The shop owners have created a large number of bogus cards or ghost cards(cards for nonexistent people) to sell food grains in the open market.

Transportation:

- Leakage and diversion of food grains during transportation.
- Uneven distribution of Food generations, procurement and distribution. For example: north eastern states are very far from Punjab and Haryana, from where wheat is procured. To transport food grains from Punjab to far flung areas in North east will entail cost and time both.

Other issues:

- Many times, good quality food grains are replaced with poor quality cheap food grains.
- Public distribution system includes only few food grains such as wheat and rice, it does not fulfil the requirement of complete nutrition.
- Fair Price Shop owner gets fake Ration cards and sell the food grains in the open market.

PDS Reforms undertaken by Government:

- **Aadhaar Linked and digitized ration cards:** This allows online entry and verification of beneficiary data. It also enables online tracking of monthly entitlements and off-take of foodgrains by beneficiaries.

- **Computerized Fair Price Shops:** FPS automated by installing 'Point of Sale' device to swap the ration card. It authenticates the beneficiaries and records the quantity of subsidized grains given to a family.
- **DBT:** Under the Direct Benefit Transfer scheme, cash is transferred to the beneficiaries' account in lieu of foodgrains subsidy component. They will be free to buy food grains from anywhere in the market. For taking up this model, pre-requisites for the States/UTs would be to complete digitization of beneficiary data and seed Aadhaar and bank account details of beneficiaries. It is estimated that cash transfers alone could save the exchequer Rs.30,000 crore every year.
- **Use of GPS technology:** Use of Global Positioning System (GPS) technology to track the movement of trucks carrying foodgrains from state depots to FPS which can help to prevent diversion.
- **SMS-based monitoring:** Allows monitoring by citizens so they can register their mobile numbers and send/receive SMS alerts during dispatch and arrival of TPDS commodities
- **Use of web-based citizens' portal:** Public Grievance Redressal Machineries, such as a toll-free number for call centers to register complaints or suggestions.

Way forward:

- Primacy should be given to ensuring that the functioning of FCI is streamlined and fast paced as per recommendations of the Shanta Kumar Committee.
- 100 lakh ton silo storage capacity must be created in the country. For this, RITES has been assigned the task of changing the silo model and they will give their recommendations in 90 days to FCI.
- At present, there are 3 types of labourers in FCI namely Departmental, Daily Payment System (DPS) and No work no pay workers along with contractual labour. Government of India is deliberating to finish the 3 different arrangements and bring all workers of FCI under a single, uniform system which will bring stability of tenure and secured wages for all.
- To improve the usage of Information Technology in FCI, a Human Resource Management System (HRMS) must be implemented.

Conclusion:

- PDS has helped bring about the socio-economic justice by helping alleviate hunger, malnutrition, anaemia among poorest of the poor, BPL citizens, women and children. The use of ICT to reduce the touch-points will further increase the efficiency of PDS.

Q) Discuss the effects of livestock farming on environment. (250 words)

Indian Geography by Majid Hussain

Why this question:

The question is direct and is about discussing the effects of livestock farming on environment.

Key demand of the question:

The answer must discuss the pros and cons of livestock farming on the environment.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments

Structure of the answer:

Introduction:

Describe basics of livestock farming.

Body:

Explain in detail the equation between livestock farming and global warming

The conversion of forests into agricultural land and livestock ranches is one of the major causes of deforestation. It is being done to meet the rising demand for food. One to two acres of rainforests are cleared every second for animal rearing and agriculture. Another major concern is greenhouse gas emissions. Raising livestock generates 14.5 per cent of global greenhouse gas emissions that are very bad for the environment. Forests help lower the risks of sudden climate change and also tone down the impacts from natural disasters.

Discuss both pros and cons and conclude with what needs to be done to overcome the challenge.

Conclusion:

Suggest how the impact can be mitigated or reduces what can be other alternatives.

**Introduction:**

- Livestock is used for meat, dairy products, eggs, fibre and leather, transport, and for manure to fertilize crops and for fuel. According to FAO 2006, the livestock sector accounts for 40 % of the world's agriculture-related gross domestic product (GDP).
- It employs 1.3 billion people and provides livelihoods for around 1 billion of the world's population living in poverty. However, it is also a major driver of climate change through the emissions of greenhouse gases such as carbon dioxide, CH₄, and nitrous oxide.

Body:**Effects of livestock farming on environment:**

- Globally, the livestock sector contributes 14.5 % (7.1 billion tonnes CO₂equivalent) of global anthropogenic greenhouse gas emissions. (FAO)
- Cattle are responsible for the most emissions, representing about 65% of the livestock sector's emissions.
- In terms of activities, feed production and processing (45%) and enteric fermentation from ruminants (39%) are the two main sources of emissions
- About 44% of livestock emissions are in the form of methane (CH₄). Nitrous Oxide accounts for 29% and Carbon Dioxide 27%
- About 92 per cent of the fresh water is used for farming purposes, and 1/3rd of it is used for rearing livestock and manufacturing animal products.
- Ruminants such as cattle, sheep, buffalo, and goats produce methane, potent greenhouse gas that can contribute to global climate change, as part of their digestive process.
- Globally, ruminant livestock produce about 86 million metric tons of CH₄ annually.
- Animal manure produces anthropogenic CH₄ via anaerobic decomposition of manure and N₂O via nitrification and denitrification of organic nitrogen in animal manure and urine.
- Livestock operations require a variety of external inputs (i.e., feed production, herbicides, pesticides, etc.). Carbon dioxide emissions originate from the expansion of feed crops and pasture into natural habitats.
- They also originate from the use of fossil fuel to manufacture fertilizer, and process and transport feed.
- The livestock sector includes direct and indirect (e.g. electricity) on-farm fossil fuel use, which is used for machinery operations, irrigation, heating, cooling, ventilation etc.
- Land-use changes, including expansion of pasture and arable land for feed crops generally occur at the expense of forested land.
- It is estimated that livestock-related land-use change produces 35 % of the total GHGs attributed to livestock.
- Post farm CO₂ emissions is related to the processing and transportation of livestock product between the production and retail point
- Overgrazing by livestock is one of the most important cause of land degradation and desertification. Such problem is prominent in Africa, Central Asia, north-eastern Australia, Pakistan, and Afghanistan.

Measures needed:

- **Improving Feed Quality and Digestibility:** measures should be taken for better grassland management, improved pasture species, changing forage mix and greater use of feed supplements.
- **Improving animal health and husbandry:** It is important to improve animal health through measures such as animal health management, extending the productive life of animals, and improving reproduction rates to reduce the number of animals kept otherwise rather than production.
- **Agroforestry:** Agroforestry should be practiced to help maintain the balance between livestock production, environmental protection and carbon sequestration to offset emissions from the sector.
- **Manure management:** It is important to adopt sound manure management to mitigate GHG emissions, reduce nutrient losses from livestock production systems and reduce other detrimental environmental impacts of livestock production such as air and water pollution
- **Grassland management:** It is important to improve grazing and grassland management to increase feed quality and carbon sequestration. Further, overgrazing should be halted to combat land degradation and desertification.
- **Awareness:** Raising awareness about impact of livestock/meat consumption on climate is important.
- **Policy:** Countries should develop sectoral mitigation policies that integrate other development objectives, and seek international support towards their implementation.

**Conclusion:**

- Livestock farming creates a huge carbon footprint and has a very high global warming potential. However, its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society.
- Thus, the need of the hour is a green, sustainable way of livestock farming which balances the needs of people and environmental conservation.

Q) Though Economic contribution of livestock is today more than that of food grain crops, absence of policy focus has stifled the sector that caters to the poorest. India's livestock productivity is 20-60 per cent lower than the global average. Discuss the challenges and concerns associated with the growth of this sector and suggest what needs to be done. (250 words)

Reference**Why this question:**

The question is based on the theme of Livestock sector of the country and the challenges and concerns associated with it.

Key demand of the question:

The answer must discuss in detail the challenges and concerns associated with the growth of livestock sector in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Describe the current status of livestock sector in India. Quote relevant facts/statistics depicting the contribution of livestock to the agricultural GDP.

Body:

The answer must discuss the following aspects:

First highlight the contribution of the sector to the agriculture sector of the country.

Then discuss specific challenges associated with the sector – Inadequate availability of credit, Poor accesses to organized markets deprive farmers of proper milk price, Limited availability of quality breeding bulls, Deficiency of vaccines and vaccination set-up, Due to industrialization and Urbanization Majority of grazing lands are either degraded or encroached, Diversion of feed and fodder ingredients for industrial use.

Conclusion:

Conclude with way forward by suggesting measures to overcome the above mentioned challenges.

Introduction:

- India's livestock sector is one of the largest in the world. About 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households.
- Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

Body:**Livestock resources in India:** (Source: 19th Livestock Census)

- World's highest livestock owner at about 512.05 million
- First in the total buffalo population in the world – 105.3 million buffaloes
- Second in the population of cattle and goats – 140.5 million goats
- Second largest poultry market in the world – production of 63 billion eggs and 649 million poultry meat.
- Third in the population of sheep (72 millions)
- Fifth in the population of ducks and chicken
- Tenth in camel population in the world.

Challenges faced by Livestock sector in India:

- Livestock sector did not receive the policy and financial attention it deserved. The sector received only about 12% of the total public expenditure on agriculture and allied sectors, which is disproportionately lesser than its contribution to agricultural GDP.
- The sector has been neglected by the financial institutions.
 - The share of livestock in the total agricultural credit has hardly ever exceeded 4% in the total (short-term, medium-term and long-term). The institutional mechanisms to protect animals against risk are not strong enough.
- **Insurance:**
 - Currently, only 6% of the animal heads (excluding poultry) are provided insurance cover. Livestock extension has remained grossly neglected in the past.
 - Only about 5% of the farm households in India access information on livestock technology. These indicate an apathetic outreach of the financial and information delivery systems.
- **Lack of access to markets** may act as a disincentive to farmers to adopt improved technologies and quality inputs.
- **Productivity:**
 - Improving productivity of farm animals is one of the major challenges. The average annual milk yield of Indian cattle is 1172 kg which is only about 50% of the global average.
- **Diseases:**
 - The Frequent outbreaks of diseases like Food and Mouth Diseases, Black Quarter infection, Influenza etc. continue to affect Livestock health and lower the productivity.
- **Environment:**
 - India's huge population of ruminants contributes to greenhouse gases emission adding to global warming. Reducing greenhouse gases through mitigation and adaptation strategies will be a major challenge.
- **Crossbreeding of indigenous species** with exotic stocks to enhance genetic potential of different species has been successful only to a limited extent.
- **Limited Artificial Insemination services** owing to a deficiency in quality germplasm, infrastructure and technical manpower coupled with poor conception rate following artificial insemination have been the major impediments.
- Livestock derives a major part of their energy requirement from agricultural by-products and residues. Hardly 5% of the cropped area is utilized to grow fodder. India is deficit in dry fodder by 11%, green fodder by 35% and concentrates feed by 28%. The common grazing lands too have been deteriorating quantitatively and qualitatively.
- Except for poultry products and to some extent for milk, markets for livestock and livestock products are underdeveloped, irregular, uncertain and lack transparency. Further, these are often dominated by informal market intermediaries who exploit the producers.
- Likewise, **slaughtering facilities are too inadequate**. About half of the total meat production comes from un-registered, make-shift slaughterhouses. Marketing and transaction costs of livestock products are high taking 15-20% of the sale price.

Measures needed:

- A national breeding policy is needed to upgrade the best performing indigenous breeds.
- Buffalo breeding ought to be given more attention, while poultry breeding should be focused on conservation.
- State governments should be encouraged to participate in national breeding policy implementation. Geographical information system-based analysis must be utilised to map production systems.
- Animal health care should become a priority, with greater investment in preventive health care.
- Private investment must also be encouraged. The government needs to create better incentive structures for investment in livestock.
- State governments should sponsor research and assessment of the market, along with highlighting investment potential.

Conclusion:

- With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario.

- Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society.
- Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

Q) Subsidies are often criticised that instead of offering solutions to the problems they themselves become a problem. In the light of the above statement discuss the issues surrounding the subsidy system in India. (250 words)

[Timesofindia](https://www.timesofindia.com)

Why this question:

The question is based on the theme of Subsidies.

Key demand of the question:

The answer must evaluate in what way subsidies often fail to achieve their actual intent and end up becoming a problem in themselves.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief on what you understand by subsidies.

Body:

Discussion should include the following:

Paint a picture of the history of subsidies as a concept that evolved in India since independence and that the basic objective of the public distribution system in India is to provide essential consumer goods at cheap and subsidized prices to the consumers so as to insulate them from the impact of rising prices of these commodities and maintain the minimum nutritional status of our population.

Explain the associated challenges, advantages and disadvantages.

Discuss in detail the problems of public distribution system in India.

Conclusion:

Conclude with way can be done to overcome the issue and make the concept work .

Introduction:

- A subsidy, often viewed as the converse of a tax, is an instrument of fiscal policy. It literally implies coming to assistance from behind. However, their beneficial potential is at its best when they are transparent, well targeted, and suitably designed for practical implementation.
- Subsidies are helpful for both economy and people as well. Subsidies have a long-term impact on the economy; the Green Revolution being one example.

Body:

A welfare state without subsidies cannot be imagined. Governments have to extend subsidies to achieve objectives of socio- economic policy. By this, they aim at

- Making basic necessities affordable to poor people through extension of consumer services.
- To prepare a foundation of various economic sectors in which private sector can participate later. When economy is at lower stages of development, it is often unviable and unaffordable for private sector to step in production. This is mainly because there are limited resources with private investors and there are informational externalities/uncertainties.
- In such case government do handholding by supporting private sector by extending subsidies and withdrawing them when private sector becomes competitive.

Subsidies should be aimed at specific development objectives. On achievement of these objectives subsidies should be phased out. It is only then that subsidies can go well with an undistorted market economy.

Issues surrounding the subsidy system in India:

- **Misuse of subsidies:** The subsidies that are provided by the government seldom reach the small farmers. They are mostly snatched by the large farmers or the manufacturers.

- **Distortion of trade:** Input subsidies distort trade by increasing net exports of input intensive commodities while decreasing net exports of commodities which require relatively few inputs. Many countries like Australia, US and UK have challenged the subsidies on wheat, sugarcane etc. which they claim are distorting trade.
- **Increased financial burden:** The expenditure on subsidies has doubled in the last decade leading to widening fiscal deficit of the country. It is driven primarily by subsidies in fertilizer and electricity. Most of the expenditure made on subsidies goes into the wrong hands and thus perpetuates their requirement as the position of farmers does not improve.
- **Uneven distribution:** Unevenness is rife across regions, crops and differing farm sizes. For example-it is alleged that subsidies have benefitted more to the north Indian states as compared to south and north eastern states.
- **Flawed policies:** Hostile policies have compounded the problems as no major fertilizer plants have come up in the last many years. A huge fraction of urea requirements is still met with imports.

Instances of misuse of subsidies:

- In case of food subsidy, PDS suffers from considerable leakage and apart from a low coverage of poor; the magnitude of benefit derived by the poor is very small.
- In case of electricity, the subsidy rates have been rising for both agriculture and domestic sectors because the unit cost has been rising faster than the relevant tariff-rate. Also, there is considerable variation in the level of per capita electricity subsidy indicates that, in the richer States, the per capita subsidy is substantially higher as compared to that in the poorer States.
- In case of public irrigation, water has a very high marginal productivity when used in conjunction with HYV of seeds, chemical fertilisers, power and other related inputs. It is the richer farmers who may derive relatively larger benefits because of their capacity to use these allied inputs.
- Subsidies to elementary education form about half of the total subsidies on general education. However, this is not true for all individual States: the share of elementary education is lowest in the high income States and the highest in the low income States (Goa, Punjab and West Bengal actually give higher subsidies to secondary education than primary education). A negative correlation between the level of per capita income and the share of subsidies to elementary education is thus discernible. Most subsidies to higher education accrue predominantly to the better-off sections of society as they have an overwhelming advantage in competing out prospective candidates from the poorer sections in getting admission to courses that are characterised by scarcity of seats.
- For subsidies of health, the greater emphasis on curative health care expenditure often reflects a bias towards the better-off people whereas preventive health care expenditure with much larger externalities would clearly be of greater help to the economically weaker sections of the society.

Way forward:

- Reducing the overall scale of subsidies
- Making subsidies as transparent as possible using JAM trinity
- Using subsidies for well defined economic objectives
- Focusing subsidies to final goods and services with a view to maximising their impact on the target population at minimum cost
- Instituting systems for periodic review of subsidies
- Use of technology like Direct Benefit Transfer to the beneficiaries' bank account, Aadhar Enable Payment System etc.

Conclusion:

- Subsidies are meant for poor people and they shall ensure equitable redistribution of resource. Subsidies extended to rich are regressive. They help in keeping poverty intact and create inefficiencies in economy which culminates in inflation and corruption.
- Rationalization of subsidy regime will improve markets in India which will then attract more investment. This in short, can turn the wheel of a virtuous economy which creates more employment and attacks poverty at its roots.

Q) What is Public Distribution System (PDS)? discuss its basic objective in India and explain how has coming of Aadhaar changed the functionality of PDS. (250 words)

Reference

Why this question:

The question is to evaluate What is public distribution system what is its importance and in what way the Aadhaar has changed the mode of functionality of the PDS.

Key demand of the question:

The answer must discuss in detail the concept of PDS, effects of Aadhar on the modalities of its working and how over a period of time it has only gotten better and that there is still scope for improvement.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short explain what is meant by public distribution system.

Body:

The answer should have the following dimensions covered:

What is meant by public distribution system?

What are the drawbacks of public distribution system?

What is the basic objective of public distribution system in India?

How has Aadhaar changed the mode of working of the system – pros and cons.

What are the advantages, challenges etc.

Conclusion:

Conclude with way forward.

Introduction:

- The **Public Distribution System (PDS)** is an Indian food security system which evolved as a system for distribution of food grains at affordable prices and management of emergency situations. It distributes subsidized food and non-food items to India's poor.
- This scheme was launched in June 1947. It functions through a network of Fair Price Shops at a subsidized price on a recurring basis.

Body:

The objectives of the Public Distribution System are as follows:

- To protect the low income groups by guaranteeing the supply of certain minimum quantities of food grains at affordable price.
- Ensuring equitable distribution.
- Controlling the price rise of Essential Commodities in the open market.

Aadhar and functionality of PDS:

- **Aadhaar as an identifier:**
 - People belonging to marginalized sections of the society often do not have a valid proof of identity. As a result, they miss out on availing social benefits provided by the government. Aadhaar has been successful in solving this problem.
 - One of the quintessential properties of Aadhaar is its uniqueness. It is an identification that a person can carry for a life time and potentially use with any service provider thus, fundamentally becoming a pro-poor identification infrastructure.
- It provides a single view of beneficiary data and information, aiding in streamlining policy decisions for the state
- **Social benefits delivery services:**
 - Enables State Governments to directly transfer benefits to beneficiary accounts under various schemes.
- **Beneficiary Identification:**
 - Helps in sanitizing the State's/Department's databases and uniquely identifying beneficiaries by removing ghost/duplicate identities
- **Demographic and development planning:**
 - Enables valuable anonymized demographic data to help development planning at State, District and local government levels.
- **Preventing leakages:**
 - Welfare programs, where beneficiaries need to be confirmed before service delivery, also stand to benefit from UIDAI's verification service.
 - Examples of such usages include subsidized food and kerosene delivery to Public Distribution System (PDS) beneficiaries.

- This usage would ensure that services are delivered to the right beneficiaries only.

However, the use of Aadhaar-based biometric authentication (ABBA) in the public distribution system has its own share of challenges:

- ABBA requires not only Aadhaar seeding, but also successful fingerprint authentication at the ration shop every month. That, in turn, requires a functional Point of Sale (PoS) machine, adequate connectivity, and reasonably smooth fingers. Despite some alleged safeguards, the system is far from perfect
- Evidence from Jharkhand suggests that ABBA is of little use in reducing PDS corruption.
- Neither seeding nor the ABBA can stop quantity fraud.
- If PDS dealers give people less than their due, biometric authentication does not help.
- Cases of deaths due to hunger as people could not collect rations because of a biometric mismatch at the PDS shop.
- Disenfranchisement of the elderly and the disabled, as ABBA requires beneficiaries to visit the PDS outlet personally for fingerprint authentication.
- **Seeding issues:**
 - When benefits are paid through Aadhaar-enabled means such as the Aadhaar Payments Bridge System (APBS), the first step is to seed the list of beneficiaries with the corresponding Aadhaar numbers. Seeding is a tedious operation and it has to be done each time a new scheme is inducted. Those who have failed to comply are simply removed from the lists
 - Seeding often creates inconsistencies between ration-cards database and the Aadhaar database.
 - Many poor people do not know the rules of Aadhaar seeding and biometric authentication.
- **Inclusion errors** increase the financial burden of the state, exclusion errors can often leave poor families vulnerable to hunger.
- **Deprivation of poor:**
 - Poor people often find themselves deprived of their rights in the process. For instance linking one's pension or ration card or bank account with Aadhaar is a tedious process as data-entry errors are common.
 - And even without such errors, Aadhaar linking often fails because a person's demographic details in the Aadhaar database do not match the corresponding details in her job card or ration card.
 - The government failed to address these issues as job cards, ration cards and pensions have been mass-cancelled in many states

Way forward:

- Inconsistencies need to be resolved for successful Aadhaar seeding.
- It is essential to deal with issues of duplication, use less disruptive methods than Aadhaar such as food coupons, smart cards, and last-mile tracking
- Using other technology to curb corruption like computerisation, SMS alerts, online availability of official records, toll-free help lines and so on.
- It is imperative that the Union Government enact a privacy legislation that clearly defines the rights of citizens consistent with the promise of the Constitution.
- The government should factor in privacy risks and include procedures and systems to protect citizen information in any system of data collection. It should create institutional mechanism such as Privacy Commissioner to prevent unauthorised disclosure of or access to such data.
- Our national cyber cell should be made well capable of dealing with any cyber attack in shortest time.

Conclusion:

- PDS has helped bring about the socio-economic justice by helping alleviate hunger, malnutrition, anaemia among poorest of the poor, BPL citizens, women and children. The use of ICT to reduce the touch-points will further increase the efficiency of PDS.

Topic: Infrastructure: Energy, Ports, Roads, Airports, Railways etc., Investment Models.

Q) The global automobile industry is striding forward to move away from fossil fuels. Do you think India become a world leader in electric vehicles industry? Critically analyse the issues and challenges in front of Indian automobile industry to shift to electric vehicles. (250 words)

The hindu

**Why this question:**

To push the adoption of electric mobility in the country, government think-tank NITI Aayog has proposed the establishment of giga factories in India for the manufacture of lithium-ion batteries in the next couple of years.

Key demand of the question:

The answer must evaluate the current automobile industry scenario in India and the challenges before it in shifting to the electric mobility generation technology.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:**Introduction:**

In short explain the current automobile industry scenario in India.

Body:

The answer must analyse the global trends of electric mobility, its importance, then explain what are the issues or challenges for Indian automobile industry to move away from current fossil fuel based system to electric mobility system. One has to discuss in detail the bottlenecks and suggest way forward as to what needs to be done and how far can India achieve in this direction.

Conclusion:

One can conclude with government’s efforts in this direction.

Introduction:

- Electric vehicles (EVs) are automobiles that run on electricity only. They are propelled by one or more electric motors powered by rechargeable battery packs. Electric vehicles are cleaner than petroleum-fuelled vehicles and are seen as a promising solution to global warming.
- To push the adoption of electric mobility in the country, government think-tank NITI Aayog has proposed the establishment of giga factories in India for the manufacture of lithium-ion batteries in the next couple of years.

Body:

- India definitely has the potential to be a global leader in EVs and the government is making strong push in favour of the electric vehicles or the e-vehicles. Government is also encouraging or sometimes even forcing auto industry to shift towards the e-vehicles. While e-vehicles have their benefits over normal vehicles, the topic of e-mobility seems to be missing from the agenda of the government.
- E-vehicles reduce the localized pollution and are important in the cities like Delhi, Pune, Lucknow etc. Such vehicles would also reduce the dependence on the petroleum, import of which has adverse effect on Indian economy. E-vehicles are also instrumental in reducing the emission of green-house gases and many health hazards

Issues and challenges involved:

- **Price Volatility:**
 - The first has to do with policy volatility. E-mobility is a nascent industry in India and most of the developing countries. Capital costs are high and the payoff is uncertain.
 - Inconsistencies remain. For instance, while electric vehicles are taxed at 12% under the goods and services tax (GST), batteries were taxed at 28% until recently. This has now been lowered to 18% but the discrepancy still exists.
- **Lack of policy certainty: Cannot frame in Isolation:**
 - The lack of policy certainty spills over into perhaps the single most important element of enabling e-vehicle usage: charging infrastructure.
 - Lack of attention on building charging infrastructure.
- **Local and Private Investment results in Low Cost production Technology:**
 - Localization is another tricky area, as the strife caused by the rupee’s depreciation has shown.
 - India does not have any known reserves of lithium and cobalt, which makes it entirely dependent on imports of lithium-ion batteries from Japan and China.
- **Short Driving Range and Speed**
 - Most of these cars have range about 50-100 miles and need to be recharged again.

- **Battery Recharge Issues**
 - An electric car takes about 4-6 hours to get fully charged. Therefore there is a need for dedicated power stations as the time taken to recharge them is quite long.
- **Silence as Disadvantage**
 - Silence can be a bit disadvantage as people like to hear noise if they are coming from behind them
 - An electric car is however silent and can lead to accidents in some cases.
- **Limited seating capacity**
 - They are not meant for entire family and a third person can make journey for other two passengers bit uncomfortable.
- **Not Suitable for Cities Facing Shortage of Power**
 - Cities already facing acute power shortage are not suitable for electric cars.
 - The consumption of more power would hamper their daily power needs.
- **High cost**
 - The primary reason for the current high prices of EVs is the expensive battery

Way forward:

- For EVs to contribute effectively, we need commensurate efforts in developing an entire ecosystem.
- Need to shift the focus from subsidizing vehicles to subsidizing batteries because batteries make up 50% of EV costs.
- Increasing focus on incentivizing electric two-wheelers because two-wheelers account for 76% of the vehicles in the country and consume most of the fuel.
- A wide network of charging stations is imminent for attracting investment.
- Work places in tech parks, Public bus depots, and Multiplexes are the potential places where charging points could be installed. In Bangalore, some malls have charging points in parking
- Corporates could invest in charging stations as Corporate Social Responsibility compliances.
- Addressing technical concerns like AC versus DC charging stations, handling of peak demand, grid stability etc.
- Private investment in battery manufacturing plants and developing low cost production technology is needed.
- India is highly dependent on thermal sources, which account for about 65% of current capacity. As EV adoption increases, so should the contribution of renewables.
- Need for a policy roadmap on electric vehicles so that investments can be planned.
- Acquiring lithium fields in Bolivia, Australia, and Chile could become as important as buying oil fields as India needs raw material to make batteries for electric vehicles.
- Providing waiver of road tax and registration fees, GST refunds and free parking spaces for EVs.

Conclusion:

- Environment-friendly EVs will reduce air pollution and thus contribute to the fight against climate change. As per **NITI Aayog's report** EVs will help in cutting down as much as 1 Gigatonne (GT) of carbon emissions by 2030. The government should have a role.
- Instead of trying to pick winners, the government should focus on building an enabling business environment that supports research and innovation.

Q) Discuss the prospects for ports in India. What are the issues and challenges with Indian Ports ? Examine. (250 words)

Indian geography by Majid Hussain

Why this question:

The question is based on the policy perspective with respect to the investments in the defense sector and in what way FDI brings in self-reliance and Indigenization.

Key demand of the question:

The answer must discuss the importance of FDI in defense, trace its evolution And analyse in detail its implications.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Discuss first the importance of investments in defense sector in general.

**Body:**

The body of the answer to have the following aspects covered in detail :

Explain the evolution of FDI in Defence Sector.

Then discuss the associated advantages (Transparency, Quality Products, Reduction of Reserves, Positive Performance Pressure on Public Sector Enterprises, Employment Opportunities etc.) and disadvantages (Security Concerns, Competition for Domestic Private Industry, Overbearing Presence of Foreign Companies etc.)

Then focus on to explaining the Implications of FDI in Defense on Self-Reliance and Indigenization.

Conclusion:

Conclude with way forward.

Introduction:

- India by virtue of being a peninsular country with a long coastline has the natural advantage of developing ports. There are 13 major ports in the country; 6 on the Eastern coast and 6 on the Western coast. Further there are about 200 non-major ports.
- The 12 major ports in the country have a combined total capacity of 1,065 million metric tonnes (MMT), while the capacity at non-major ports is roughly 700MMT. Currently 95% of India's trade by value and 70 % by volume take place through maritime transport.

Body:**Major Ports of India:****Issues and challenges with Indian Ports:**

- High turnaround times:** Ports in India suffer from high turnaround times for ships. For example, in Singapore, average ship turnaround time is less than a day. However, in India, it is over two days.
- Port congestion:** Port congestion due to container volume, shortage of handling equipment and inefficient operations is a major concern. Example: In Nhava Sheva port
- Sub-optimal Transport Modal Mix:** Lack of requisite infrastructure for evacuation from major and non-major ports leads to sub-optimal transport modal mix
- Limited Hinterland Linkages:** There is inefficiency due to poor hinterland connectivity through rail, road, highways, coastal shipping and inland waterways. This in turn increases the cost of transportation and cargo movement
- Lengthy inspection and scrutiny:** Though customs operations in India are rapidly going paperless and converting to digital, inspections and scrutiny continue to be lengthy for cargo and other shipping operations.
- Inadequate infrastructure and Technology Issues:**
 - Lack of adequate berthing facility, number of berths, sufficient length for proper berthing of the vessels at the Non-Major Ports is another problem.
 - Most Non-Major Ports do not have proper material handling equipment in place which could facilitate a quick turnaround
 - Most Indian ports lack of equipment for handling large volume
 - Further many ports also lack adequate navigational aids, facilities and IT systems
- Issues with Regulations:**
 - The major problem with regulation is that major and non-major ports fall under different jurisdictions. Further, the regulatory framework is rigid.
 - Foreign-flagged vessels are not allowed to ship cargo from one Indian port to another as that remains a protected turf for domestic shippers
 - Land acquisition and environmental clearances are some specific challenges for non-major ports.
- Issues with PPP Model:**
 - Most port PPPs impose strict limits on what private operators are allowed to do, usually in terms of the types of cargo they are allowed to handle.

- Until recently, Other problems were related to tariff regulation and absence of dispute resolution mechanism
- **Environmental impact:**
 - During the operation of ports, spillage or leakages from the loading and unloading of cargo and pollution from oil spills are common due to poor adherence to environmental laws and standards.
 - The water discharged during the cleaning of a ship and the discharge of ballast water is a threat to marine ecosystems
 - Dredging causes environmental problems (increased sedimentation) affecting local productivity of the local waters and its fisheries.
- **Social impacts of Port Development:**
 - Most port projects and development results in displacement (such as Gangavaram Port in Andhra and Mundra in Gujarat).
 - Besides displacement, the other important concern expressed by fishing communities is the restriction of access to fishing grounds around a port.
- **Manpower and Labour Issues:** Lack of adequate training, falling manpower quality, opposition to reform are major issues
- **Unhealthy Competition:** Analysts have cited the concerns over development of multiple ports in close vicinity handling similar cargo as it might lead to ports competing for the same cargo arrivals.

Measures needed:

- Environmental clearances, Tariff norms, land acquisition etc. need to be standardized and implemented for the port sector so as to boost foreign investments
- It is important to provide rail and road connectivity to major and minor ports in order to ensure seamless multimodal transport and improve efficiency
- Priority should be given on expanding capacity and improving operational efficiency. Emphasis should be placed on installing advanced cargo handling processes, scalability in processes and mechanisation of port operations.
- Technologies like big data and advanced GPS navigation systems should be optimally used for better functioning of ports
- The regulatory regime should be made less complex and less rigid. Further, there should be vertical integration of all stakeholders (for example: environment, rail/road transport etc.) for holistic development of ports in India
- With regards to ports, **Vijay Kelkar committee on PPP** recommended review of role and need of Tariff Authority for Major Ports (TAMP), review of MCA, quicker clearances, rationalized leases and stamp duties
- Port modernisation and new port development, port connectivity enhancement, port-linked industrialisation and coastal community development under the Sagarmala project has an immense scope for reduction in transportation and logistics costs and boosting export competitiveness.
- **Niti Aayog in its Three Year Acton Agenda (2017-2018)**, recommended the following:
 - Increase competition through easing cabotage
 - Increase the capacity of and eliminate discriminatory provisions for Indian vessels
 - Explore creating deep-water ports or barges for ports with low drafts
 - Facilitate minor/non-major port connectivity to hinterland areas

Conclusion:

- Sagarmala project has to be devised to reduce logistics cost and strengthen India's EXIM industry. Thus, in order to achieve higher economic growth and higher efficiency levels, the trade-GDP ratio needs to increase substantially.
- Improvement in the efficiency of ports and expansion of their capacity is essential for promoting the growth of trade and export competitiveness.

Q) Despite proper implementation to providing access to clean cooking fuel, the Ujjwala Yojana seems to have hit a roadblock with respect to affordability. Analyse the issue and provide for an assessment on the feasibility of further expansion of this programme. (250 words)

[Reference](#)

**Why this question:**

The question is about analysing the success of the Ujjwala Yojana.

Key demand of the question:

The answer must discuss in detail the progress made by Ujjwala yojana in achieving access to the cleaner cooking fuel and to what extent it will be right to proceed with the program further.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:**Introduction:**

Begin with brief intro on the program intent – Ujjwala Yojana aims at providing clean cooking fuel to BPL families. The scheme aims at providing access to the under privileged sections of the society.

Body:

Discussion should include the following:

Explain why there are doubts about the question of affordability with respect to the program.

List the various causes like – cost involved, Black marketing, Lack of door delivery of cylinders is also adversely impacting refilling of cylinders in rural areas. Thus, one must detail on the aspects of the logistics hinderances and lack of penetration of the scheme and suggest solutions to overcome the same.

Conclusion:

Conclude that one aspect alone should not decide success or failure and that with suitable corrections and fixes the program can still achieve its mandate.

Introduction:

- Pradhan Mantri Ujjwala Yojana (PMUY) is a scheme of the Ministry of Petroleum & Natural Gas for providing LPG connections to women from **Below Poverty Line (BPL) households**. India is home to more than 24 Crore households out of which about 10 Crore households are still deprived of LPG as cooking fuel and have to rely on firewood, coal, dung – cakes etc. as primary source of cooking.
- The PMUY has helped the spread of LPG cylinders predominantly in the urban and semi-urban areas with the coverage mostly in middle class and affluent households. It aims to safeguard the health of women & children by providing them with a clean cooking fuel – LPG, so that they don't have to compromise their health in smoky kitchens or wander in unsafe areas collecting firewood.

Body:**Achievements:**

- The oil ministry's Petroleum Planning and Analysis Cell (PPAC) estimates that LPG coverage in India (the proportion of households with an LPG connection) has increased from 56% in 2015 to 90% in 2019. There is a significant increase in eastern states, with 48% of the beneficiaries being SC/STs.
- The government reports show that around 80% of the beneficiaries have been refilling cylinders, with average per capita consumption being 3.28 cylinders.
- PMUY has resulted in an additional employment of around 1 Lakh and provide business opportunity of at least Rs. 10,000 Crore in last 3 Years to the Indian Industry.
- The scheme has also provided a boost to the 'Make in India' campaign as all the manufacturers of cylinders, gas stoves, regulators, and gas hose are domestic.
- PMUY reduces these ill-effects by providing clean fuel and cutting out on drudgery. Increased use of cooking gas will shrink the incidence of tuberculosis in India, based on the statistics from the latest National Family Health Survey (NFHS-4) on TB prevalence.
- PMUY has helped in reducing the drudgery for women. The time saved can be used in socio- economically productive activities like **Self-Help Group activities**.
- The **World Health Organisation** hailed PMUY as decisive intervention by the government to facilitate the switch to clean household energy use, thereby addressing the problems associated with Indoor Household Pollution.

However, given the **scale** of the scheme there are some **implementation shortcomings** of the scheme

Cost issues:

- Consumers were paying market price for refills till the loan repayment for stove and first refill was made. This led to some consumers not going in for such refills.

- **Economic Burden:** The **increased monthly expenditure** has shied many consumers away from LPG and lured them back to firewood and cow-dung cakes.
- The **CEEW study** across Uttar Pradesh, Madhya Pradesh, Jharkhand, Bihar, West Bengal and Odisha found people were unwilling to pay upfront Rs.900-1,000 for a 14 kg refill.
- A **CRISIL Study** shows that of those surveyed, 86% said they had not shifted from biomass to LPG because the price of installing a connection was too high. Almost the same number – 83% – said the price of refills was too high.

Administrative issues:

- The government claims that around 80% of the beneficiaries have been refilling cylinders, with average per capita consumption being 3.28 cylinders. But there are implementation issues with the scheme in Madhya Pradesh, for instance.
- Aadhar seeding also faces issues caused by data discrepancies, especially where the spelling of names is concerned as a result of which applicants can find themselves unable to register for the scheme.

Logistic issues:

- Lack of LPG cylinder bottling plants near rural areas and connectivity issues especially in the tribal areas.
- Last-mile connectivity and delivery still poses a great challenge.

Safety and Behavioural issues:

- Safety has been another concern about distribution of LPG connection, especially to BPL families. Lack of awareness and safety amenities in beneficiary households have increased the likelihood of accidents.
- Cow-dung cakes lying around the house all the time. Hence, LPG cylinders are used on special occasions or during some kind of emergency or when it's entirely too hot to burn wood.
- The CRISIL report also noted that 37% of households in rural areas procure cooking fuel for free.
- **Agency:** Most rural women do not have a say in determining when a refill is ordered, even though the connection is in their name.

Way Forward:

- **Increase Affordability:** A case in point is state-run fuel retailers introducing a 5kg refill option to make purchases affordable.
- **Increase Accessibility:** Gas Agencies should be set up within 10km radius, especially in the rural and remote areas to increase accessibility.
- **Increase Availability:** Alternatives like Gas-grid and piped connections in cities and areas near the bottling plants can free up the cylinders for other areas.
- **Promote 'Give it up':** The initiative of the government to persuade the well-off to give up the LPG subsidies has added to the corpus of PMUY. Similar initiatives can be promoted.
- **Encourage Private Players** to set up LPG franchises at rural areas.
- **Sensitization and Education** of safe use of LPG through **LPG Panchayats, NGO's etc.**

Conclusion:

- PMUY is a novel scheme having twin benefits of women empowerment as well as environmental conservation.
- Ironing out the implementation issues can reap the envisioned benefits and lead to a sustainable future in energy consumption.

Q) The issue of paused infrastructure projects in India, is an indicator of market and regulatory failure. Discuss. (250 words)

Reference

Why this question:

The question is pertaining to the hurdles infrastructure in India are facing due to market failures and regulatory failures.

Key demand of the question:

The answer must discuss what are the issues with respect to infrastructure projects in India, what are the causes of such issues and what needs to be done.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief intro on infrastructure projects and their significant contribution in the growth and development of the country.

Body:

Discussion should include the following:

Explain that India has an enormous infrastructure gap, but it can be bridged by cooperation between the public and private sectors.

Discuss the challenges infrastructure projects are facing due to market and regulatory failures like corruption, political and regulatory risk, access to financing and macroeconomic instability.

Suggest what needs to be done to overcome these bottlenecks.

Conclusion:

Conclude with way forward.

Introduction:

- Infrastructure is a key driver of the overall development of Indian economy. It is seen that investments in infrastructure equal to 1% of GDP will result in GDP growth of at least 2% as infrastructure has a “**multiplier effect**” on economic growth across sectors.
- The recent headway made in developing transport infrastructure will prove to be the biggest enabler for growth.

Body:

- The critical role of finance in economic growth is widely acknowledged and developing well-functioning financial markets has become a central focus of economic policies across the world.
- A new World Bank study suggests that investing in infrastructure in regions with basic financial development can help these regions overcome barriers to economic growth.
- According to Economic Survey 2018, India will need about USD 4.5 trillion in the next 25 years for infrastructure development.

Challenges faced by infrastructure projects in India:

- **Political and regulatory risk:** it has many facets. There are various categories of approvals required across the project cycle at every stage, right from the pre-tendering stage to post-construction. They include community opposition on an investment, changes to asset-specific regulations and breach of contract terms. In the case of India, denial of payments from the government that go against contractual agreements seem to be perceived as highly likely to influence future investment decisions.
- **Land acquisition:** Several projects have been stalled or delayed due to land acquisition. There are multiple reasons that lead to delays in land acquisition. One primary reason has been resistance from farmers or local communities whose land is being acquired. Large road and energy projects can take several months to be awarded and if processes are not clear and impartial enough, investors hardly mobilize resources to bid.
- **Environmental Impact Assessment:** Environmental safeguards and guidelines are evolving, which are similar to the scale and complexity of infrastructure projects. While new projects need to comply with these regulations, even a project under construction may sometimes need to comply with revised standards midway through the execution stage.
- **Access to financing:** It touches upon the core feature of infrastructure: its long-term payback period. It affects financiers and investors who are looking for long-term and steady returns. After the global financial crisis though, long-term lending is not easy to get, India not being an exception.
- **Capacity of private players:** another emerging challenge for the achievement of large infrastructure projects is the capacity of the private sector to undertake or implement such projects.

Measures needed:

- **Land acquisition:** by relaxing transfer regulations for land it owns, the government has taken a positive step. This should resolve the delay of projects by procedural issues, and complement the guidelines to resolve land issues. The government is expected to follow up with land acquisition policies or guidelines for project authorities and sponsoring agencies
- **Fast-track policy and regulation reforms for enhanced implementation:** Sponsoring agencies need to make a concerted effort to develop strong performance management systems to drive timely execution of This includes defining performance standards for nodal agencies and creating a transparent and accurate tracking mechanism as well as performance-linked incentives and penalties.

- **Dispute resolution:** Given the extremely slow pace of Indian courts, this can be a long-drawn process. The government may also consider setting up single quasi-judicial authority for all the infrastructure sectors. This authority would have statutory powers to resolve disputes between the authorities and private developers.
- **Eliminate Regulatory Cholesterol:** A large number of projects are delayed due to delayed regulatory approvals or clearances from different agencies. Government agencies often function independently, and there is no incentive or obligation to cooperate with project authorities to expedite the approval process. To eliminate this issue, a Performance Review Unit should be given powers to gather information from nodal agencies on clearances and incentivise or regulate this.
- **Facilitating funds:** Setting up of Infrastructure Debt Funds (IDFs) and reduction in 'withholding tax' on the interest paid on these bonds are some other positive measures that are expected to facilitate the flow of long-term debt into infrastructure projects
- **Private-Public Partnerships:** Allowing the private sector into some former fully government-owned infrastructure sectors, such as telecommunications and domestic civil aviation, has produced exemplary results. Early experience with private involvement in these areas is generally positive, but outcomes under contracts need careful monitoring.
- **Independent authorities and facilitators:** The government has set up a Project Monitoring Group (PMG) to track frozen projects and remove bottlenecks. Any project in infrastructure can be referred to the group for resolution. The PMG has already been successful in resolving more than 200 of the projects referred to it, worth nearly 30% of the value of all projects, according to the World Bank.

Conclusion:

- If proper effort is made in expanding education, health facilities, and physical infrastructure and improving their quality by increasing budgetary allocation and improving governance, it will go a long way in reducing poverty, improving human development, and reviving and sustaining high rates of economic growth in India.

Q) Public investment, especially in the railways, can play an important role to revive growth and promote Make in India. Discuss. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The question intends to examine the role of Railways as a transport system in reviving the growth scenario.

Key demand of the question:

The question is about discussing the role of public investments in Railways to revive growth and promote the flagship program of Make in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the role played by railways in the economic growth and development.

Body:

The answer should explain the significance of public investments in Railways, in what way such investments will boost modernization of Indian railways.

The crux of the answer should focus on significance of Railways as a transport system in aiding the economic growth of the country.

Conclusion:

Conclude by suggesting way forward.

Introduction:

- Indian Railways (IR) has been the **prime movers of the nation**. IR is the **second largest railway system in the world** under single management. IR has historically played an important integrating role in the socio-economic development of the country.
- Despite reforms, the efficiency of service delivery is stumbling block in overall progress. Railway Minister recently rejected opposition's allegation that the government is working to privatise the national transporter, but said the ministry will invite investments for new technology, lines and projects in national interest.

**Body:**

Potential areas where private participation can be done:

- Indian railway is suffering from low investments, poor capacity, congestion, low speeds, and poor conditions of railway stations.
- The budgetary resources are not sufficient to make up for the investments required.
- PPP approach can be used to transform the railway in different areas comprising from ticketing, station construction and upkeep, rolling stock manufacturing, signalling etc.
- **The Bibek Debroy Committee**, which was set up to suggest ways to mobilise resources for the Indian Railways and restructure the Railway Board, has favoured privatisation of rolling stock: wagons and coaches.

Benefits of private investment in Railways:

- Opens opportunity for returns from investment in Rail Projects.
- Augmentation of railway infrastructure and decongestion of the railways.
- Ensure timely availability of Rail Infrastructure to the beneficiaries viz. Port, Industry and States.
- Better maintenance and efficiency in implementation of projects.
- The PPP projects in case of airports have shown that this mode greatly helps in improving quality of services.
- It leads to simplification of cost recovery for the money spent by the government in setting up the infrastructure. It would be profitable as the government would charge the operator
- The move would foster competition and hence lead to overall betterment in the quality of services.

Challenges:

- **Coverage Limited to Lucrative Sectors:** An advantage of Indian Railways being government- owned is that it provides nation-wide connectivity irrespective of profit. This would not be possible with privatisation since routes which are less popular will be eliminated, thus having a negative impact on connectivity. It will also render some parts of the country virtually inaccessible and omit them from the process of development.
- **Fares:** Given that a private enterprise runs on profit, it is but natural to assume that the easiest way of accruing profits in Indian Railways would be to hike fares, thus rendering the service out of reach for lower income groups.
- **Affects socio-economic development:** This will defeat the entire purpose of the system which is meant to serve the entire population of the country irrespective of the level of income
- **Accountability:** Private companies are unpredictable in their dealings and do not share their governance secrets with the world at large. In such a scenario it would be difficult to pin the accountability on a particular entity, should there be a discrepancy.

Way forward:

- Link increase in passenger fares to better passenger services
- Create a separate company for railway infrastructure
- Open access for any new operator who wishes to enter the market for operating trains
- Separate suburban services and run them as joint ventures with state governments.
- Private entry into running both freight and passenger trains in competition with Indian Railways
- Separation of rail track from rolling stock

Conclusion:

- High costs and lower returns, policy uncertainty, absence of a regulator to create a level playing field, the lack of incentives for investors and procedural or operational issues have significantly restricted private sector participation.

Q) Infrastructure expansion has witnessed noteworthy stimulus in India in the recent times. Discuss. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

India requires a huge corpus of investment in order to cope up for its infrastructure deficits. The sector has witnessed moderate growth recently and the government has also initiated various steps to boost investment in infrastructure sector.

Key demand of the question:

The answer must detail about the status of infrastructure growth in India and bring out in detail the impetus received by the sector recently.

**Directive:**

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In few lines bring out the current state of India's infrastructure sector, in what way it drives the economy.

Body:

Discussion should include the following:

First highlight the present stimulus that the sector is witnessing in India, what are the various provisions in terms of laws, policies, programs that the sector is gaining prospects from.

Explain what are the present infrastructure gaps existing currently, in what way these gaps can be addressed.

Conclusion:

Conclude with way forward.

Introduction:

- Infrastructure is a key driver of the overall development of Indian economy.
- It is seen that investments in infrastructure equal to 1% of GDP will result in GDP growth of at least 2% as infrastructure has a **"multiplier effect"** on economic growth across sectors. The recent headway made in developing transport infrastructure will prove to be the biggest enabler for growth.

Body:**Significance of Infrastructure expansion:**

- Infrastructure development helps in **poverty reduction** due to its high employment elasticity leading to huge job creation capabilities.
- It also has the **trickle-down effect** as better transportation infra can lead to access to education, health and other basic necessities.
- **Increasing the manufacturing growth** as there is better connectivity, easier movement of goods and services, facilitating private investments
- **It reduces the regional and inter-state disparities** and leads to a balanced economic growth by regional equality.
- Infra sector **has huge spill-over effects** on other sectors of economy. It **has money-multiplier** effect too.
- **Better quantity and quality of infrastructure** can directly raise the **productivity of human and physical capital** and in turn growth of nation

Stimuli for Infrastructure in India:

- **Market Size**
 - Foreign Direct Investment (FDI) received in Construction Development sector from April 2000 to June 2018 stood at US\$ 24.87 billion, according to the Department of Industrial Policy and Promotion (DIPP).
 - The logistics sector in India is growing 10 per cent annually and is expected to reach US\$ 215 billion in 2019-20.
- **Investments**
 - India has a requirement of investment worth Rs 50 trillion in infrastructure by 2022 to have sustainable development in the country. India is witnessing significant interest from international investors in the infrastructure space. Some key investments in the sector are listed below.
 - In June 2018, the Asian Infrastructure Investment Bank (AIIB) has announced US\$ 200 million investment into the National Investment & Infrastructure Fund (NIIF).
 - Indian infrastructure sector witnessed 91 M&A deals worth US\$ 5.4 billion in 2017
- **Government Initiatives**
 - The Government of India is expected to invest highly in the infrastructure sector, mainly highways, renewable energy and urban transport.
 - Announcements in Union Budget 2018-19:
 - Massive push to the infrastructure sector by allocating Rs 5.97 lakh crore for the sector.
 - Rs 16,000 crore towards Sahaj Bijli Har Ghar Yojana (Saubhagya) scheme. The scheme aims to achieve universal household electrification in the country.

- Rs 4,200 crore to increase capacity of Green Energy Corridor Project along with other wind and solar power projects.
- Allocation of Rs 10,000 crore to boost telecom infrastructure.
- A new committee to lay down standards for metro rail systems was approved in June 2018. As of August 2018, 22 metro rail projects are ongoing or are under construction
- The Government of India is working to ensure a good living habitat for the poor in the country and has launched new flagship urban mission, the Pradhan Mantri Awas Yojana (Urban).
- In May 2018, construction of additional 150,000 affordable houses was sanctioned under Pradhan Mantri Awas Yojana (PMAY), Urban.

However, there are still **challenges which need to be tackled**.

- **Delay in Implementation and execution:** While issues around land acquisition and the time required for approvals have seen improvement over the years, India needs to ensure that such problems continue to receive constant attention.
- **Environmental Impact Assessment:** Environmental safeguards and guidelines have proven to be one of the major reasons for delay in infrastructure projects, like roads and ports.
- Given the complexity of infrastructure assets, a “**one size fits all**” solution will not work. Different models of **PPP ownership** like Hybrid Annuity, BOT needs to be tried.
- The **capital investments in infra projects are huge**, with the **NPA crisis** seen across public sector banks, credit availability has become difficult. This has in turn lead to **twin-balance sheet syndrome** with the infrastructure companies also defaulting on their payments.
- **Regulatory issues: Lack of co-ordination between various Government agencies** affecting the ease of doing business due to delayed clearances and objections.
- **Absence of a proper dispute resolution mechanism** between private players and government agencies leading to pendency of cases in courts as well as the assets in limbo.
- **Poor pre-construction planning:** Due to the already adverse effect of various impediments like land acquisition, statutory approvals, delayed financial closure, etc. the pre-construction phase of infrastructure projects is pretty long.
- Other challenges include **Geographical** as some regions are unsuitable for infra projects, **Ethnic**, etc.

Conclusion:

- If proper effort is made in expanding education, health facilities, and physical infrastructure and improving their quality by increasing budgetary allocation and improving governance, it will go a long way in reducing poverty, improving human development, and reviving and sustaining high rates of economic growth in India.

Q) Do you agree that the much of the current crisis facing Indian railways is originating from the fragmented structure of the rail bureaucracy? Critically analyse. (250 words)

Reference

Why this question:

The question aims to analyse the issues and concerns marring the Indian railways system specifically in the domain of bureaucracy.

Key demand of the question:

Explain in detail the various issues concerning the Indian railways system in what way the issues can be addressed.

Directive:

Critically analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Highlight the current state of railway affairs in India.

Body:

Explain the following points in detail –

Discuss first how railways have come far ahead in time.

Explain specific issues that still surround it despite dedicated policies and programs in place.
 Quote the reasons due to which the issue still persists, in what way they can be resolved.
 Discuss the idea of third service cadre — the Indian Railways Management Service, the idea is that the IR management service — drawing talent from the technical and logistics services etc. as solutions to the existing problems.

Conclusion:

Conclude by suggesting way forward.

Introduction:

- Indian Railways (IR) has been the **prime movers of the nation**. IR is **the second largest railway system in the world** under single management. IR has historically played an important integrating role in the socio-economic development of the country.
- Railways has been crying out for help for decades. Despite the huge allocation of funds that it gets each year, the lifeline of India continues to suffer.

Body:

- Extra information:** The Indian Railways — that runs 19,000 trains including 12,000 passenger trains to carry 24 million passengers each day on its 65,000 km tracks — confronts big challenges. Its networks are clogged, with approximately 492 of the total of 1219 sections — 40 percent of all sections — running at over 100 percent of above-line capacity. From 1950 to 1916, passenger and freight traffic grew by 1,344 percent and 1,642 percent respectively, while the network increased by a mere 23 percent

Bureaucratic hurdles:

- Bureaucratic culture** with high opaqueness and snail's rate progress.
- Officials engaged in furthering cadre goals; rather than working to fulfil the organisational goals
- Multiple recruitment techniques:** With a bench strength of over 13 lakh, the Indian Railways — the world's fourth largest rail network — has drawn personnel from three different entry points (through UPSC, direct recruitment or from the now-defunct Rail Training Institute at Jamalpur)
- Fragmentation:** IR is split up into five technical cadres (Indian Railway Service of Signaling Engineers, Indian Railway Service of Mechanical Engineers, Indian Railway Service of Mechanical Engineers) and three non-technical services (Indian Railways Traffic Service, IR Accounts Services and IR Personnel Service).
- Cadres such as the IRSS and the IRPS — that had a critical role in the early decades of the country's Independence in the absence of a domestic rail industry — continue to retain an elaborate structure despite a much reduced role.
- The IR's rolling stock has graduated from the simple steam engine machines to complex technological products, but the 29 workshops continue to be engaged in antiquated practices.

Other crises faced by IR:

- Subsidised passenger tariff** due to political incentives. This leads to an increase in freight rate which adds to inflation.
- Declining passengers in the upper classes as they have started preferring bus for short haul and flight for the longer haul. Nearly a third of passenger revenue comes from AC class passengers who constitute just 1.3 per cent of the total number of passengers travelling in a year.
- The **share of roads in freight transport is more** than half in India; while in China, it is only 30%. As more highways are getting built rapidly, the share of roads in freight transport is increasing at accelerating rate.
- Freight contributes nearly two-thirds of Indian Railway's revenue and coal transport alone contributes to half of that. Decreasing dependency on coal compounded by increasing thrust on renewable energy has crippled railway revenue.
- Regional air connectivity scheme UDAN is further going to increase Indian Railway's operational cost. India, recently, became the third-largest aviation market in the world after China and the US.
- Lack of funds:** In China, annual investment in railways is about Rs. 9 to 10 lakh crore whereas it is Rs. 40,000 crore a year in India. Over 80 percent of this budget goes towards wages and salaries.
- Unfilled vacancies** at the lower level (track men, line men, technicians).
- Railways diverting from core issues of railway safety and operation and is diverting to populist needs like wifi, catering, etc.

Measures needed to tackle bureaucratic hurdles:

- Reduce red tape and bring in efficiency. A mechanism for departments to flourish and voice their genuine concerns is what is needed for enhancing co-ordination.
- Use of new techniques for assessing aptitudes, capabilities and cohesion are to be developed.

- Ultimately, appropriate powers should be vested in the DRMs, GMs and the Railway Board for hassle free decision making.
- Streamlining by amalgamation of eight existing railway services — besides the Railway Protection Force (RPF) and the Railway Medical Services (RMS) into two verticals: The Indian Railways Technical Service and the Indian Railways Logistics Service
- a third service cadre like Indian Railways Management Service must be put in place
- Bureaucratic reform — or the proposal to unify cadres — might well be a desired objective.
- To adopt a policy of a unified or a two-cadre system with retrospective effect
- The long-awaited plan of setting up an independent tariff and safety regulator — called the **Rail Development Regulator** — remains to be put to effect
- A **Corporate Accounting System** — to replace the conventional accrual-based accounting system.

Other measures:

Bibek Debroy Committee on Restructuring of Indian Railways:

- Need for the creation of separate tariff regulator so as to keep railway away from politics.
- Railway's recruitment should be done by single entity instead of UPSC, SSC
- Further needs to decentralize railway operation to increase efficiency.
- Need to decrease cross subsidization by keeping a balance between freight and passenger fare.
- Railway budget should be merged with the annual budget.
- Shifting towards online procurement and auctioning.

Conclusion:

- Indian Railways needs to learn from ISRO in target driven goals, team spirit, Research and Development, transparency, speed and active collaboration with the private sector. "Process, structural and cultural reforms" are the needs of the hour to resuscitate the IR.

Q) Examine how 'smart grids' can be a solution to India's power woes. Discuss the challenges and issues involved in its implementation. (250 words)

[livemint](#)

Why this question:

The question is to examine the concept of smart grids.

Key demand of the question:

The answer must discuss the concept of smart grids, the challenges and issues involved in implementing the same and in what way it can address the power woes of the country.

Directive:

Examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Discuss in brief the current power scenario of the country with some statistical data.

Body:

Explain that Smart grid (SG) is emerging as a new facet of power industry. It incorporates numerous advanced technologies to deal issues prevailing with conventional electric networks. Though capable to resolve many of these issues, SG is still facing challenges in deployment. These challenges are associated with adaption of emerging technologies, socio-economic issues, lack of policies and awareness.

Conclusion:

Conclude with what needs to be done and how the concept can be put to use effectively to deal with the power problems of the country.

Introduction:

- Smart grid is an electricity grid that is used to deliver electricity using two way technology to enable communication between consumers and utility.
- Smart grid manages electricity demand in a reliable, efficient and sustainable manner.
- In May 2015, Government approved the National Smart Grid Mission (NSGM) -an institutional mechanism for planning, monitoring and implementation of policies and programs related to Smart Grid activities.

**Body:****Potential of Smart Grids:**

- A smart grid involves a network of sub-stations, transformers, and electric lines that help in delivering electricity from power plant to business offices and homes.
- Similar to the internet, a smart grid also involves the use of computers, automation, controls, and new technologies working in conjunction with each other.
- The key advantage of smart grid technology is its ability to create stability between electricity demand and supply.
- The smart grid enables increased, predictability and control of generation and demand through consumer involvement, thus bringing flexibility in both generation and consumption, enabling the utility to better integrate intermittent renewable generation and reducing costs of peak power.
- A smart grid is cost-effective, responsive, and engineered for reliability of operations.

Challenges and issues involved in its implementation:

- **Policy and regulation:** The current policy and regulatory frameworks were typically designed to deal with the existing networks and utilities.
- **High capital and operating costs:** Capital and operating costs include large fixed costs linked to the chronic communications
- **Benefits are constrained by the regulatory framework:** When calculating the benefits, organizations tend to be conservative in what they can gather as cash benefits to the shareholders. For example, in many cases, line losses are considered to be put onto the customer and as a result any drop in losses would have no net impact on the utility shareholder.
- **Technology maturity and delivery risk:** Technology is one of the essential constituents of Smart Grid which include a broad range of hardware, software, and communication. In some cases, the technology is well developed; however, in many areas the technologies are still at a very initial stage of development and are yet to be developed to a significant level.
- **Lack of awareness:** Consumer's level of understanding about how power is delivered to their homes is often low.
- **Access to affordable capital:** Funds are one of the major roadblocks in implementation of Smart grid.
- **Cyber security and data privacy:** With the transition from analogous to digital electricity infrastructure comes the challenge of communication security and data management; as digital networks are more prone to malicious attacks from software hackers, security becomes the key issue to be addressed, concerns on invasion of privacy and security of personal consumption data arises. The data collected from the consumption information could provide a significant insight of consumer's behavior and

Way forward:

- Creating frameworks that allow risk to be shared between customers and shareholders, so that risks and rewards are balanced providing least aggregate cost to the customer.
- Consumers should be made aware about their energy consumption pattern at home, offices.
- Policy makers and regulators must be very clear about the future prospects of Smart Grids.
- Utilities need to focus on the overall capabilities of Smart Grids rather than mere implementation of smart meters. They need to consider a more holistic view.

Conclusion:

- Indian utilities are still lagging far behind when compared to other countries. Smart Grids will play a vital role to help utilities in accomplishing this mission.
- So, the utilities will need to invest heavily in new hardware, software, business process development, and staff training.
- Further there would be high investment in home area networks and smart appliances by the customers. Achieving the broader view of Smart Grid will require complex task prioritization and right set of policies and regulations to be in place.

Q) Infrastructure is the backbone of India Economy. Discuss the measures taken by the government to boost infrastructure development in the recent Budget. (250 words)

[Economictimes](https://economictimes.com)

**Why this question:**

The question aims to analyse the role played by infrastructure development in growth and development of the country.

Key demand of the question:

The answer must analyse the measures taken by the government to boost infrastructure development in the recent Budget.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Begin with brief write up on present state of infrastructure in India.

Body:

Discussion should include the following:

Infrastructure sector is a key driver for the Indian economy. The sector is highly responsible for propelling India's overall development and enjoys intense focus from Government for initiating policies that would ensure time-bound creation of world class infrastructure in the country.

Discuss the recent allocations made in the Budget and explain the significance.

Conclusion:

Conclude with way forward.

Introduction:

- Infrastructure is a key driver of the overall development of Indian economy. It is seen that investments in infrastructure equal to 1% of GDP will result in GDP growth of at least 2% as infrastructure has a “**multiplier effect**” on economic growth across sectors.
- The recent headway made in developing transport infrastructure will prove to be the biggest enabler for growth.

Body:**Significance of Infrastructure expansion:**

- Infrastructure development helps in **poverty reduction** due to its high employment elasticity leading to huge job creation capabilities.
- It also has the **trickle-down effect** as better transportation infra can lead to access to education, health and other basic necessities.
- **Increasing the manufacturing growth** as there is better connectivity, easier movement of goods and services, facilitating private investments
- **It reduces the regional and inter-state disparities** and leads to a balanced economic growth by regional equality.
- Infra sector **has huge spill-over effects** on other sectors of economy. It **has money-multiplier** effect too.
- **Better quantity and quality of infrastructure** can directly raise the **productivity of human and physical capital** and in turn growth of nation

Measures in recent budget to boost infrastructure:

- National Common Mobility Card: India's first indigenously developed payment ecosystem for transport, based on National Common Mobility Card (NCMC) standards.
- **Ease of Travelling:** Inter-operable transport card runs on RuPay card and would allow the holders to pay for bus travel, toll taxes, parking charges, retail shopping.
- **Roadways:**
 - Massive push given to all forms of Physical Connectivity via: Bhartamala (road and highways project) and Sagarmala projects (national water port development connectivity scheme), Pradhan Mantri Gram Sadak Yojana (PMGSY), Jal Marg Vikas and UDAN Schemes, Industrial Corridors and Dedicated Freight Corridors.
 - State road networks to be developed in 2nd phase of Bharatmala project.
 - National Highway Programme (NHP) to be restructured to ensure a National Highway Grid, using a financeable mode

- **Waterways:**
 - **Jal Marg Vikas Project:** Under it Navigational capacity of Ganga to be enhanced through multi modal terminals at Sahibganj and Haldia and a navigational lock at Farakka by 2019-20.
 - **Ganga Waterways:** 4 times increase in next 4 years estimated in cargo volume on Ganga, leading to cheaper freight and passenger movement and reducing import bill.
- **Railways:**
 - For Railway Infrastructure during 2018-2030, Rs.50 lakh crore investments is needed.
 - Public-Private-Partnership (PPP) proposed for development and completion of tracks, delivery of passenger freight services and rolling stock manufacturing.
 - 657 kilometres of Metro Rail network has become operational across India.
- **e-vehicles:**
 - Outlay of Rs. 10,000 crore for 3 years approved for Phase-II of FAME (Faster Adoption and Manufacturing of (Hybrid &) Electric Vehicles) Scheme
 - Upfront incentive proposed on purchase and charging infrastructure, to encourage faster adoption of Electric Vehicles (EV).
 - Under FAME Scheme only advanced-battery-operated and registered e-vehicles to be incentivized
- **Aviation:**
 - Policy interventions to be made for development of Maintenance, Repair and Overhaul (MRO), to achieve self- reliance in aviation segment
 - Government will be laying a Regulatory roadmap for making India a hub for aircraft financing and leasing activities from Indian shores.
- **Power:**
 - To be provided to states at affordable rates ensured under 'One Nation, One Grid' and package of power sector tariff and structural reforms to be soon announced.
 - Undesirable duties on captive generation or open access sales for industrial as well as other bulk power consumers to be removed under Ujjwal DISCOM Assurance Yojana (UDAY).
 - Blueprints to be made available for water grids, gas grids, i-ways, and regional airports
- **Gas:**
 - Implementing HLEC (High Level Empowered Committee) Recommendations which is- Addressing low utilization of gas plant capacity due to paucity of Natural Gas;
 - Retirement of old & inefficient plants.
- **Housing:**
 - Model Tenancy Law to be finalized and circulated to all states in country
 - To promote rental housing appropriate reform measures are to be taken up
 - For public infrastructure and affordable housing on land parcels held by Central Government and Central Public Sector Enterprises (CPSEs), a joint development and concession mechanisms to be used

Infrastructure financing:

- There is a need to mobilise alternative financing resources through an effective asset monetisation strategy.
- Credit Guarantee Enhancement Corporation to be set up in FY 2019-2020
- To deepen the market for long term bonds Action Plan to be put in place with focus on infrastructure
- Proposed transfer/sale of investments by FIIs (Foreign Institutional Investor)/FPIs (Foreign portfolio investment) (in debt securities issued by IDF-NBFCs) to any domestic investor within specified lock-in period
- To enable securities exchange (or stock exchange) to allow AA rated bonds as collaterals
- **Social stock exchange:**
 - Electronic fund raising platform under regulatory ambit of SEBI (Securities and Exchange Board of India)
 - Listing social enterprises and voluntary organizations
 - To raise capital as debt, equity or units like a mutual fund
- **Annual Global Investors Meet** to be organized by Government in India, using National Infrastructure Investment Fund (NIIF) as an anchor to get all three sets of global players (pension, insurance and sovereign wealth funds).
- The statutory limit for FPI investment in a company is suggested to be increased from 24% to sectoral foreign investment limit. Also, option to be given to the concerned corporate to limit it to a lower threshold
- FPIs to be permitted to subscribe to listed debt securities issued by Real estate investment trusts (REITs) and Infrastructure investment trusts (InvITs).

- **NRI-Portfolio Investment Scheme Route** is proposed to be merged with FPI Route.
- Cumulative resources garnered through new financial instruments such as InvITs, REITs as well as models like Toll-Operate-Transfer (ToT) exceed Rs. 24,000 crore

Conclusion:

- If proper effort is made in expanding education, health facilities, and physical infrastructure and improving their quality by increasing budgetary allocation and improving governance, it will go a long way in reducing poverty, improving human development, and reviving and sustaining high rates of economic growth in India.

Q) Examine the developments of Waterways in India through Joint Ventures under private participation. What are the challenges faced by the authorities in this regard? Discuss. (250 words)

Ethics by Lexicon publications

Why this question:

The question is direct and intends to evaluate the conditions of waterway transport and its contribution to the economy and transport sector of the country.

Key demand of the question:

Explain in detail the nuances of developments of Waterways in India, associated challenges, prospects and way ahead.

Directive:

Examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief list down facts related to waterways in India, its prospects. India with a extensive network of rivers, canals, lakes has approximately 14500 km of navigable waterways.

Body:

Explain the following aspects –

First list down the prospects of waterways in India.

Discuss the possible challenges the sector can face – geographical, political, investments etc.

Explain the significance of public-private partnership in realizing the true potential of it.

Conclusion:

Conclude by suggesting way ahead.

Introduction:

- Rivers, lakes, canals, backwaters and reservoirs primarily constitute the source for inland waterways. A stretch of water, not part of the sea, over which craft of a carrying capacity not less than 50 tonnes can navigate when normally loaded is called navigable inland waterway.
- As per the National Waterways Act, 2016, 111 have been declared as National Waterways (NW). These waterways pass through 24 states and two union territories, with an approximate total length of 20274 km. These proposed waterways will pass through nearly 138 river systems, creeks, estuaries and related canal systems of India.

Body:

Potential of IWT in India:

- **Cost savings:**
 - Fuel and Energy Efficient: It is fuel-efficient compared to the other modes of transport, rail and road. For example, the Integrated National Waterways Transportation Grid Study states that one litre of fuel will move 24 tons through one kilometre on road, 85 on rail and 105 km on inland water transport. Further, 1 HP can 150 kg on road, 500 kg on rail and 4000 kg on water.
 - Cost of developing waterways is much lower than rail & road.
 - Reduces transportation and transition losses

- **Environment Friendly:**
 - Least fuel consumption per tonne-km
 - Carbon dioxide emission is 50% of trucks
 - Negligible land requirement as compared to rail and road transport
- **Supplementary Mode:**
 - Reduces pressure on road and rail
 - Reduces congestion and accidents on road
- **Optimal Modal Mix:** It will provide optimal modal mix by converging river transport with other modes
- **Better connectivity:** It helps create seamless interconnectivity connecting hinterlands along navigable river coasts and coastal routes. Further, riverine routes are likely to play a crucial role in connecting the north-eastern states to the mainland
- Inland Waterways hold huge potential for domestic cargo transport, cruise, tourism and passenger traffic.
- Development of inland waterways will help in the generation of job opportunities

Need for Private partnership in development of Waterways in India:

- Achieving infrastructure investment of 5% of GDP requires considerably more private sector contribution.
- Private sector participation in infrastructure delivery helps deliver tangible benefits.
- The private sector has also delivered efficiently—both on project execution as well as
- Private participation enhances public accountability.
- Public private partnership (PPPs) brings back trust in public utilities that execute them, improve service delivery and bridge resource gaps.
- Reviving the stalling private sector investments is crucial to accelerate the infrastructure build-up that India needs, aspires for, and deserves.

Challenges faced:

- **Regulatory challenges**
 - There is lack of modal integration of and detailed mapping of waterways and industrial clusters and also lack of integration of hinterland coastal shipping with international maritime traffic.
 - Lack of level playing policy (waterways were not on the national horizon for planning and connectivity for long time) among different modes of transport.
 - Lack of uniformity in legal and administrative issues as inland waterways move through more than one state.
- **Political challenges**
 - Inter-linking of rivers is a major issue, which is yet to materialize.
- **Financial challenges**
 - Under investment by the government.
 - Private sector participation in MRO is dismal.
 - Construction of dams/barrage to increase depth of navigation faces challenges of economic viability.
- **Geographical challenges:**
 - Increased siltation: Reduced navigability due to siltation, as in the Bhagirathi-Hooghly and in the Buckingham Canal.
 - Reduced waterflow: Reduced flow due to diversion of water for irrigation, for instance, in the Ganga which makes it difficult even for steamers to ply.
 - Geographical constraints: There are problems in smooth navigation because of waterfalls and cataracts, as in Narmada and Tapi.
- **Technical challenges:**
 - Inadequate depth: Lack of inadequate depth of waterways for commercial movement of cargo is a major concern. Also quality of water flow is becoming poorer progressively.
 - Inadequate air draft: Multiple bridges with low vertical clearance obstruct the passage of bigger vessels. E.g.: It is faced in NW3.
 - Shortage of IWT vessels: Due to its capital incentive nature India lacks in vessel building
 - Lack of terminals: It inhibits door-door connectivity to end users.
 - Lack of navigation infrastructure: Rudimentary infrastructure coupled with non-availability of water round the year is an impediment for operation of waterways.
 - Shortage of MRO facilities: There is severe shortage of Maintenance, Repair, Overhaul facilities for inland water transport vessels.

**Measures needed:**

- **Private Partnership:**
 - The government should focus on developing navigation, channel operation and maintenance, and external connectivity infrastructure.
 - Private players can undertake terminal development, cargo and passenger handling, and building low-draft vessels and related repair facilities.
 - Capable creditworthy public institutions are an essential prerequisite to attract private investment.
 - Expediting creation of a PPP think-tank institution as recommended by the **Kelkar committee** could help.
 - Create supply-side enablers to deepen the infrastructure financing ecosystem
 - Stalled projects need to be dealt with steadfastly to nurse private developers and financial institutions to health. Building certainty and capacity to implement the Insolvency and Bankruptcy Code will be crucial.
 - Allied guarantee instruments to strengthen bond markets and expeditious deployment of capital under the National Investment and Infrastructure Fund are facilitations that can help.
 - Transparency and effective policies will be crucial. Project-wise analysis is required to determine as to who is better placed to take care of the three essential components of each project, i.e., Build, Operate and Finance.
- **Industrial Incentives:**
 - The Government can mandate/incentivise industries in the proximity of national waterways to use this mode for a portion of their shipments.
 - Public sector entities such as Food Corporation of India, power plants and refineries can be similarly mandated.
- **Sustainable transport model:**
 - For synergy, the government can promote industrial corridors along riverbanks and foster waterways-based industrialisation.
 - This will not only ensure captive IWT cargo, but also tackle erosion of riverbanks as industries will tend to protect the land allotted to them.
- **Promoting tourism:**
 - Along with passenger terminal development, the government needs to offer financial support to ferry operators to improve safety, and facilitate insurance coverage.
 - The Centre and States need to join hands to package and market river tourism in a big way to trigger a virtuous cycle.

Conclusion:

- Thoughtful policies and infrastructure development using the PPP model can give a boost to the cheapest transport mode.
- A holistic and concerted effort can change India's transportation landscape, de-congest arterial roads, and even improve quality of life across geographies.

Q) National urban transport policy highlights on moving people instead of moving vehicles. Discuss critically the success of various policies of the government in this regard. (250 words)

Why this question:

The question intends to evaluate the policies of the government with respect to urban transport and in what way such policies have been successful in achieving the mandate of moving people and not just vehicles.

Key demand of the question:

The answer must discuss the vision of the National Urban Transport Policy (NUTP) and in what way its ambitions are in the right direction. Discuss various government policies in this direction.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction of the National Urban Transport Policy .

Body:

Discussion should include the following:

The policy is to be critically analyzed vis-a-vis its achievement, challenges and various plans of the government.

Provide for a detailed perspective of public transport, explain that the need of the hour is to emphasize more on the movement of public transport and its facilitation; whereas, the government makes attempt for smoothening the roads and facilitation of vehicles, not necessarily the public transports.

List down government policies and programmes in this direction with recent examples.

Conclusion:

Conclude with way forward.

Introduction:

- The Government formulated a National Urban Transport Policy (NUTP) in April, 2006 which envisages safe, affordable, quick, comfortable, reliable and sustainable urban transport systems, establishment of quality focused multi-modal public transport systems that are well integrated, providing seamless travel across modes, land use transport integration, introducing intelligent transport systems for traffic management etc.

Body:

- The objective of this policy is to ensure safe, affordable, quick, comfortable, reliable and sustainable access for the growing number of city residents to jobs, education, recreation and such other needs within our cities.

The positive impact of the policy can be seen in more number of people using public transport.

- Encouraging integrated land use and transport planning in all cities so that travel distances are minimized and access to livelihoods, education, and other social needs, especially for the marginal segments of the urban population is improved, however the interest of every section and region of the society should be addressed.
- Bringing about a more equitable allocation of road space with people, rather than vehicles, as its main focus.
- Establishing effective regulatory and enforcement mechanisms that allow a level playing field for all operators of transport services and enhanced safety for the transport system users.
- Building capacity (institutional and manpower) to plan for sustainable urban transport and establishing knowledge management system that would service the needs of all urban transport professionals, such as planners, researchers, teachers, students,

Challenges to the policies:

- However, various strategies of the Government like BRT, JNNURM, etc have not solved many of the problems.
- **Unprecedented Transport Growth:** According to Niti Aayog, the number of registered motor vehicles has increased from 5.4 million in 1981, to 210 million in 2015. This rapid growth in demand in the absence of widespread public transport system has caused a rapid increase of private car ownership in India.
- **Inadequate Public Transport:** According to government data, there are about 19 lakh buses in the country and only 2.8 lakh of them are run either by state transport undertaking or under stage carriage permits.
- Further, a CSE study points out that the share of public transport is expected to decrease from 75.5% in 2000-01, to 44.7 per cent in 2030-31, while the share of personal transport will be more than 50%
- **Urban Pollution:** According to a WHO study 14 out of the top 15 most polluted cities in the world belong to India. Vehicular pollution has been one of the major contributors to rising urban air pollution in Indian cities along with other factors such as construction activity, road dust and industrial activity.
- **Urban Congestion:** Major Indian cities like Delhi, Mumbai, Kolkata and Bengaluru are ranked among world's most congested cities. For example: Average speed for vehicles in Bengaluru is reported as 17 km/h. These high levels of congestion have huge economic implications in the form of reduced productivity, fuel waste, and accidents. Further, there is an acute shortage of parking spaces both on and off the streets in the urban centres.
- **Road safety:** Traffic injuries and fatality: According to the Report 'Road Accidents in India-2016', road accidents in India have decreased by around 4.1% in 2016 from 2015. However, fatalities resulting from these accidents have risen by about 3.2%. The major reasons for traffic crashes include poor quality of roads, poor traffic management, unsafe and overcrowded vehicles and unsafe driving behaviour.
- **Equity Issues:** Unplanned urbanization in India has led to gentrification (as per upper and middle socio-economic class) of city centres and lower income groups are forced to live in peripheral suburbs which have increased their cost and time they allocate to commute. Most of the lower income groups and urban poor fail

to afford private transport and even public transport are high for them. For example, a CSE study ranks Delhi Metro as the second most unaffordable metro (after Hanoi in Vietnam) with lower income group people spending nearly 22% of their monthly transport on Delhi Metro fares.

- **Mobility for women:** Safety or the lack thereof, is the single biggest factor constraining women's mobility. According to Action Aid UK, 79% of women in major Indian cities reported being harassed on streets.

Way forward:

- To address the institutional challenges there is a need for better cooperation among different transport agencies, departments, and ministries as well as better coordination of transport and land-use policies. Further, there should be adequate funding to address various issues plaguing public transport infrastructure
- To address the issues of urban congestion and urban air pollution, it is important to augment mass and share transit capacity and discourage use of private cars by enforcing restraint measures through parking policy, low emissions zones approach, tax measures and congestion pricing.
- Further, policies toward enhancing public transport should promote inclusive access to mobility.
- Well engineered, safe infrastructure for travel should be ensured. Further, there is an urgent need to address the issue of low woman mobility by ensuring women safety through gender-sensitive transport policies, dedicated seats/ coaches and emergency helplines.
- There should be focus on enhancing non-motorised transport. Focus should be to encourage use of non-motorised transport for short distances. Further, Pedestrian zones, bike lanes should be made to ensure safety to commuters. For example, well designated Bike-lanes and bike-sharing solutions have promoted use of bicycles as a mean of transport in cities like Amsterdam and Paris.
- Commuters should be provided with multiple modes of connectivity. To ease out travelling, a single smart card can be provided. For example, London's Oyster "smart" card enables a commuter to change from one mode to another with minimal loss of time or effort.

Conclusion:

- There is a need for more equitable allocation of road space with people, rather than vehicles. Besides intelligent transport systems should be introduced and institutional mechanism for enhanced coordination between agencies and between agencies and people should be established.
- There is a need for 3C Framework (Clean, Convenient and Congestion free) for transforming mobility in India

Q) What do you understand by a low carbon transport system ? Discuss the prospects India holds in transitioning to a low carbon transport system. (250 words)

The hindu

Why this question:

The question is based on the theme of low carbon transport system and significance of the same.

Key demand of the question:

The answer must discuss in detail the prospects of having a low carbon transport system and the positive effects of it on the economy, environment and other aspects of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is low carbon transport system.

Body:

Explain the following dimensions in detail:

What is low carbon transport?

What can humans do to be sustainable in transportation?

Is public transport sustainable?

Why is sustainable transport important?

Explain how all of it rests on accessing public service, choosing rapid transit over car driving and supporting electric vehicle transition etc.

Discuss Indian scenario and what needs to be done.

Conclusion:

Conclude with way forward.

**Introduction:**

- Low carbon transport system can be defined as mobility that results in substantially lower levels of carbon emissions and can be considered as the ultimate goal for transport policy, planning as well as research.
- The idea of low carbon transport system rests on accessing public service, choosing rapid transit over car driving and supporting electric vehicle transition.
- **Global Carbon Project** reports that India's carbon emissions are rising more than two times as fast as the global rise in 2018.

Body:**Need for low-carbon transport system in India:**

- **Urbanisation:** With the exponential growth of the population, need for transportation arises, where present transportation is mostly relying on fossil fuels, so the need for low-carbon transportation is imminent.
- **Economic growth:** Cities are referred to as the "engines of economic growth". Despite having only about 30% of the total population, nearly 62-63%, of India's Gross Domestic Product (GDP) comes from the urban areas. With increasing growth in future, there is a need for low-carbon growth.
- **Pollution:** As per a WHO study, fourteen out of the top fifteen most polluted cities in the world belong to India. Polluted air significantly reduces the quality of life and increases the risk of diseases such as lung cancer, stroke, heart disease, and chronic bronchitis.
- **Losses:** As per the World Bank, India's welfare losses due to air pollution are currently estimated at 7.7% of GDP (PPP adjusted). By going low carbon emission vehicles huge amount of expenditure will be saved on pollution related health problems.
- **Congestion:** As per a WEF study, the number of Million-plus urban agglomerations has increased from 35 (2001) to 53 (2011). By 2030, the number is expected to grow to 87. Major Indian cities are now consistently ranked amongst the world's most congested cities. These high levels of congestion have huge cost in the form of reduced productivity, fuel waste, and accidents.
- **Two-wheelers:** The two-wheeler sales in India have grown at a CAGR of ~8% during FY14-18 period with FY18 witnessing a 14.8% Year-on-Year growth. The faster growth in two-wheeler sales is mainly due to rising income levels, growing infrastructure in rural areas and rising trend of scooterization.
- **Discretionary spending:** As Indian economy continues to grow at fastest pace the disposable income in India is also witnessing rapid improvement, which in turn is leading to faster rise in discretionary spending. This led to increase in purchase of premium vehicles. Premium vehicles run on more fuel per kilometer, so there is need to improve the fuel efficiency in this segment.

Prospects for India:

- Reducing the CO2 emissions of road transport leverages multiple co-benefits, for example improving air quality and increasing physical activity, which are critical for well-being, particularly in urban areas.
- Prevent Premature Deaths.
- The economic cost associated with mortality from air pollution is large, amounting to several % of GDP for many countries which can be addressed through a low carbon transport system.
- It provides strong economic development.
- Decreased Local Environment Damages.
- Low-carbon transport can improve energy security for individuals, businesses and national economies.

Challenges involved towards transition to LCTS:

- The way cities are built and the design of public transit are critical for low-carbon mobility systems.
- Unprecedented Transport Growth, i.e. rapid growth in demand in the absence of widespread public transport system has caused a rapid increase of private car ownership in India.
- Gaps in government Laws and regulations.
- Poor Institutional Framework.
- Human Resource Challenges which is Lack of urban transport skills amongst city and state officials is a major challenge in effectively implementing transport project.

Measures needed:

- Mayors and Town planners should organise cities around public transport and cycling, thereby improving mobility for many, while limiting car use.
- Uptake of non-motorised transport which can be a sweet spot of sustainable development, resulting in both lower emissions and better public health.
- The expansion of public transport in the form of large capacity buses, light rail transit, and suburban rail or metro is a feasible option for transport sector.

- India should double down on its strategy to transition to **electric two and three-wheelers**.
- Use of communication and information technologies can help avoid or reduce the need to travel.
- City managers should ensure that existing urban areas provide short routes and fast access to schools, hospitals and jobs.
- **NITI Aayog Recommendations** which calls for a 3C Framework (Clean, Convenient and Congestion free) for transforming mobility in India.

Conclusion:

- India is one of the world's largest producers and consumers in two- and three-wheelers and Indian companies can take a leading role in switching to electric vehicles. This will also help in transforming India's vision of 'Make in India'.
- Providing access to public service, choosing rapid transit over a car driving in cities and supporting the rise of electric two and three-wheelers will help drive India to a modern and low-carbon transport system fit for the 21st century.

Q) Discuss the critical role that development of the Blue Economy can play in nation building. Explain the prospects with possible challenges in implementation of the same. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article talks about the mention of blue economy in the recent budget that was passed by the parliament.

Key demand of the question:

The answer must bring out the significance, prospects and potential the blue economy holds for India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief intro on what you understand by blue economy.

Body:

Discussion should include the following:

The concept was introduced by Gunter Pauli in his 2010 book- "The Blue Economy: 10 years, 100 innovations, 100 million jobs".

It is the sustainable use of ocean resources for economic growth, improved livelihoods and jobs, and ocean ecosystem health.

It advocates the greening of ocean development strategies for higher productivity and conservation of ocean's health.

List down the possible merits of blue economy.

What are the policies and programmes that are required to be undertaken to make the blue economy contribute to the GDP (take hints from the article.)

Conclusion:

Conclude with way forward.

Introduction:

- "Blue Economy" refers to strategic and sustainable use of Marine Resources for the development of Economy and the well-being of human.
- **Gunter Pauli's book, "The Blue Economy: 10 years, 100 innovations, 100 million jobs"** (2010) brought the Blue Economy concept into prominence. It offers "Green Approach" to meet the aspirations of mankind.
- India is endowed with a vast coastline of approximately 7500 Km and hence better placed to harness the "potential of oceans" – **with an Exclusive Economic Zone (EEZ) of 2.02 mn. sq.km**. It is an upcoming **sunrise sector**.

**Body:****Potential of Blue economy in India:**

- **Economy:**
 - Blue economy, through sustainable use of oceans, has great potential for boosting the economic growth by providing opportunities for income generation and jobs etc.
 - It can support food security, and diversification to address new resources for energy, new drugs, valuable chemicals, protein food, deep sea minerals, security etc.
 - At least 3-5% of global GDP is derived from oceans
- **Socio-Economic Development:**
 - Blue economy presents India with an unprecedented opportunity to meet its national socio-economic objectives as well as strengthen connectivity with neighbours.
 - Blue Economy can help in focusing on livelihood generation, achieving energy security, building ecological resilience, and improving health and living standards of coastal communities.
 - Blue economy would reinforce and strengthen the efforts of the Indian government as it strives to achieve the SDGs of hunger and poverty eradication along with sustainable use of marine resources by 2030.
- **Environmental Benefits:**
 - Mangroves and other vegetated ocean habitats sequester 25 percent of the extra CO₂ from fossil fuels, i.e., Blue Carbon.
 - Protection of coastal communities from disasters like floods and storms.
 - A Sustainable Blue Economy can help to achieve commitments under UN's Sustainable Development Goals 2030, Paris climate agreement 2015 and the UN Ocean Conference 2017
- **Renewable Energy:**
 - Sustainable marine energy can play a vital role in social and economic development.
 - As energy sources on the surface are limited, in the near future the dependency on marine resources will increase, which will require more human resource to be deployed in the field of environment engineering and marine resource protection
- **Mineral Wealth:**
 - According to ISA there are vast reserves of Poly-metallic Nodules, sulphides, cobalt rich ferro-manganese crust (rich in cobalt, bismuth, iron, lead, platinum).
 - ISA has notified two major areas "Clarion-Clipperton fracture zone" and Central Indian Ocean Basin.
 - India has already signed a contract and entered in the league with Japan, USA, China
- **Fisheries:**
 - Sustainable fisheries can generate more revenue, more fish and help restore fish stocks.
- **Maritime Transport:**
 - Over 80% of international goods traded are transported by sea.
 - Marine services sector could serve as the backbone of its blue economy and help India become 10 trillion dollar economy by 2022.
 - Indian Ocean is a major conduit of trade with as much as 80% of global oil trade happening through it.
- **Tourism:**
 - Ocean and coastal tourism can bring jobs and economic growth.
- **Climate Change and Bio-diversity:**
 - Oceans are an important carbon sink (blue carbon) and help mitigate climate change.
 - Oceans protect biodiversity, keep the planet cool, and absorb about 30% of global CO₂ emissions.
 - Oceans cover three-quarters of the Earth's surface, contain 97% of the Earth's water, and represent 99% of the living area on the planet.
- **Waste Management:**
 - Better waste management on land can help oceans recover.

Challenges associated:

- **Threat of sea borne terror:**
 - Piracy and armed robbery, maritime terrorism, illicit trade in crude oil, arms, drug and human trafficking and smuggling of contraband etc.

- **Natural Disasters:**
 - Every year tsunamis, cyclones, hurricanes typhoons etc leave thousands of people stranded and property worth millions destroyed.
- **Man-Made disasters:**
 - Oil spills, climate change continue to risk the stability of the maritime domain.
- **Impact of climate change:**
 - Threats of both slow-onset events like sea-level rise and more intense and frequent weather events like cyclones.
 - Long-term climate change impacts on ocean systems like changes in sea temperature, acidity, and major oceanic currents.
- **Marine pollution:**
 - In form of excess nutrients from untreated sewerage, agricultural runoff, and marine debris such as plastics.
 - Deep sea mining can cause long term irreversible ecological damage to marine ecosystem.
- **Geopolitical issues:**
 - Geopolitical tussle between in various regions like South China Sea, Indian Ocean Region etc. and undermining International Laws like UNCLOS limits the countries from achieving the full potential of Blue Economy.
- **Overexploitation of marine resources:**
 - Illegal, unreported, and unregulated extraction of marine resources.
 - FAO estimates that approximately 57 percent of fish stocks are fully exploited and another 30 percent are over-exploited, depleted, or recovering.
- **Unsustainable development near marine areas:**
 - Physical alterations and destruction of marine and coastal habitats & landscapes largely due to coastal development, deforestation, & mining

Way Forward:

- India should look to adopt the sustainable approach of balancing economic benefits with sustainability for meeting the broader goals of growth, employment generation, equity and protection of environment.
- We need to come up with technology to explore the minerals deep down at seabed.
- India must focus on **marine ICTs, and transport (shipping) and communication services**, and the **creation of a knowledge hub** for marine research and development.
- An **effective response mechanism to address humanitarian crises and natural disasters** should be made for the evolving Indian Ocean security strategy.
- India should not look at its oceans as just water bodies, but as global stage for continued economic, social, and cultural dialogue.
- Ever increasing marine pollution must be abated and India's vow to curb plastic pollution must be pursued relentlessly.
- Tackling the Global warming and submergence of low lying islands as part of Paris Climate deal agreement and initiatives like FIPIC.

Q) Designing a sustainable and inclusive transport systems in urban India is the need of the hour. Elucidate. (250 words)

[Livemint](#)

Why this question:

The article talks about Carpooling as an idea that needs regulatory intervention in India. Forcing us to think over the need to design a sustainable and inclusive transport systems in urban India.

Key demand of the question:

The answer must provide for detailed analysis of inclusive and sustainable urban transport system in India.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Discuss the context of the question briefly.

Body:

The answer must capture the following aspects –

First highlight the benefits of having such a system; Densification reduces mobility needs and enhances public transport. Large cities use public transport more, but lack non-motorized transport. The amount of transport increases with city size (by population). The household income is the single largest determinant of the amount of transport. Indian cities need investments in public and non-motorized transport infrastructures and disincentives of private modes.

Then discuss need for inclusive and sustainable urban transport, what needs to be done to achieve the same.

Suggest solutions ranging from carpooling, mass rapid transport system etc.

Conclusion:

Conclude with way forward.

Introduction:

- India is a country with the second largest road network in the world. Out of the total stretch of 5.4 million km of road network, almost 97,991 km is covered by national highways.
- Traffic congestion has increased dramatically in India. Congestion and the associated slow urban mobility can have a huge adverse impact on both the quality of life and the economy.

Body:

Problems faced by Urban Transport in India:

- **Unprecedented Transport Growth:** According to Niti Aayog, the number of registered motor vehicles has increased from 5.4 million in 1981, to 210 million in 2015. This rapid growth in demand in the absence of widespread public transport system has caused a rapid increase of private car ownership in India.
- **Inadequate Public Transport:** According to government data, there are about 19 lakh buses in the country and only 2.8 lakh of them are run either by state transport undertaking or under stage carriage permits.
- Further, a CSE study points out that the share of public transport is expected to decrease from 75.5% in 2000-01, to 44.7 per cent in 2030-31, while the share of personal transport will be more than 50%
- **Urban Pollution:** According to a WHO study 14 out of the top 15 most polluted cities in the world belong to India. Vehicular pollution has been one of the major contributors to rising urban air pollution in Indian cities along with other factors such as construction activity, road dust and industrial activity.
- **Urban Congestion:** Major Indian cities like Delhi, Mumbai, Kolkata and Bengaluru are ranked among world's most congested cities. For example: Average speed for vehicles in Bengaluru is reported as 17 km/h. These high levels of congestion have huge economic implications in the form of reduced productivity, fuel waste, and accidents. Further, there is an acute shortage of parking spaces both on and off the streets in the urban centres.
- **Road safety:** Traffic injuries and fatality: According to the Report 'Road Accidents in India-2016', road accidents in India have decreased by around 4.1% in 2016 from 2015. However, fatalities resulting from these accidents have risen by about 3.2%. The major reasons for traffic crashes include poor quality of roads, poor traffic management, unsafe and overcrowded vehicles and unsafe driving behaviour.
- **Equity Issues:** Unplanned urbanization in India has led to gentrification (as per upper and middle socio-economic class) of city centres and lower income groups are forced to live in peripheral suburbs which have increased their cost and time they allocate to commute. Most of the lower income groups and urban poor fail to afford private transport and even public transport are high for them. For example, a CSE study ranks Delhi Metro as the second most unaffordable metro (after Hanoi in Vietnam) with lower income group people spending nearly 22% of their monthly transport on Delhi Metro fares.
- **Mobility for women:** Safety or the lack thereof, is the single biggest factor constraining women's mobility. According to Action Aid UK, **79% of women in major Indian cities reported being harassed on streets.** Overcrowding in public transport adds to insecurity and safety issues with a large number of women complaining about harassment in public transport across major Indian cities like Delhi and Mumbai.

Measures needed:

- Any solution if expected to be successfully implemented will definitely require effort and planning on a huge scale. This is especially for when we are coming up with plans which can reach the entire country.

- **Corruption will have to be curbed**, and it will be extremely vital that the raw material is of the highest quality are used for the longevity and strength of the roads.
- **Road pricing system**: people should be charged based on the length of the road and the duration for which they use the road. This will be difficult to implement and will require huge technological investment to become possible.
- **Improvement in public transport** and additional schemes like BRT. The Bus Rapid Transport is implemented in some cities like Pune, and it can be very helpful if implemented correctly.
- People should **try and use carpooling and bike pooling** as much as possible. Use of bicycles for smaller distances also improves individual health along with reducing pollution and road congestion.
- **Strict and stringent measures against traffic violators**. A regulation in the traffic rules and fines levied for breaking them.
- **Metro** can play a huge role in improving the traffic issues to a great extent. If Nagpur metro becomes successful, it will pave the way for implementation in other cities as well which can be very beneficial.
- **Increase in the use of CNG and electric vehicles** and providing relief to those who use the same.
- **Well engineered, safe infrastructure** for travel should be ensured. Further, there is an urgent need to **address the issue of low woman mobility by ensuring women safety** through **gender-sensitive transport policies**, dedicated seats/ coaches and emergency helplines.
- There should be **focus on enhancing non-motorised transport**. Focus should be to encourage use of non-motorised transport for short distances. Further, Pedestrian zones, bike lanes should be made to ensure safety to commuters. For example, well designated Bike-lanes and bike-sharing solutions have promoted use of bicycles as a mean of transport in cities like Amsterdam and Paris.
- Commuters should be provided with **multiple modes of connectivity**. To ease out travelling, a single smart card can be provided. For example, London's Oyster "smart" card enables a commuter to change from one mode to another with minimal loss of time or effort.

Conclusion:

- It's time that city leaders and officers in India recognize the benefits of sustainable mobility and incorporate well-defined strategies and policies into their own public agendas.
- The future of their economies and their citizens depends on it.

Topic: Science and Technology- developments and their applications and effects in everyday life

Q) What do you understand by 5G technology? What are its benefits? Explain the various challenges involved in adopting the same. (250 words)

Reference

Economictimes

Why this question:

The question is in the backdrop of recent debates over the Huawei's role in the 5G network rollout in India continues. This comes at a time when the government has made its intentions clear to start with the 5G trials soon.

Key demand of the question:

Explain in detail the 5G technology, its benefits and applications and what are the challenges currently India is facing in implementing it.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Explain in brief what you understand by 5G technology.

Body:

Explain the following points –

5G – It is the next generation cellular technology that will provide faster and more reliable communication with ultra-low latency.

Its benefits – It will revolutionize the mobile experience; consumers will be able to download data heavy content such as 8K movies and games with better graphics in just a few seconds. But once 5G

becomes commercial, users will be required to change their current devices in favor of 5G-enabled ones.

However, it is likely that the primary use of the technology will go beyond delivery of services on personal mobiles devices.

Discuss the various fields of applications for such technology.

Discuss the various challenges being faced in incorporating the technology in India.

Conclusion:

Conclude by reasserting the significance of such a technology.

Introduction:

- 5G is **the fifth generation mobile network**. It's a unified platform which is much more capable than previous mobile services with more capacity, lower latency, faster data delivery rate and better utilisation of spectrum. The standards for the usage of 5G are defined and driven by 3rd Generation Partnership Project (3GPP).

Body:

Characteristics of 5G technology:

The potential advantages it offers:

- Industry 4.0:**
 - The manufacturing industry is going through a digital revolution.
 - Within the context of Industry 4.0, manufacturers are becoming more efficient through the application of automation and data exchange to their existing factory processes to enable better integrated workflows and smarter manufacturing.
 - Industrial IoT technologies are streamlining and simplifying many manufacturing processes in revolutionary ways.
- Mixed reality (MR) applications:**
 - The MR Apps comprise **augmented reality (AR) plus virtual reality (VR) apps**.
 - Beyond the consumer market (think Pokémon Go), interesting applications are also likely to be found in **industrial and medical contexts**.
 - Remote medical procedures, engineering, public safety and field-service applications are all strong use case opportunities for the application of low latency 5G services.
- Sports and entertainment:**
 - A combination of VR and AR with ultra high-fidelity enabled by 5G could transform the way fans interact in these events.

- Motorsports is ideal for VR in particular: equipped with their mobile device or headset, fans could be served information like lap or technical information about cars as they race on the track in a sport like Formula 1

- **Fixed wireless access:**
 - Fixed wireless access could also be used to bring high bandwidth digital services to under-served rural areas.
 - Mobile operators will then be able to compete with wireline, satellite and cable companies, offering new revenue streams and faster RoI.
- **Autonomous vehicles:**
 - The idea that much of the car, if not all of it, is controlled not by the driver but by technology.
 - 5G is critical to realize this as it will offer the connectivity and speed needed to deliver vast amounts of data to one another as well as other objects simultaneously.
 - 5G can provide a completely seamless mobile experience is a must so that cars can stay constantly connected.

Challenges present to adapt to 5G are:

- **Frequency allocation:** Indian operators have **far less spectrum** in comparison to international operators. The **high investment cost** which makes telecom companies unsure about Return on Investment.
- **Network investment:** In India, the telecom sector is **facing capital augmentation issues** which need to be resolved.
- **Non-availability of funds for investment:** Many of the Indian operators are also **weighed down by debt**.
- **Regulatory restrictions:** Faster rounds of new technology introduction when prior technology investments have not been recouped add further complexity.
- **Technical Challenges:** Designing IT architecture that can be deployed globally, while still allowing for localized technology to cater for different regions is a challenge.

Way forward for India:

- Need to align Digital India with 5G technology.
- Incentivize design and manufacture of 5G technologies, products and solutions in India.
- Allocate funds and incentivise local technology and telecom firms to develop their internal capacities which would in turn help 5G technology succeed in the country
- Promote 5G start-ups that enable this design and manufacturing capabilities.
- Promote generation of IPR backing the above designs.
- Manufacture of 5G chipsets, this may require massive investments.
- Appropriate test-beds and technology platforms to enable and help Indian technical ecosystem to have an edge in 5G.
- Accelerated deployment of next generation ubiquitous ultra-high broadband infrastructure with 100% coverage of 10 Gbps across urban India and 1 Gbps across Rural India.

- Coverage, reliability, and scalability must be optimized and seamless mobile networks will require a unified management policy to ensure consistent standards

Conclusion:

- The **World Economic Forum** predicts that by 2023 there will be a staggering 9.1 billion mobile subscriptions.
- 5G will act as the catalyst for Digital India—a watershed moment in digital transformation.
- India is at the cusp of a next generation of wireless technology 5G. It provides an opportunity for industry to reach out to global markets, and consumers to gain with the economies of scale. It can help in better service delivery, faster access to services and deeper penetration of digital services.

Q) Discuss India's achievements in the field of Space and Technology. How far has the application of this technology helped India in its socio-economic development? Explain. (250 words)

Reference

Why this question:

India successfully launched its second moon mission Chandrayaan-2 recently from its most powerful rocket with a plan to land the rover on the unexplored lunar south pole.

Key demand of the question:

The answer must discuss in detail India's achievements in the field of Space and Technology and in what way it has impacted the socio-economic development of the country.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

write a few introductory lines about the recent achievements made by the Indian space agencies.

Body:

Discuss in detail how ISRO has achieved numerous milestones lately and has proved to harness space technology for national development. Relate how these achievements have direct link on the socio-economic development of the country.

Conclusion:

Conclude by reasserting significance of the same.

Introduction:

- India is one of the front runners in space technology. It has been hailed as one the most successful programmes. From India's first satellite Aryabhata (1975) to the development of indigenous cryogenic engine India has made significant advances with little help and no technology sharing from developed countries.
- With the multi dimensional applications space technology ensures, India is moving in the right direction.

Body:

Over the last few years, the Indian Space Research Organisation (ISRO) took giant leaps forward, one success after the other.

- **Chandrayaan 2:** India successfully launched its second lunar mission Chandrayaan-2 a week after it halted the scheduled blast-off due to a technical snag. India hopes the \$145m (£116m) mission will be the first to land on the Moon's South Pole.
- **INSAT:** The system is a network of satellites that facilitates **communication and broadcasting** across the south Asian region. It ushered in a revolution in India's television and radio broadcasting, telecommunications and meteorological sector.
- Created **Polarized Satellite Launch Vehicle (PSLV)** to make cost effective launch system. This has also increased international space collaboration by launching satellites of other nations at low costs.
- **Chandrayaan 1:** It has launched Chandrayaan 1 lunar probe mission in 2008.
- **Mangalyan:** ISRO has launched **Mars Orbiter Mission** in 2013 and created history by launching Mangalyan (mission spacecraft) into the Mars orbit in maiden attempt.
- **ASTROSAT:** It has launched first space observatory in 2015 to become fourth agency to do so after NASA, Roscosmos and ESA.

- **Scramjet:** Supersonic Combusting Ramjet has been launched by ISRO. This system works on Air-breathing Propulsion System which uses atmospheric oxygen to burn the fuel in the rocket.
- **RLV-TD:** ISRO demonstrated its **Reusable Launch vehicle** space shuttle RLV -TD to launch satellites around earth orbit and re-enter into the atmosphere.
- **104 satellites:** ISRO has created history by launching 104 satellites in one go.
- **Crew Escape module:** ISRO has test-launched Crew Escape Module paving the way for manned space mission Gaganyaan.

Besides, **NAVIC** (Indian Regional navigation satellites system) and **South Asia Satellite** are other missions which are a remarkable example of international coordination in the space arena. ISRO is preparing for its missions of **Aditya (Solar Mission)** and **Gaganyaan (Manned Space Mission)**.

Contributions to Socio-Economic Development:

- Acreage and production estimates for the principal crops such as wheat, rice, sorghum, cotton, mustard, and groundnut using Forecasting Agriculture Output using Space Agrometeorology and land based observations (FASAL). **Precision farming using IRNSS. Agro Metrological (AGROMET) Towers** to measure soil temperature, soil moisture, soil heat and net radiation, wind speed, wind direction, pressure and humidity.
- **Wasteland mapping, watershed development and monitoring as well as help in fisheries sector for augmentation of income.**
- **Survey of various mineral and natural resources** have been made possible through remote sensing.
- Management of these resources, their development conservation and formulation of various policies are affectively done with the use of information derived through remote sensing.
- It plays a vital role in **delivering cyclone warnings** and is used in search and rescue operations. Various meteorological services including information about monsoon, climate flood, cyclonic activities etc are provided through the technologies.
- It has developed **communication technology** in India.
- They have proved very useful in **spread of education**. Even in remote areas, the expertise educations have been made possible through the talk back channels of INSAT-3D satellite.
- They have helped in **environment conservation programmes** estimation of agricultural production and water resources information's.
- **Introducing telemedicine** via satellite for making speciality treatment accessible to people in remote areas of India. Places around Bangalore, Kolkata and Tripura are networked with a hub using VSAT terminals.
- The concept of "Gramsat" satellites have emerged to provide the basic requirements of villages.
- **Village Resource Centers** located at coastal tracts are being provided with near real time information on satellite derived Potential Fishing Zones (PFZ). Information pertaining to inland fisheries, aquaculture, etc., is also provided through VRCs as relevant.
- Another application of satellite communication is **Satellite Aided Search and Rescue (SAS&R)**, as a part of India's commitment to the International COSPAS- SARSAT programme for providing alerts and position location services for aircraft and ships in distress.
- Commercialization of space launching technologies by **ANTRIX** has resulted into economic gain.
- Apart from these various uses, the space programme has helped in social cultural and scientific consolidation and harmony.

Conclusion:

- Over the last four and half decades, the Indian space programme has made impressive progress through well integrated, self-reliant programs.
- Through its space technology programme, India is promoting a knowledge based society which has led to social, economic and political transformation.

Topic: Awareness in the fields of IT, Space, Computers, robotics, nanotechnology, biotechnology and issues relating to intellectual property rights.

Q) The utility of the DNA Technology (Use and Application) Regulation Bill could be of enormous abet in many areas yet bereft of safeguards. Critically analyse. (250 words)

Reference

Why this question:

The Lok Sabha has passed the DNA Technology (Use and Application) Regulation Bill, 2018 that allows regulated use of DNA technology to establish the identity of certain defined categories of persons, including offenders, suspects, and undertrials.

Key demand of the question:

The answer must explain the advantages and concerns associated with the bill.

Directive:

Critically analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with brief highlights of the bill.

Body:

Discussion should include the following:

Explain what was the need for such a legislation and what is its significance.

Bring out the key features of the bill and analyse both pros and cons.

Explain the benefits such as – By providing for the mandatory accreditation and regulation of DNA laboratories, the Bill seeks to ensure that with the proposed expanded use of this technology in the country. There is also the assurance that the DNA test results are reliable and the data remain protected from misuse or abuse in terms of the privacy rights of our citizens.

Then explain the associated concerns.

Conclusion:

Conclude with need for a balanced vision towards such aspects.

Introduction:

- With DNA technology being relied upon worldwide in crime investigations, identification of unclaimed bodies, or determining parentage, India has been attempting for several years to pass legislation on use of DNA technology to support and strengthen the justice delivery system.

Body:

Key Highlights of Proposed Bill

- **Purpose:**
 - It allows law enforcement agencies to collect DNA samples, create DNA profiles and special databanks for forensic-criminal investigations. It states that all DNA data, including DNA samples, DNA profiles and records, will be only used for identification of the person and not for any other purpose.
- **DNA profiling board:**
 - It creates DNA Profiling Board (DPB) that will be final authority that will authorise creation of State-level DNA databanks, approve the methods of collection and analysis of DNA-technologies. It makes accreditation and regulation mandatory for DNA laboratories.
- **DNA banks:**
 - It allows government to set up DNA data banks across India to store profiles. These banks will maintain national database for identification of victims, accused, suspects, undertrials, missing persons and unidentified human remains.
- **Penalty:**
 - It also empowers government to impose jail term of up to 3 years and fine of up to Rs. 1 lakh on those who leak information stored in such facilities. It prescribes similar punishment for those who seek information on DNA profiles illegally.
- **Use of DNA Data:**
 - Under the Bill, DNA testing is allowed only in respect of matters listed in the schedule to the Bill (such as, for offences under the Indian Penal Code, 1860, for paternity suits, or to identify abandoned children).
- **DNA Data Bank:**
 - The Bill provides for the establishment of a National DNA Data Bank and regional DNA Data Banks, for every state, or two or more states.
 - The National Data Bank will store DNA profiles received from DNA laboratories and receive DNA data from the regional Banks.

- Every Data Bank will be required to maintain indices for the following categories of data: (i) a crime scene index, (ii) a suspects' or undertrials' index, (iii) an offenders' index, (iv) a missing persons' index, and (v) an unknown deceased persons' index.
- **Protection of information:**
 - It also ensures that the data remain protected from misuse or abuse in terms of the privacy rights of citizens.
 - Under the Bill, the Board is required to ensure that all information relating to DNA profiles with the Data Banks, laboratories and other persons are kept confidential. DNA data may only be used for identification of the person.
 - However, the Bill allows for access to information in the Data Bank for the purpose of a one-time keyboard search. This search allows for information from a DNA sample to be compared with information in the index without information from the sample being included in the index.
- **Retention of DNA Data:**
 - The Bill states that the criteria for entry, retention or removal of the DNA profile will be specified by regulations.
 - However, the Bill provides for removal of the DNA Data of the following persons:- (i) of a suspect if a police report is filed or court order given, (ii) of an undertrial if a court order is given, (iii) on request, of persons who are not a suspect, offender or undertrial from the crime scene or missing persons' index.
 - Further, the Bill provides that information contained in the crime scene index will be retained.
- **DNA Laboratories:**
 - Any laboratory undertaking DNA testing is required to obtain accreditation from the Board. The Board may revoke the accreditation for reasons including, failure to: (i) undertake DNA testing, or (ii) comply with the conditions attached to the accreditation. If the accreditation is revoked, an appeal will lie before the central government or any other authority notified by the central government.
- **Obligations of DNA Laboratories:**
 - Under the Bill, every DNA laboratory is required to perform various functions, including: (i) following standards for quality assurance in collection, storing, testing, and analysis of DNA samples, and (ii) depositing DNA samples with the Data Bank.
 - After depositing the sample for ongoing cases, the Laboratory is required to return the biological sample to the investigating officer. In all other cases, the sample must be destroyed and intimated to the concerned persons

Challenges with the bill:

- The draft statute, not only disregards the serious ethical dilemmas that are attached to the creation of a national DNA database, but also, contrary to established wisdom, virtually treats DNA as infallible, and as a solution to the many problems that ail the criminal justice system.
- This Bill fatally ignores the disproportionality of the DNA bank that it seeks to create, and the invasiveness of its purport and reach.
- It also conflates its objectives by allowing the collection of DNA evidence not only in aid of criminal investigations but also to aid the determination of civil disputes.
- Importantly, while consent is not required before bodily substances are drawn from a person accused and arrested for an offence punishable with either death or imprisonment for a term exceeding seven years, in all other cases a person refusing to part with genetic material can be compelled to do so if a Magistrate has reasonable cause to believe that such evidence would help establish a person's guilt. Therefore, there's no end to the state's power in coercing a person to part with her DNA.
- In Justice K.S. Puttaswamy (Retd) v. Union of India declared that the Constitution recognizes a fundamental Right to Privacy. But, it is unclear whether the proposed bill is compatible with the Right to Privacy or not.
- The Bill's failure to place sufficient checks on the use of DNA evidence collected in breach of the law makes the process altogether more frightening.
- The Schedule lists civil matters where DNA profiling can be used. This includes "issues relating to the establishment of individual identity." DNA testing carried out in medical or research laboratories can be used to identify an individual. It is unclear if the Bill intends to regulate such laboratories.
- The Bill requires the consent of the individual when DNA profiling is used in criminal investigations and identifying missing persons. However, consent requirements have not been specified in the case of DNA profiling for civil matters.

- DNA laboratories are required to share DNA data with the Data Banks. It is unclear whether DNA profiles for civil matters will also be stored in the Data Banks. Storage of these profiles in the Data Banks may violate the right to privacy.
- DNA laboratories prepare DNA profiles and then share them with DNA Data Banks. The Bill specifies the process by which DNA profiles may be removed from the Data Banks. However, the Bill does not require DNA laboratories to remove DNA profiles. It may be argued that such provisions be included in the Bill and not left to regulations.

Way Forward:

- DNA profiling should be undertaken exclusively for the identification of a person and should not be used to extract any other information.
- The state must show that there exists a legitimate reason for extracting DNA evidence and that the extent and scope of such extraction do not disproportionately contravene a person's right to privacy.
- To enact the law in its present form would only add a new, menacing weapon to the state's rapidly expanding surveillance mechanism. The government should not allow the benefits of science and technology to be privileged over the grave risks in allowing the unrestricted access to deeply personal material.
- Maintenance of strict confidentiality with regard to the keeping of records of DNA profiles and their use should be considered a priority.

Q) Do you agree instituting a framework which would enable full utilization of new ideas and innovation towards achieving self-reliance in defence sector is the need of the hour? Discuss the key features of Mission Raksha Gyan Shakti (MRGS) aimed in this direction. (250 words)

Reference

Why this question:

In a major boost to Mission Raksha Gyan Shakti, a MOU was signed between the Intellectual Property Facilitation Cell (IPFC), Department of Defense Production, Ministry of Defense and National Research Development Corporation (NRDC), Ministry of Science and Technology.

Key demand of the question:

The question intends to analyse the importance of instituting a framework which enables full utilization of new ideas and innovation towards achieving self-reliance in defense sector.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief discuss the significance of intellectual property rights and their importance for Defense sector.

Body:

Discussion should have the following aspects:

Key features of Mission Raksha Gyan Shakti- it was launched with the aim to inculcate IP culture in Indian defense manufacturing ecosystem.

Explain the significance of IPR in defense domain and in what way it helps in achieving self-reliance.

Conclusion:

Conclude with way forward.

Introduction:

- The Department of Defence Production had instituted a framework titled 'Mission Raksha Gyan Shakti' which aims to provide a boost to the Intellectual Property Rights culture in indigenous defence industry.
- In a major boost to Mission Raksha Gyan Shakti, a MOU was signed between the Intellectual Property Facilitation Cell (IPFC), Department of Defence Production, Ministry of Defence and National Research Development Corporation (NRDC), Ministry of Science and Technology.

Body:

Key features of MRGS:

- As part of the ongoing initiatives to enhance self-reliance in defence, the Mission Raksha Gyan Shakti aims to provide a boost to the IPR culture in indigenous defence industry.

- It aims to achieve the goal of self-reliance in defence sector to generate Intellectual Property in India and marks a departure from the culture of seeking Transfer of Technology (ToT) from foreign sources.
- Design or IP accounts for over 50% of the cost. In some cases it is 70-80%. Indigenisation can result in cost savings of about 50-70%.
- To achieve ambitious targets of training 10,000 personnel of Ordnance Factories (OFs) and Defence Public Sector Undertakings (DPSUs) on IPR.
- To facilitate filing of at least 1,000 new IPR applications.
- The Directorate General of Quality Assurance (DGQA) has been entrusted with the responsibility of coordinating and implementing the programme.

Need for framework to achieve self-reliance:

- The IPR has emerged as a key ingredient of an ecosystem which stimulates innovation and ingenuity.
- Our knowledge and creativity have often not been utilized to its full potential due to lack of awareness on modern legal framework for protection of IP rights so it is need of the time to aware about IPR (Intellectual Property Rights).
- India has accumulated several technologies gained through Transfer of technology (ToT) agreements but for any design adjustments in the platforms, the original manufacturer has to be consulted.
- Further, it helps in safeguarding the national security secrets.
- India is the second largest arms importer in the world. It helps reduce the national spending on imports of arms and defence technology.
- It would also help earn some forex by selling the indigenously designed and developed defence equipments.
- India's aim to generate 2-3 million additional jobs in manufacturing industry and a boost to MSMEs can be achieved.

Measures needed:

- To boost indigenization, DRDO needs to be given more autonomy like space and atomic energy departments
- With opening up of 100% FDI in defence sector, giving private players an opportunity would bring in the money as well as competition to the Defence PSUs.
- Setting up of the planned defence industrial corridors.
- Robust Defence Diplomacy, for which a cadre of defence diplomats should be created so that new co-ordination with world can bring new idea and innovations.
- Setting up of a Defence Export Organization to promote export of defence equipments.
- Instituting an Independent Audit addressing issues of inefficiency and accountability, this shall help in keeping the flow of ideas and innovation.
- Setting up an aerospace university, can help in bringing new ideas and innovations

Conclusion:

- With recent trends such as globalization, emergence of new technologies, and emerging economies have elevated the importance of IPR protection, both politically and commercially, and has become a global commerce issue.
- IPRs are critical to incentivizing innovation, which, in turn, is key to sustaining economic growth and increasing living standards. IPRs in defence sector will give a natural advantage to a nation. MRGS is a step in the right direction.

Q) Chandrayaan 2 is yet another audacious attempt being made by ISRO in the field of space research. Examine the distinctiveness and significance of such a mission. (250 words)

Livemint

Why this question:

The question is to evaluate the distinctness and significance of Chandrayaan 2 mission.

Key demand of the question:

The answer must discuss in detail the objectives of the mission and what factors make it significant for India.

Directive:

Examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Start with the fact that Chandrayaan-2 is all set for 3.84 lakh km voyage.

Body:

Chandrayaan-2, which is the first Indian moon landing mission, is all set to head on its 3.84 lakh km voyage to the moon in the early hours of Monday, July 15, 2019.

The Indian Space Research Organization (ISRO) has scheduled the launch of its lunar probe, by a GSLV MkIII rocket, from the country's Sriharikota spaceport for 2.51 a.m.

A sequel to Chandrayaan-1, which was launched in 2008 and only orbited the moon at a distance of 100 km, Chandrayaan-2 entails the first attempt by any nation to make a landing on the moon's mineral rich south pole.

Explain that If ISRO achieves the feat in its first attempt, it will make India only the fourth country to soft-land on the lunar surface.

Conclusion:

Conclude by reasserting its significance.

Introduction:

- Chandrayaan-2 is India's second lunar exploration mission after Chandrayaan-1, developed by the **Indian Space Research Organisation**. It involves the three modules: the Orbiter, Lander (Vikram) and Rover (Pragyan) to conduct various scientific experiments on lunar surface.

Body:

Objectives of the mission:

- Push the **boundaries of scientific knowledge to unravel the mysteries of this universe**.
- Unleash innovation by throwing challenges at the youth of the country, and **spurring future research and development**.
- Explore economic possibilities by **strengthening ISRO's alliance** with the industry.
- Engaging with the general public by motivating the youth to undertake real life applications of science and technology.
- Expanding **India's footprint in space** as Moon is the perfect test-bed for proving technologies required for future space explorations.
- Making India a **key contributor of exploring and uncovering secrets of the universe**, thus **fostering shared aspirations** of the international community.

Distinctiveness of Chandrayaan 2:

- Technologically, it will be the most challenging mission that the Indian Space Research Organisation (ISRO) has undertaken because ISRO will not only be sending a spacecraft to the moon but attempting to soft-land a contraption called the lander on the lunar surface.
- If successful, India will be the fourth country (After Russia, China, and the USA) to land a rover on the moon.
- India will be the first country to land on the southern pole of the moon.
- This would give ISRO opportunity to name that site on the moon.
- Mission will also expand the country's footprint in space as moon is the perfect test-bed for proving technologies required for future space exploration.

Significance of the mission:

- It is India's second mission to the moon.
- It aims to explore the **Moon's south polar region**.
- It will be launched onboard India's most powerful launcher – **GSLV MK-III**.
- The mission is an important step in India's plans for planetary exploration, a program known as **Planetary Science and Exploration (PLANEX)**.
- There are three components of the mission, an orbiter, a lander and a rover.
- The mission payloads include — Terrain Mapping Camera which will generate a Digital Elevation Model (DEM) of the entire moon, Chandrayaan 2 Large Area Soft X-ray Spectrometer which will test the elemental composition of the Moon's surface Solar X-Ray Monitor which will provide solar X-ray spectrum inputs for CLASS.
- The orbiter will be deployed at an altitude of 100 kilometers above the surface of the Moon. The lander will then separate from the orbiter, and execute a soft landing on the surface of the Moon, unlike the previous mission which crash landed near the lunar south pole.

- The lander, rover and orbiter will perform mineralogical and elemental studies of the lunar surface. The rover is named **Pragyan**.
- The mission's lander is named **Vikram** after Dr Vikram A Sarabhai, the Father of the Indian Space Programme.
- 13 instruments from India, one instrument from US space agency, NASA.
- ISRO highlighted that the mission was supported by more than 500 academic institutions and 120 industries that contributed 60% of the Rs.603 crore cost of Chandrayaan-2 and 80% of the Rs.375 crore cost of the Geosynchronous Launch Vehicle-Mark III.
- The mission will also provide a map of the moon's topology, which could add many new findings to existing data due to its unique choice of the landing site.

Challenges involved in the moon landing:

- identifying trajectory accurately;
- taking up deep space communication;
- trans-lunar injection;
- orbiting around the moon;
- taking up soft landing on the moon surface;
- facing extreme temperatures and vacuum.

Conclusion:

- Based on the **new landing-profile**, the mission has further changes and new problems, with mission engineers working overtime to ensure timely launch.
- With the scientific mission riding on Chandrayaan-2, a successful landing near the south pole in itself would be an extraordinary feat for ISRO as well as global space exploration agencies.

Q) India's own manned space mission, Gaganyaan, is scheduled to be launched by 2022. In this light, discuss the achievements of previous global space missions. What are the possible spin-offs for India through Gaganyaan. (250 words)

[Indianexpress](https://www.indianexpress.com)

[Indianexpress](https://www.indianexpress.com)

Introduction:

- July 20, 2019 marked the fiftieth anniversary of man's first landing on the Moon, "a giant leap for mankind", as Neil Armstrong described it. Armstrong and Buzz Aldrin were taken to the Moon by the Apollo-11 mission in 1969. They were the first of the six two-astronaut teams that landed on the Moon over the next three years.
- The moon mission holds significance for India as she prepares for her **first manned space mission – Mission Gaganyaan**. It is being launched by Indian Space Research Organisation (ISRO) by 2022. The programme will make India the fourth nation in the world to launch a Human Spaceflight Mission. So far, only the USA, Russia and China have launched human spaceflight missions.

Body:

Achievements of previous global space missions:

| date accomplished | event | details | country or agency |
|-------------------|--|----------------------------------|-------------------|
| Oct. 4, 1957 | first artificial Earth satellite | Sputnik 1 | U.S.S.R. |
| Nov. 3, 1957 | first animal launched into space | dog Laika aboard Sputnik 2 | U.S.S.R. |
| Sept. 14, 1959 | first spacecraft to hard-land on another celestial object (the Moon) | Luna 2 | U.S.S.R. |
| April 1, 1960 | first applications satellite launched | TIROS 1 (weather observation) | U.S. |
| April 12, 1961 | first human to orbit Earth | Yury Gagarin on Vostok 1 | U.S.S.R. |
| June 16, 1963 | first woman in space | Valentina Tereshkova on Vostok 6 | U.S.S.R. |
| March 18, 1965 | first space walk | Aleksey Leonov on Voskhod 2 | U.S.S.R. |

| date accomplished | event | details | country or agency |
|-------------------|---|---|--|
| July 20, 1969 | first human to walk on the Moon | Neil Armstrong on Apollo 11 | U.S. |
| April 19, 1971 | first space station launched | Salyut 1 | U.S.S.R. |
| Dec 3, 1973 | first spacecraft to fly by Jupiter | Pioneer 10 | U.S. |
| April 25, 1990 | first large optical space telescope launched | Hubble Space Telescope | U.S., European Space Agency |
| June 21, 2004 | first privately funded manned spacecraft to achieve suborbital flight above 100 km (62 miles) | Mike Melvill on SpaceShipOne | Mojave Aerospace Ventures (commercial joint venture) |
| July 1, 2004 | first spacecraft to orbit Saturn | Cassini-Huygens | U.S., European Space Agency, Italy |
| Jan. 14, 2005 | first spacecraft to land on the moon of a planet other than Earth (Saturn's moon Titan) | Huygens probe of the Cassini-Huygens spacecraft | U.S., European Space Agency, Italy |
| June 13, 2010 | first spacecraft to return to Earth with samples from an asteroid | Hayabusa | Japan |
| March 17, 2011 | first spacecraft to orbit Mercury | Messenger | U.S. |

Spin-off benefits of ISRO's space programs:

- **Distress Alert Transmitter (DAT)**
 - INSAT based Distress Alert Transmitter (DAT) is used to transmit emergency conditions and for rescue operation. It can be easily installed in boats or other vehicles. Intended for emergency message communication transmission for all type of sea going vessels especially useful for fisherman.
- **Artificial Polyurethane Foot**
 - Polyurethane (PU) technology was developed for insulation, damping, acoustic protection and other lightweight structural applications in launch vehicles. The development of PU foams for rocket motor applications has resulted in an important spin off in the form of artificial foot prosthesis. Amputees especially among the poor and needy in the country will benefit from free prostheses replacement.
- **Fire Extinguishing Powders**
 - One of the widely used ISRO products is the fire extinguishing powder – 'OLFEX' for flammable liquid, gas fires and Ternary Eutectic Chloride (TEC) powder for metal fires. OLFEX is a reaction product of urea and potassium bicarbonate and is used for extinguishing oil fires.
- **Automatic Weather Station**
 - The state of the art Automatic Weather Station (AWS) developed by ISRO is designed as a very compact, modular, rugged, powerful, low cost system and housed in a portable, self contained package. The AWS can immediately provide information on weather and an anomaly from normal/expected weather.
- **Silica Cloth (ISROSIL)**
 - ISRO developed High Silica Cloth – ISROSIL is being used by industries for insulation and thermal protection for non metallic bellows, wrapping for pipes, cables and hoses, vertical strip furnace curtains, seals and gaskets etc.
- **DTH Based Disaster Warning system (DWS)**
 - ISRO developed a DTH based Disaster Warning Dissemination System which will find wide applications for disaster warning dissemination during flood, earthquake, tsunami, cyclone, landslides, civil disturbances etc. Function(s) of each warning receiver deployed at different places can be controlled from transmit end. The system can disseminate data Direct to Home (DTH) or to community centres and public places.

- **Pedclean**

- ISRO developed a hand cleansing formulation, PEDCLEAN-A. This cleansing system was very useful for industrial and laboratory personnel working with polymers, adhesives, oils and greases and other materials which are sticky in nature. PEDCLEAN was evaluated and certified by Industrial Toxicological Research Institute, Lucknow who certified it safe for human use as a skin barrier cream.

Conclusion:

- Space research always has been fascinating and India has not lagged behind. Future challenges related to space exploration, space travel, tourism application programmes based on space assets spin off technology benefits etc are going to provide lot of opportunity to the new generation.

Q) Do you agree that the country must deregulate the space sector to encourage private enterprise so as to compete in the new space economy ? Analyse. (250 words)

[Livemint](#)

Why this question:

The article throws light upon space as an emerging economy and the rising strides of competition.

Key demand of the question:

The answer must focus on importance of deregulating the space sector and allowing the private sector to play key role in contributing to the space economy.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Discuss the background of the question.

Body:

Explain how private sector carries with it huge potential to propel the space economy, How has the role of the private sector evolved over the years? Quote the example of SpaceX and with these changing trends how have the regulatory framework shaping up etc.

Take cues from the article and form a structured answer.

Conclusion:

Conclude by reasserting importance of the space economy and role of deregulation of the sector.

Introduction:

- India has been achieving great feats in the space arena ranging from Mangalyaan to launching 104 satellites at one go to the recent Chandrayaan 2 mission.
- However, it is ironic that India—whose space-faring tradition is decidedly in the service of human development—is lagging in harnessing the power of private innovation in the space domain. This not only limits the exploitation of space for economic development, but has serious national security implications.

Body:

India's space program

Potential advantages of rising Space industry:

- Adding an edge to India's foreign policy as our space capabilities can be a part of our initiatives to foster new relationships,
- Avoiding the outflow of tax-payer's money to foreign hands from where we procure turnkey products and services,
- Creating more opportunities for foreign direct investments (FDI), as well as new jobs for highly-skilled labour market,
- Empowering India's defence system by equipping it with space technology, and allowing armed forces to procure defence products and services indigenously, and
- Reversing the brain-drain from India.

Challenges for private space entities in India:

- **Monopoly:** In India 'Space' means Indian Space Research Organisation. Globally the technology is highly protected because of its dual use capability. Even if it was not, it would be prohibitively expensive.
- **Funding:** A major challenge in setting up a space business in India is funding. Space industry is capital intensive and upstream activities come with a long gestation period.

- **Investor's Dilemma:** The lack of clarity among the investors and lack of the ecosystem required for significant contribution is a challenge for the investors.
- **Lack of Regulation:** India is a party to the **Outer Space Treaty**, where one of the fundamental requirements laid upon states is the supervision of space activities within its borders, the country did not have any formally legislated laws. This is a potential roadblock for commercialization.
- **Growth Challenges:** Scaling up, international marketing and funding are challenges.
- **Lack of Support:** the Indian ecosystem has neither incubation support nor pointers to seek support of leaders such as ISRO for space start-ups.
- **Political and bureaucratic hurdles** limit private space operations in India.
- Low in-house capacity of ISRO restricts them to very few launches in a year. Privatization can offload 30-40% of the work and help them work more efficiently.

Way forward:

- India should have **national space activities legislation** which takes on board all stakeholders.
- A **public-private partnership (PPP) model** can be looked into to realise ISRO's workhorse Polar Satellite Launch Vehicle (PSLV), with a joint venture between ISRO and the private sector.
- In the UK, space ventures are treated as a complement to big organizations and not a competitor. This should be encouraged in India too.
- A **supportive international partner and likeminded local partners** helps to set up a space business.
- The idea should be to let the private industry build their own facilities after gaining enough expertise.
- ISRO has built a space technology park spread over 25 acres in Bengaluru where the entire range of facilities have been set up for use by the industry.

Conclusion:

- The private sector already supplies majority of the sub-systems in satellite manufacturing. This can be further scaled up into other activities with proper regulation and partnership of the ISRO and private sector.
- The country must deregulate the space sector to encourage private enterprise if we are to compete in the new space economy

Q) Enumerate the different missions launched for exploration of Moon by various space organisations. What are the challenges associated with long plight missions ? How ISRO's Chandrayaan-2 is different from other similar missions launched by different countries ? (250 words)

The hindu

Introduction:

- India successfully launched its second lunar mission Chandrayaan-2 a week after it halted the scheduled blast-off due to a technical snag.
- India hopes the \$145m (£116m) mission will be the first to land on the Moon's south pole. If successful, India will become the fourth country to make a soft landing on the Moon's surface. Only the former Soviet Union, the US and China have been able to do so.

Body:

Various global missions for exploration of moon:

- **Luna Programme:** It was a series of unmanned space mission of the Soviet Union sent to the Moon between 1959 and 1976. It was designed as either an orbiter or lander and accomplished many firsts in space exploration.
- **Project Apollo:** It was a series of human spaceflight missions undertaken by the United States of America using the Apollo spacecraft and Saturn launched vehicle conducted between 1961-1972. It was the third US human spaceflight program to fly, preceded by the two-man Project Gemini conceived in 1961 to extend spaceflight

Sites of successful Moon landings

Source: NASA

BBC

capability in support of Apollo. The crew of first space expedition of this mission was Neil Armstrong, Michael Collins and Buzz Aldrin. Armstrong and Aldrin walked on the lunar surface while Collins remained in orbit around the moon. Neil Armstrong was the first person to walk on the moon.

- **Chandrayaan 1:** It was India's first lunar probe launched by the Indian Space Research Organisation in October 2008, and operated until August 2009. The prime objective was to conduct scientific experiments using instruments on the spacecraft which would yield data.
- Landing on moon's far side: In January 2019, China's **Chang'e 4** became the first spacecraft to land on the far side of the moon
- Google also entered the fray with a competition – **Lunar XPRIZE** – to facilitate affordable access to the moon and help space entrepreneurs to develop long-term business models on lunar transportation.

Challenges associated with long flight missions:

- identifying trajectory accurately;
- taking up deep space communication;
- trans-lunar injection;
- orbiting around the moon;
- taking up soft landing on the moon surface;
- Facing extreme temperatures and vacuum.

Distinctiveness of Chandrayaan 2:

- Technologically, it will be the most challenging mission that the Indian Space Research Organisation (ISRO) has undertaken because ISRO will not only be sending a spacecraft to the moon but attempting to soft-land a contraption called the lander on the lunar surface.
- If successful, India will be the fourth country (After Russia, China, and the USA) to land a rover on the moon.
- India will be the first country to land on the southern pole of the moon.
- This would give ISRO opportunity to name that site on the moon.
- Mission will also expand the country's footprint in space as moon is the perfect test-bed for proving technologies required for future space exploration.

Conclusion:

- Based on the **new landing-profile**, the Chandrayaan-2 mission has further changes and new problems, with mission engineers working overtime to ensure timely launch.
- With the scientific mission riding on Chandrayaan-2, a successful landing near the south pole in itself would be an extraordinary feat for ISRO as well as global space exploration agencies.

Topic: Conservation, environmental pollution and degradation, environmental impact assessment,

Q) "Assertion of environmental citizenship by the people of India is the need of the hour". Analyse the statement with suitable examples. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article discusses in detail the Hindu Vedic principle of Rta dharma – Sanskrit for "truth" or "order". It highlights the religious thoughts of other indigenous communities in India and provides guidelines to counter the irresponsible decisions made in the name of development by governments and private stakeholders benefiting from environmental clearances.

Key demand of the question:

One has to analyse in depth the need of some kind of environmental citizenship by the people to conserve and save our environment for longer and sustainable future.

Directive:

Analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Begin with importance of environmental citizenship – what is it and why is it necessary.

Body:

Explain the following aspects in the answer:

Explain why assertion of environmental citizenship by the people of India is the need of the hour?

What are the means and ways people can assert their environmental citizenship? – here one can quote example, as suggested in the article one can talk about the religious beliefs of various communities, tribal communities etc.

Discuss how role of citizens is as important as role played by government, other organizations and NGOs etc.

Conclusion:

Conclude with way forward.

Introduction:

- Environmental Citizenship is an idea that each of us is an integral part of a larger ecosystem and that our future depends on each one of us embracing the challenge and acting responsibly and positively toward our environment. It's about making changes in our daily lives to be environmental citizens all day, every day.
- Religious notions of indigenous communities in India provide an understanding of the natural order, and resources to resist its degradation.

Body:

Need for environmental citizenship to be practiced:

- Cutting of trees, escalating construction without consideration to secure water catchment areas or aquifers.
- The approaching national water emergency is not because of lack of rains or water bodies, but mismanagement of resources on the ground.
- The disturbance in water, earth, vegetation, river and mountain ecology system has threatened all manner of life.
- Increasing number of irresponsible decisions made in the name of development by governments and private stakeholders benefiting from environmental clearances.
- The traditional wisdom in the semantics of development is marginalised — building roads, setting up industries, creating infrastructure spell short-term gains for the few and apocalypse for humanity as a whole.
- Social groups, traditionally, create livelihoods by harnessing available natural resources. Not factoring cultural wisdom to conserve natural environment impacts geographies and, in turn, reconfigures cultural responses.

Methods of practicing Environmental Citizenship:

- **A Green Lifestyle:**
 - Different parts of our website show how important it is to adopt a lifestyle that helps the environment.
 - Another way that you can engage in good environmental citizenship is to keep waste down to a minimum in your home.
 - The key to this is to reduce, reuse and recycle.
- **Culture as a tool:**
 - The Hindu concept of Rta dharma, explained by Kapila Vatsyayan in her essay 'Ecology and Indian Myth', states that the moral duty of communities is through karma towards sustaining and maintaining Rta (cosmic natural order).
 - The same thought is reiterated in the Guru Granth Sahib: The book enunciates a concern for the environment as an integrated approach to life and nature by stating that air, water, earth, and life — all originated from the True Lord who resides in each one of us and requires protection.
 - Islamic scholar Sigrid Nökel offers similar ideas through terms such as fitra creation as natural order; tawhid — that all things in the world are related to one another and are, as aspects of God, valuable and worthy of preservation; and, that khilafa refers to the role of mankind as the trustee of creation.
- **Participate in Environmental Decision Making:**
 - One good way of exercising environmental citizenship is to get involved in the environmental decision making process.
 - The community ownership expressed in the protests in Chhattisgarh requires duplication in many more areas.
 - To protect their forests and sacred hills, the indigenous forest communities organised protests initiated by the Sanyukt Jansangraha Samiti against the mining of Deposit 13 of the Bailadila iron ore mine in Chhattisgarh's Dantewada district
- **Hold Businesses to Account:**
 - Industries and businesses have a tremendous impact on the environment. Help them to act responsibly as you make your consumer choices on goods or services.

- The uprising a few years ago of the Dongria Kondhs of Odisha who eventually won a David-and-Goliath battle against mining giant Vedanta Resources.
- **Access to Environmental Information:**
 - It will be difficult to participate in environmental decision making, without having adequate access to environmental information.
 - Environmental information includes, information held by public bodies on air, water, soil, land, plants and animals, energy, noise, identity of polluters from the pollution registers, waste and emissions.
 - Using the RTI act, Forest Rights Act to protect the rights of the Scheduled tribes and Forest dwellers.
- **Access to Justice in Environmental Matters:**
 - It involves the right of all to access legal help and to get adequate judicial redress on environmental issues.
 - The cost of taking a case to court has been identified as a major barrier to access to environmental justice.

Conclusion:

- A systematic citizens' network of environment panchayats to promote environmental sustainability is required.
- What is needed is the will to support, and to ensure, environmental protection for and by the people of India.

Q) Forest dwellers and farmers are the best hope to preserve biodiversity and ensure food security. Discuss the statement with suitable examples. (250 words)

The hindu

Why this question:

The article deals in what way forest dwellers and farmers are the best hope to preserve biodiversity and ensure food security.

Key demand of the question:

The answer is straight forward and must discuss the role of forest dwellers, tribal communities and the farmers in preserving biodiversity and ensuring food security.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain the context of the question.

Body:

Discussion should be followed by suitable examples to justify the role of forest dwellers, for e.g. the case study of Dongria Kondh tribe of Niyamgiri Hills – they are among the best conservationists in the world. Known for the spirited defense of their forested habitat against short-sighted industrialization, they have through millennia evolved a lifestyle that is in perfect harmony with nature.

Likewise explain the role played by farmers – in what way they help achieve food security.

Take cues from the article and discuss their significant role.

Conclusion:

Conclude by reasserting their significant role played in conserving and preserving the biodiversity and ensuring food security.

Introduction:

- The UN-backed panel's **first global assessment of biodiversity** held humans squarely responsible for the looming mass extinction of species.
- A loss in biodiversity simply means that plants and animals are more vulnerable to pests and diseases, and it puts food security and nutrition at risk. In this context, forest dwellers and farmers are the best hope to preserve biodiversity and ensure food security.

Body:

Challenges posed due to dwindling biodiversity:

- The situation with India's forests now is less encouraging.
- Nature now faces the threat of another mass extinction of species.
- Pressure from industrialisation does not care too much about conservation and biodiversity.

- The same holds true for the overexploitation of our rivers and seas.
- Without radical efforts towards conservation, the rate of species extinction will only gather momentum.
- There is no single national-level answer to the problem of crop and biodiversity loss.
- For instance, the natural farming movement in Andhra Pradesh may not be suitable for, say, Punjab.

Importance of indigenous people in biodiversity conservation:

- Across India, there are many indigenous people who have managed to lead safe lives without any needless destruction of natural ecosystems.
- These tribes, along with marginalised communities living on the fringes of forests and millions of smallholder farmers, have a crucial role now.
- They offer the much-needed solutions to the bio-diversity challenges of the present era

Case study:

- The Dongria Kondh tribe of Niyamgiri Hills are among the best conservationists in the world.
- Known for the spirited defence of their forested habitat against short-sighted industrialization, they have through millennia evolved a lifestyle that is in perfect harmony with nature.
- Nothing can be achieved without the active participation of communities that live close to nature — farmers and forest dwellers.

Way forward:

- Although biodiversity loss is a global problem, it can be countered only with local solutions, as there is no one-size-fits-all approach in this.
- India's tropical homeland is rich in biodiversity.
- But, the imperatives of relentless economic growth, urbanisation, deforestation and overpopulation place it at a higher risk.
- Certainly, a solution that has succeeded in a temperate, wealthy nation may not be suitable for a country like India.
- It is now obvious that intensive agriculture, exploitative forestry and overfishing are the main threats to biodiversity in India and the world.
- Given these, the approach now should be to ensure the active participation of communities that live close to nature – farmers and forest dwellers.
- Innovative policies should take lead like the –
 - growing movement of zero-budget natural farming in Andhra Pradesh and Telangana
 - the community-driven forest conservation initiatives in Odisha and the Northeast
- The UN agencies too have emphasized on the significance of the accumulated wisdom of indigenous peoples, fishers and farmers.

Conclusion:

- Local people should be at the centre of all the actions taken at dealing with the challenges of nature. Instead of evicting forest dwellers from their homes, the country should be encouraging them to conserve and nurture their habitats.
- Their knowledge about the local geography, climate, and relief will help in better conservation of the biodiversity.

Q) Untreated waste water poses a threat to both human health and the aquatic ecosystems. Explain the statement with examples. (250 words)

Reference

Why this question:

The article discusses the threats posed by untreated waste water on human health and aquatic health.

Key demand of the question:

Explain in detail the ill effects posed by the untreated waste water, what needs to be done to address the same.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly introduce problem of untreated water.

**Body:**

Explain with few facts – The 2017 United Nations World Water Development Report (WWDR) notes that more than 80% of the world's wastewater is released into the environment untreated.

Write about impact of untreated wastewater – on health, economy, environment etc.

Discuss what should be the way forward.

Conclusion:

Conclude by suggesting solutions.

Introduction:

- Wastewater is any water that has been adversely affected in quality by anthropogenic influence. Wastewater can originate from a combination of domestic, industrial, commercial or agricultural activities, surface runoff or storm water, and from sewer inflow or infiltration.
- The **2017 United Nations' Water Development Programme's World Water Development Report (WWDR)** notes that more than 80% of the world's wastewater — over 95% in some least developed countries — is released into the environment untreated.
- The **National Green Tribunal** has directed 18 States and 2 Union Territories to submit their respective action plans on utilisation of treated wastewater to reduce pressure on the groundwater resources across the country.

Body:

Threats posed by untreated wastewater:-

- **Water borne diseases:** such as polio, cholera, typhoid etc; slum dwellers are at a greater risk due to poor drainage in slums.
- **Threat to water bodies & aquatic life:** wastewater is rich in nutrients which eutrophics water bodies causing algal bloom, increase in BOD, killing the aquatic life beneath.
- **Biomedical waste:** many city hospitals dump biomedical waste into drains thereby multiplying the toxicity of wastewater.
- **Pollution of Rivers:** Indian rivers like Ganga, Yamuna are being severely polluted by effluents discharges by industries hence wastewater by domestic and other sources adds to the problem.
- **Reduced flow and corrosion** in sludge pipes due to build-up of organic content hence it severely damages the infrastructural set up.
- **Toxic gases** like Hydrogen Sulphide, CO₂, ammonia, methane produced from slurry can become hazardous to people and animal around.

Way forward:

- **Tapping and Recycling waste water resources**
- **Need of national Water policy,** on lines of Rajasthan – 1st state to implement sewage water policy
- **Extraction of by-products:** such as salt, nitrogen, phosphorous will be useful for local businesses.
- **Industrial applications:** for cooling purposes in power stations, industrial machinery etc; Singapore uses reclaimed water called '**NEWater**' to serve 30% of its needs.
- **Role of government, municipalities:** need to enforce stricter norms regarding dumping of wastewater, improve process for treatment of wastewater.
- **Improve infrastructure:** setting up more wastewater treatment plants in every municipality funding them through municipality bonds.
- **Cultural change:** the culture of wasting water needs to be changed through educational campaigns.
- **New technology:** like sequencing batch reactor – C-TECH technology that was adopted in Navi Mumbai, meets the standards of EUROPEAN UNION in terms of treated water quality.
- A paradigm shift from "**use and throw – linear**" to a "**use, treat, and reuse – circular**" approach is needed to manage wastewater.
- Investment in wastewater treatment has associated risks as well. It is therefore important to understand the underlying social, political, technical, and financial factors that will drive, facilitate, and sustain wastewater management interventions in India.

Conclusion:

- Sustainable Development Goal (SDG) 6 specifically focuses on water and sanitation, with Target 3 addressing water quality, but the availability of water is a cross-cutting issue upon which every aspect of development hinges.
- Put simply, water is life, and without a sustained commitment to improving and benefiting from effective wastewater management, that precious resource, and the billions of lives it nourishes, is in peril.

Q) Discuss the key features of Climate Change Performance Index (CCPI) also bring out the key findings' of 2019 edition. (250 words)

Reference

Why this question:

The question is based on the theme of CCPI and the key findings of 2019 edition.

Key demand of the question:

The answer must discuss in detail the relevance of the report, features and its major highlights.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

The Climate Change Performance Index (CCPI) is an instrument covering 58 countries and supposed to enhance transparency in international climate politics.

Body:

The 2019 edition of the Climate Change Performance Index (CCPI) has been released which illustrates regional differences in climate protection and performance within the 56 evaluated countries and the EU.

No country performed well enough to reach the ranking 'very good' in this year's index.

Explain that its aim is to encourage political and social pressure on those countries which have, up to now, failed to take ambitious actions on climate protection as well as to highlight countries with best-practice climate policies.

Discuss the highlights and bring out the performance reported for India.

Conclusion:

Conclude with significance of the findings.

Introduction:

- The Climate Change Performance Index (CCPI) is an instrument covering 58 countries and supposed to enhance transparency in international climate politics. It is an annual publication by **Germanwatch, NewClimate Institute and Climate Action Network Europe**.
- Its aim is to **encourage political and social pressure on those countries which have, up to now, failed to take ambitious actions on climate protection as well as to highlight countries with best-practice climate policies**.

Body:

Key features:

- The top three positions of the CCPI 2019 are still unoccupied, because none of the 56 countries or the EU are clearly on a well below 2°C pathway in their overall performance.
- The four categories examined are: GHG emissions (40%), renewable energy (20%), energy use (20%) and climate policy (20%).
- The latter is based on expert assessments by NGOs and think tanks from the respective countries.
- The CCPI also evaluates to what extent the respective countries are taking adequate action within the categories emissions, renewables and energy use to being on track towards the global Paris-goal of limiting global warming to well below 2°C.
- Therefore, the CCPI is an important tool in contributing to a clearer understanding of national and international climate policy.

Key findings of CCPI 2019:

Global Performance:

- Morocco has been named the second best performing country after Sweden in the Climate Change Performance Index (CCPI).
- With the connection of the world's largest solar plant to the grid, Morocco is on track for achieving its target of 42% installed renewable energy capacities by 2020.
- Sweden is in top position, followed by Morocco and Lithuania in the CCPI 2019.
- The bottoms five in the list are Saudi Arabia, U.S., Iran, South Korea and Taiwan.

India's Performance:

- India ranks 11th in this year's CCPI, improving its standing by three places compared to the previous edition.
- Most notably India improved its performance in the Renewable Energy category, joining the group of medium

- However, national experts argue that plans to build new coal-fired power plants may pose a risk of offsetting positive developments in the renewable energy sector.
- Comparatively low levels of per capita GHG emissions and a relatively ambitious mitigation target for 2030 give India an overall high rating in the emissions category.

Components of the CCPI

GHG = Greenhouse Gases | TPES = Total Primary Energy Supply

© Germanwatch 2018

Conclusion:

- While there is a continued growth and competitiveness of renewable energy, especially in countries that had low shares before, the CCPI shows a lack of political will of most governments to phase out fossil fuels with the necessary speed.
- Because of that, in most countries the climate policy evaluation by national experts is significantly lower than in the last years.

Q) Analyse the reasons behind India's problem of e-waste and provide an account for the ineffectiveness of the rules. (250 words)

Reference

Why this question:

The article provides a closer look at the menace of e-waste that India is facing.

Key demand of the question:

The answer must look into the reasons leading to the problems of e-waste with special emphasis on the ineffectiveness of rules and regulations dealing with it.

Directive:

analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Discuss in brief what you understand by e-wastes, how are they generated etc.

Body:

Introduce briefly e-waste problem through relevant facts.

Enumerate causes of e-waste.

Describe the reasons for the failures of e-waste guidelines to control the problem.

Explain that when E-waste are dismantled and disposed unscientifically, they release extremely harmful gases or large particulates into environment causing hazardous air pollution causing severe health hazards.

Thus, there is need to implement the E-waste management rules 2016 effectively and deal with the problem of e-waste more holistically with proper monitoring mechanisms in place.

Conclusion:

Conclude by suggesting way ahead, suggest solutions at policy level, technology level etc.

Introduction:

- A recent **UN report** titled '**A new circular vision for electronics**' warned that '**Tsunami of e-waste**' was to hit the world soon. The report notes that the waste stream has already reached **48.5 million tonnes (MT) in 2018** and the figure is expected to double if nothing changes.
- In India, e-Waste accounts for **70% of the landfills. (2011 Rajya Sabha Secretariat Study)**. By 2050, India will likely stare at a pile of a new category of electronic waste, namely **solar e-waste**. India's **PV (photovoltaic) waste volume is estimated to grow to 200,000 tonnes by 2030 and around 1.8 million tonnes by 2050**.

Body:

The **root causes** of India's e-Waste problem are:

- e- Waste is technically all waste electrical and electronic equipment (WEEE) discarded without the intent of use.
- It comprises not just electronic items, but also all electrical equipment that involves anything with a plug, electric cord or battery.
- In recent years, e-waste has grown faster than earlier anticipated. By 2021, the annual total volume is expected **to surpass 52 MT**, considering the fact that the number of devices connected to the internet is going to be between **25-50 billion by 2020**. **By 2050, the volume of e-waste in the worst-case scenario, could top 120 MT annually**.
- In India, e waste accounts for **4% of global e-waste and 2.5% of global GDP** (2014 figures) – so it has a higher share of e-waste than its share of gross domestic product (GDP).
- The **informal sector** manages about **95% of the e-Waste in India**. Due to the informal and crude processing techniques, the soil, water and air are polluted to a beyond-repairable level. **Example:** Moradabad and Seelampur.
- The **hard-to-recover substances from e-waste like mercury, arsenic** make their home in landfills and keep leaching into ground water.
- **Incineration** is one of the most practiced methods of recycling leading to high carbon emissions and poisoning of air with toxic gases.
- **The poor implementation of Extended Producer Responsibility** as mandated under **e-Waste Management Rules, 2016** is another challenge.
- The **export of e-Waste from developed countries** is another growing problem despite regulations under **Basel Convention on the Control of Transboundary Movement of Hazardous Wastes and Their Disposal**.

Causes for failure of rules and regulations for e-Waste:

- India has 19 PROs (producer responsibility organisations), which are hired for collection as of today but there is no level playing field.
- There is no independent mechanism to verify if EPR is being implemented. The law mandates random inspections by the Central Pollution Control Board (CPCB) and state PCBs, but there's no record of them.
- The issues of how to address the ones using the products: how do you get people to hand back their products in a reasonable way.
- The lack of companies' initiative to build an image of a responsible actor, of someone consumers can believe in.
- Customer care representatives do not have inkling about any take back or recycling programme and even if they have set up collection centres, they are simply not enough for a geographically vast country like India.
- India being a vast country, setting up collection mechanism is a big challenge. If any of the brands try individually to reach out to all corners of the country, it will economically not be sustainable or feasible.

Measures to control the e-Waste growth:

- **Unified effort:** The report calls for systematic collaboration with major brands, small and medium-sized enterprises, academia, trade unions, civil society and associations in a deliberative process to reorient the system and reduce the waste of resources each year with a value greater than the GDP of most countries.
- **Holistic management:** To **capture the global value of materials in e-waste and create global circular value chains, use new technology to create service business models, better product tracking and manufacturer or retailer take-back programmes**.
- **Scaling up recycling:** The report notes that **material efficiency, recycling infrastructure and scaling up the volume and quality of recycled materials** to meet the needs of electronics supply chains will all be essential for future production.

- **Incentivization:** The producers should also have buy-back or return offers for old equipment, and plans to incentivise the consumer financially. The report also advocates a system of 'urban mining' by strengthening the **extended producer responsibility provision**.
- **Job potential:** If the electronics sector is supported with the right policy mix and managed in the right way, it could lead to the **creation of millions of decent jobs worldwide**.
- **Awareness & Education:** there is an acute lack of awareness among people as they simply don't know that there exist collection centres that collect items for recycling. The law will fail to serve the purpose unless these changes are made on the ground.

Conclusion:

- A strong political will is required to come out with strict regulations to manage e waste in India. Increased public awareness is the need of hour.
- It is now to be seen how the stakeholders who turned a blind eye to the rules so far, proceed ahead.

Q) Enumerate the significant elements of India's Intended Nationally Determined Contribution (INDC) ? Explore the methods of financing for meeting the objectives of India's INDC. (250 words)

Reference

Introduction:

- **Intended Nationally Determined Contributions or INDCs**, are publically declared country commitments indicating the actions each country would take under a new global agreement, which would eventually take its final shape in December 2015 at the 21st session of the signatories /parties to the United Nations Framework Convention on Climate Change (UNFCCC).
- The INDCs will largely determine whether the world achieves an ambitious 2015 agreement and is put on a path toward a low-carbon, climate-resilient future. Government of India submitted its INDCs on 1st October 2015 to the UNFCCC.

Body:

Salient features of India's INDC:

- To put forward and further propagate a healthy and sustainable way of living based on traditions and values of conservation and moderation.
- To adopt a climate-friendly and a cleaner path than the one followed hitherto by others at corresponding level of economic development.
- To reduce the emissions intensity of its GDP by 33 to 35 per cent by 2030 from 2005 level.
- To achieve about 40 per cent cumulative electric power installed capacity from non-fossil fuel based energy resources by 2030, with the help of transfer of technology and low cost international finance, including from Green Climate Fund.

Key elements and focus areas of India's INDC:

India's INDC centre around the country's policies and programmes for:

- **Sustainable Lifestyles:** To put forward and further propagate a healthy and sustainable way of living based on traditions and values of conservation and moderation.
- **Cleaner Economic Development:** To adopt a climate friendly and a cleaner path than the one followed hitherto by others at corresponding level of economic development.
- **Reducing Emission intensity of Gross Domestic Product:** To reduce the emissions intensity of its GDP by 33 to 35 percent by 2030 from 2005 level.
- **Increasing the Share of Non Fossil Fuel Based Electricity:** To achieve about 40 percent cumulative electric power installed capacity from non-fossil fuel based energy resources by 2030 with the help of transfer of technology and low cost international finance including from Green Climate Fund (GCF).
- **Enhancing Carbon Sink:** To create an additional carbon sink of 2.5 to 3 billion tonnes of CO₂ equivalent through additional forest and tree cover by 2030.
- **Adaptation:** To better adapt to climate change by enhancing investments in development programmes in sectors vulnerable to climate change, particularly agriculture, water resources, Himalayan region, coastal regions, health and disaster management.
- **Mobilizing Finance:** To mobilize domestic and new & additional funds from developed countries to implement the above mitigation and adaptation actions in view of the resource required and the resource gap.

- **Technology Transfer and Capacity Building:** To build capacities, create domestic framework and international architecture for quick diffusion of cutting edge climate technology in India and for joint collaborative R&D for such future technologies.

Methods of financing for meeting the objectives of India's INDC:

- As per estimates, at least USD 2.5 trillion (at current prices) required between now and 2030 to implement all planned actions.
- USD 206 million required for adaptation actions. Much more needed for strengthening resilience and disaster management.
- About USD 834 billion, at 2011 prices, required for mitigation actions till 2030.
- A total of INR 170.84 billion collected through cess on coal production. Being used for funding clean energy projects
- **National Clean Energy Fund:** The Fund was created to promote clean energy, funded through an initial carbon tax on use of coal by industries.
- **National Adaptation Fund** has been created with initial allocation of Rs 3500 million.
- **Clean Development Mechanism (CDM):** It allows emission-reduction projects in developing countries to earn certified emission reduction (CER) credits, each equivalent to one tonne of CO₂. The CDM is the main source of income for the UNFCCC Adaptation Fund.
- In February 2015, at the **REInvest renewable energy financing event** hosted by the Indian government, the MNRE invited public and private corporate and financial firms to invest in the country's renewable energy sector in the five-year period from 2015-2019.
- **Tax free infrastructure bonds** of INR 50 billion being introduced for funding renewable energy projects
- The **CAMPA act** passed helps use the money collected under compensatory afforestation funds.
- **Polluter Pays:** The 'polluters pays' principle is the commonly accepted practice according to which those who produce pollution should bear the costs of managing it to prevent damage to human health or the environment. This principle underpins most of the regulation of pollution affecting land, water and air formally known as the 1992 Rio Declaration.

Other feasible measures:

- **Green Bonds:** Bonds issued to raise money especially for Green projects.
- Creation of Renewable Energy Investment Trusts as in UK.
- Incorporating renewable energy within **Priority Sector Lending requirements**
- **Public-private partnership (PPP) and PPP People (PPPP)** can help improving climate finance.

Conclusion:

- An analytical framework is necessary to combine potential climate risks with a systematic cost-benefit analysis. Favourable policy and institutional actions are important for successful introduction or scaling up of financial instruments.
- Climate finance should be equipped with non institutional financial services such as market funds, private etc.

Q) Discuss the risks and benefits of Eco-Tourism with examples in India ? (250 words)

[Reference](#)

[Reference](#)

Introduction:

- Ecotourism as a term first emerged during the late 1980s with **growing global concern for sustainable practices with regard to ecologies extending towards minimizing the degenerative results of tourism on the environment.**
- Ecotourism thus essentially has come to imply **responsible travel practices when exploring natural conditions such that travel practices are conducted with a view towards environmental conservation, environmental sustainability and the welfare of local communities.**
- This involves generating practices that aim towards better interpretation of tourism practices and education regarding the above.

Body:

- Ecotourism was introduced in India after the World Tourism Organization announced 2002 as the International Year of Ecotourism coming under the United National Environmental Program.
- **Thenmala in Kerala** is India's first planned and certified ecotourism destination. Other than this there are many national parks and sanctuaries in India that act to cater to tourism and work towards environmental conservation at the same time (Eco India, 2008). Many ecotourism sites are now present in India.

**Benefits:**

- **To increase foreign exchange:** Ecotourism is one of the important industries that earn foreign exchange for a country without actually exporting any material. The income from ecotourism has tended to increase at a higher rate than merchandise export in a number of countries.
- **To help in the development of infrastructure facilities:** Development and improvement of infrastructure facilities are another important benefit offered by the ecotourism industry. A variety of secondary industries may be promoted which may not serve the needs of. Thus, indirectly; tourist expenditure may be responsible for stimulating other economic activities of a country.
- **To help in balanced regional development:** Tourism development greatly benefits underdeveloped regions of a. These economically backward regions mostly have places of high scenic beauty which if developed for the tourism industry, will help to bring a lot of prosperity to the local people.
- **To help in generating employment:** Tourism industry is highly labour intensive service industry that generates employment for highly skilled, semiskilled and unskilled labour in sectors like hotels, restaurants, travel agencies, tourism offices, shops etc.
- **To help in maintaining peace and understanding:** Tourism plays an important role in promoting international. It creates awareness and appreciation of other countries culture and nature.

Risks:

- Ecotourism that is not properly implemented in a learned manner can thus fall prey to commercialization, and more often than not commercial interests can overrun the pedagogy of policy on the ground level.
- It is the major threat to the rich biodiversity and natural habitats of the wilds in the jungles.
- Eco tourism tends to conserve the environment at the expense of the development prospects for the third world communities.
- Located in the eco systems, eco tourism projects it is the biggest obstacle in the way of the development of the environment.
- Competition for eco tourism income between the various groups leads to social disharmony.
- To cater to the increasing demand for eco-tourism, land around parks and sanctuaries is being cleared through deforestation, displacement of people etc. to accommodate hotels, resorts etc.
- Increased use of resources by the human population, even in the smallest sense cause problem to the environment.
- Another major threat to the environment is the production waste and effluent pollution as well as increasing human activities like logging, and agricultural clearance.
- Eco-tourism takes away livelihoods from the locals, and in return provides them with low-paying subordinate positions in the resorts etc that are established. No viable long-lasting employment opportunities with scope for growth are provided to the locals.

Conclusion:

- India is one of the 12-mega bio-diverse countries of the world and has a rich cultural heritage too. It has a vast potential for ecotourism that needs to be tapped for healthy conservation and preservation of nature and bringing about economic benefits to the local communities.

Q) Discuss the Objectives of Environmental Impact Assessment in India also trace the recent developments in this direction while commenting on the current framework of the same. (250 words)

Reference**Why this question:**

The question is straightforward and is about analyzing the EIA process and its objectives.

Key demand of the question:

The answer must discuss in detail the objectives of EIA and trace the recent developments in this direction.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what is EIA.

Body:

Explain the Objectives of Environmental Impact Assessment

- Identifying, predicting and evaluating economic, environmental and social impacts of development activities.
- Providing information on the environmental consequences for decision making.
- Promoting environmentally sound and suitable development by identifying appropriate alternatives and mitigation measures.

Discuss the importance and relevance.

Explain the framework existing in India, progress made on different fronts etc.

Conclusion:

Conclude with way forward.

Introduction:

- Environmental Impact Assessment (EIA) is an important management tool for ensuring optimal use of natural resources for sustainable development. It covers developmental sectors such as industries, thermal power projects, mining schemes etc.
- EIA has now been made mandatory under the Environmental (Protection) Act, 1986 for 29 categories of developmental activities involving investments of Rs. 50 crores and above.

Body:

The objective of the EIA:

- To identify, predict and evaluate the economic, environmental and social impact of development activities.
- To provide information on the environmental consequences for decision making.
- To promote environmentally sound and sustainable development through the identification of appropriate alternatives and mitigation measures.
- To identify and quantify emission sources and determine the significance of impacts on sensitive receivers and potential affected uses.
- To identify and quantify any potential losses or damage to flora, fauna and natural habitats.

Issues Related to EIA:

- Environmental decision-making processes for development projects are supposed to use the best available scientific knowledge to ensure that development does not lead to negative impacts.
- But there are compromised decision-making on development and infrastructure projects.
- Sometimes the EIA reports lack the expected degrees of honesty, owing to bias, corruption, exaggeration and wrong claims.
- EIA reports for the approved “redevelopment” projects in Delhi were prepared by copying from copyrighted papers, web-pages and other EIA reports.
- There are many instances of missing or misleading information which understate the potential impact of the projects.
- Many projects are approved without public consultation.
- Lack of awareness among the local people about the process of EIA, its significance for them, their own rights and responsibilities.
- Most of the time EIA reports are unavailable in local languages, thus local people are unable to decipher the reports, and are misled by the proponents

Way Forward:

- Competent authorities must ensure that a project causes minimal adverse environmental impact and generates maximum social and economic benefits.
- Involving affected people and concerned citizens in environmental decision-making has far reaching effects.
- It allows for democratising environmental governance.
- Participatory processes give opportunities to understand and plan for unforeseen effects.
- In 2009, the **Delhi High Court in Utkarsh Mandal v/s Union of India** upheld that it is the duty of the EACs to consider the merits of the objections raised at the public hearings.
- Women and other vulnerable sections of the society are the first and most affected by consequences of developmental processes and damage to the environment.

- Adverse impacts of development projects can be reduced with the full and equal participation of both genders, particularly women in decision-making processes.
- NGOs, civil society groups and local communities need to build their capacities to use the EIA notification towards better decision making on projects.

Conclusion:

- An EIA should not be used just as a means for obtaining an environmental clearance; rather, project proponents should use it as a management tool to assess the soundness of a project plan.
- The focus of EIA needs to shift from utilization and exploitation of natural resources to conservation of natural resources.

Q) “National Policy on Biofuels 2018 is essentially a resolution but not a solution in itself”. Critically analyse. (250 words)

Reference

Why this question:

The National Policy on Biofuels-2018 approved by the Government envisages an indicative target of 20% blending of ethanol in petrol and 5% blending of bio-diesel in diesel by 2030.

Key demand of the question:

The answer must analyse National Policy on Biofuels 2018 and critically discuss in what way it is not an end in itself.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Describe in brief the national biofuel policy 2018.

Body:

The answer must discuss the following aspects –

First discuss the salient features of national biofuel policy 2018.

Then discuss other than the policy what are the on ground requirements to propel the use of biofuels in India, discussion should debate about the availability of resources, technology etc. and justify that one policy alone would not change the energy scenario but a framework regulating the energy sector in a multi-pronged approach is the need of the hour.

Conclusion:

Conclude with solutions.

Introduction:

- Any hydrocarbon fuel that is produced from an organic matter (living or once living material) in a short period of time (days, weeks, or even months) is considered a biofuel. Biofuels may be solid, liquid or gaseous in nature.
- The National Policy on Biofuels-2018 approved by the Government envisages an indicative target of **20% blending of ethanol in petrol and 5% blending of bio-diesel in diesel by 2030.**

Body:

Salient features of National Policy on Biofuels, 2018:

- **Categorization:** The Policy categorises biofuels as “Basic Biofuels” viz. First Generation (1G) bioethanol & biodiesel and “Advanced Biofuels” – Second Generation (2G) ethanol, Municipal Solid Waste (MSW) to drop-in fuels, Third Generation (3G) biofuels, bio-CNG etc. to enable extension of appropriate financial and fiscal incentives under each category.
- **Scope of raw materials:** The Policy expands the scope of raw material for ethanol production by allowing use of Sugarcane Juice, Sugar containing materials like Sugar Beet, Sweet Sorghum, Starch containing materials like Corn, Cassava, Damaged food grains like wheat, broken rice, Rotten Potatoes, unfit for human consumption for ethanol production.
- **Protection to farmers:** Farmers are at a risk of not getting appropriate price for their produce during the surplus production phase. Taking this into account, the Policy allows use of surplus food grains for production of ethanol for blending with petrol with the approval of National Biofuel Coordination Committee.

- **Viability gap funding:** With a thrust on Advanced Biofuels, the Policy indicates a viability gap funding scheme for 2G ethanol Bio refineries of Rs.5000 crore in 6 years in addition to additional tax incentives, higher purchase price as compared to 1G biofuels.
- **Boost to biodiesel production:** The Policy encourages setting up of supply chain mechanisms for biodiesel production from non-edible oilseeds, Used Cooking Oil, short gestation crops.

Biofuel policy is not a panacea in itself:

- **Supply-chain infrastructure** that is required to deliver biofuels to the final consumer remains inadequate.
- To convert India's existing biofuel potential into reality, **huge investments** need to be made in creating bio refinery capacity. However, this is easier said than done. While state-owned oil marketing companies are in the process of setting up 12 bio-refineries, this can only be a base to build on.
- On the ground, **private sector investment in this space has been hampered by financial constraints and lack of cohesive support** from the Central to the local level.
- **Efficiently transporting low value biomass to the refineries is another challenge.**
- The policy is **totally silent on octane**, which has direct consequences on air quality and pollution as it assists in proper combustion of fuels, thereby affecting vehicular emissions.
- **Over ambitious:**
 - The policy states that a viability gap funding scheme for 2G ethanol bio refineries of Rs. 5,000 crore in 6 years in addition to additional tax incentives, higher purchase price as compared to 1G biofuels will be provided.
 - The policy is overambitious in light of the fact that the capability of 2G has not been realised till today. Therefore, completely relying on a mechanism which has not been proven commercially is flawed.

Way forward:

- Any bio-fuel policy must be strongly backed by sufficient technology and production scale in order to be financially feasible and implementable.
- Given the current market dynamics, sugar industry's share in the bio-fuel mix is unrivalled – thereby underscoring the need for better pricing for ethanol.
- The consideration for using food grains is a tricky one as food supply chains might get affected if there aren't proper checks.
- While source diversification is indeed a positive, proper enhancement of supply-chain infrastructure to reach the final consumer will prove vital.
- The government should also take steps to remove policy barriers that have discouraged private investment in building supply chains.

Conclusion:

- From encouraging the use of biofuels in public transport to ensuring that civic bodies actually realise the potential of municipal waste and sewage the policy needs to be implemented in mission mode on a nationwide basis.

Q) Discuss the concept of carbon tax, also analyse to what extent it can prove to be an effective policy instrument in achieving INDC targets for India. (250 words)

[Financialexpress](https://www.financialexpress.com)

Why this question:

The question is based on the concept of carbon tax and the utility of the same as an effective policy instrument.

Key demand of the question:

One must detail on the concept of carbon tax and list down its advantages and potential.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is carbon tax.

Body:

Carbon tax is a form of pollution tax. It levies a fee on the production, distribution or use of fossil fuels based on how much carbon their combustion emits. The government sets a price per ton on carbon,

and then translates it into a tax on electricity, natural gas or oil. Because the tax makes using dirty fuels more expensive, it encourages utilities, businesses and individuals to reduce consumption and increase energy efficiency.

List merits –

Carbon tax also makes alternative energy more cost-competitive with cheaper, polluting fuels like coal, natural gas and oil.

Carbon tax offers social and economic benefits.

It is a tax that increases revenue without significantly altering the economy while simultaneously promoting objectives of climate change policy.

The carbon tax is the most practical method to reduce the fossil fuel consumption. It checks the use of fossil fuel.

It helps India to reach the committed INDC of 33% by 2030.

Conclusion:

Conclude with way forward.

Introduction:

- A carbon tax aims to **internalise the externality of climate change by setting a price on the carbon content of energy consumed or greenhouse gas emitted in the production or consumption of goods.**
- India is taking varied efforts to curb pollution and achieve the Intended Nationally Determined Contributions (INDC) targets under the Paris climate deal. In this regard, it is essential to understand the instrumental role that carbon tax could play.

Body:

Carbon tax as a potent mitigation policy:

- Carbon tax avoids the problems related to choosing a baseline. In a price approach, the natural baseline is a zero carbon tax.
- A carbon tax policy will be better able to adapt to the element of uncertainty which pervades the science of climate change. Quantity limits on emissions are related to the stocks of greenhouse gas emissions, while the price limits are related to the flow of emissions.
- From this uncertainty arises another complication of price volatility which is the reason why a carbon tax policy is likely to cause less volatility in the prices of carbon emissions
- Carbon tax primarily discourages environment unfriendly production and consumer practices by making the 'polluting sources' costlier.
- This works without any negative effect on overall employment and output levels.
- Putting a price on carbon and taxing it directly is far better than the 'cap and trade' system.
- This is because the carbon tax system has advantages due to its simplicity, affordability, transparency, revenue recycling and predictability of carbon prices.
- It works on the principle of 'the polluter pays'.
- The carbon tax will essentially be a **Pigovian Tax** which balances the marginal social costs and benefits of additional emissions, thereby internalising the costs of environmental damage. It can act as an incentive for consumers and producers to shift to more energy-efficient sources and products.

Way forward:

- Some countries and regions such as the U.S. and the European Union already have fairly successful carbon pricing regimes in place in the form of carbon taxes and emissions trading schemes.
- Some other countries have introduced general taxes on energy consumption instead of direct taxes on carbon content. This can be a good starting point for a shift in policy by countries while they deliberate on a harmonised carbon tax regime.
- India has to become a pioneer among emerging economies and impose an explicit carbon tax, and let the polluters pay.
- Another near-term approach can be a '**cap-and-tax**' which combines the strengths of both quantity and price approaches. Cap-and-tax might also address the concerns of environmentalists that a price-based approach does not impose hard constraints on emissions.

Conclusion:

- Carbon tax is the most basic economic instrument which can be used to price carbon and combat CO₂ emissions, and correct negative externalities.
- India should take up carbon tax as an effective policy instrument in reducing different local pollutants and achieving INDC targets.

Q) What is wetland ? Explain the Ramsar concept of ‘wise use’ in the context of wetland conservation. Cite two examples of Ramsar sites from India. (250 words)

previous year question, Indian geography by Majid Hussain, Environment by Shankar IAS Academy.

Why this question:

The question is straightforward and is based on the concept of wetland.

Demand of the question:

The answer must discuss the concept of wetland in detail and discuss the Ramsar concept of wise use.

Directive word:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction

Define Wetland.

Body

Wetlands are ecotones between terrestrial and aquatic ecosystems. They get periodically get inundated with water. They support a flourishing community of aquatic organisms including frogs and other amphibians. Swamps, marshes and mangroves are examples of wetlands.

Then discuss that the Ramsar “Wise use concept” requires that wetlands’ ecological character should be maintained within the framework of sustainable development.

Detail on the components of the concept. And conclude with examples.

Conclusion

Conclude with way forward and importance of such sites and conventions.

Introduction:

- The Ramsar Convention on wetlands defines wetland as including a wide variety of habitats such as marshes, peatlands, floodplains, rivers and lakes, and coastal areas such as salt-marshes, mangroves, and seagrass beds, also coral reefs and other marine **areas no deeper than six metres at low tide**. Wetland also includes **human-made wetlands such as waste-water treatment ponds and reservoirs**.
- Wetlands are ecotones between terrestrial and aquatic ecosystems. They get periodically get inundated with water. They support a flourishing community of aquatic organisms including frogs and other amphibians. Swamps, marshes and mangroves are examples of wetlands.

Body:

Ramsar “Wise use concept” requires that wetlands’ ecological character should be maintained within the framework of sustainable development. This concept recognizes that:

- **Developmental activities are inevitable** in wetland areas such as construction of roads, electricity infrastructure, schools and hospitals for poor families.
- **Economic activities are also inevitable** in wetland areas such as fisheries, farming and tourism.
- Such activities **aid in human development and economic development** in a wetland area.
- And for these activities, wetland’s land, water and bio-resources will have to be used.
- However, these **resources should not be used in a manner that wetland’s ecological character is harmed**.

The practical applications of “Wise Use” concept are as following:

- **Use of Water:** Farmers in wetland region require freshwater for cultivation of paddy, fruits and vegetables. But, it should not lead to overexploitation of freshwater else wetland’s regenerative capacity will suffer. Fish, reptiles and amphibians will die. Therefore, Government may impose legal ‘upper limits / ceiling’ on water use.
- **Use of Land:** Wetlands purify air and water, they moderate adverse weather impacts and thus protect human health. However, mining, infrastructure and transportation services harm wetlands, and thereby indirectly harm human health. Hence, the ‘land’ of wetland should be generally not used for such activities.
- **Use of Biomass:** Fishing is one of the primary occupations of people in Wetland area. But excessive fishing, especially during reproduction season will harm wetland’s foodweb. Hence, government may impose restriction and encourage aquaculture and ‘rice-fish’ management practices.

India currently has **27 sites** designated as Wetlands of International Importance (Ramsar Sites). Some of them are

- **Ashtamudi Wetland in Kerala**
- **Bhitarkanika Mangroves in Odisha**

Note: It is important to know all the site names from prelims and mains perspective

**Conclusion:**

- Wetland conservation is crucial for protecting biodiversity and mitigating the adverse impacts of climate change.
- At the same time, due to high level of poverty & population, it's not possible for developing countries & Least Developed Countries (LDCs) to keep wetlands in pristine conditions completely free from human activities.
- The "wise use" concept of Ramsar convention is a **notable attempt made to strike balance between these two opposing aspects**.

Topic: Disaster and disaster management.

Q) With warnings from India's policy-makers and reports of major cities in India struggling to cope with water crisis, exploring technologies to harness fresh water seems to be a ray of hope. Critically examine these technologies. How far would they be effective in preventing a water crisis in the future ? (250 words)

Livemint

Why this question:

The article discusses the major challenge of water crisis the country is facing and highlights the need of emerging technologies in addressing the issue.

Key demand of the question:

The answer must bring out the role that technology can play in harnessing effective ways of preventing water crisis in the coming future.

Directive:

Critically Examine – When asked to examine, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:**Introduction:**

Start with facts justifying the current water crisis conditions facing the country.

Body:

The question is straightforward and there isn't much to deliberate, students must first bring out the current conditions of water crisis in the country – state reasons, concerns posed etc. and then move on to explain in what way newer technologies can address the situation in an effective and sustainable manner.

Conclusion:

Conclude with significance of technology and put a word of caution that technology alone can not be a solution for the crisis but also awareness, sustainable use of water is the need of the hour.

Introduction:

- India is on the threshold of a very serious groundwater crisis, which needs mitigation both in the fields and at the policy corridors of the country.
- A World Bank study puts the plight of the country in perspective: 163 million Indians lack access to safe drinking water; 210 million Indians lack access to improved sanitation; 21% of communicable diseases are linked to unsafe water.
- Many Indian cities, including Delhi and Bangalore, face a water crisis, especially that of freshwater.

Body:**Technologies to harness fresh water:**

- **Rainwater Harvesting:** It is a process involving collection and storage of rain water (with the help of artificially designed system) that runs off natural or man-made catchment areas e.g. roof top, compounds, rock surface or hill slopes or artificially repaired impervious/semi-pervious land surface.
 - **Pros:** It reduces Runoff loss, helps meet rising demand of water by recharging the water table, No land is wasted for storage purpose and no population displacement is involved, increases the productivity of aquifer and reduces urban flooding.
 - **Cons:** High installation charges, lack of awareness and education,

- **Desalination:** It is a technology that converts salt water into freshwater using reverse osmosis (RO). Osmosis involves 'a solvent naturally moving from an area of low concentration, through a membrane, to an area of high concentration'
 - **Pros:** Abundance of Seawater around India. RO is commercially proven and the dominant technology. It is easier for attracting the private players.
 - **Cons:** RO plants convert seawater to fresh water, the major environmental challenge they pose is the deposition of brine (highly concentrated salt water) along the shores. This reduces the availability of prawn, sardine and mackerel. Environmentalists second this saying that hyper salinity along the shore affects plankton, which is the main food for several of these fish species. The construction of the RO plants required troves of groundwater. Desalinated water can also be acidic to both pipes and digestive systems.
- **Low Temperature Thermal Desalination (LTTD)** is one process that uses the availability of a temperature gradient between two water bodies or flows to evaporate the warmer water at low pressure and condense the resultant vapour with the colder water to obtain freshwater.
 - **Pros:** Better than the Desalination technique; simplicity of the LTTD process also enables to control the quality of product water in order to provide either good quality drinking water or boiler grade water as the situation warrants.
 - **Cons:** the LTTD technique draws power from diesel sets

The water crisis of India cannot be solved by just one type of solution. Thus, technology alone cannot be a panacea. There is a need for multi-pronged solution to tackle the crisis of water.

Other measures needed:

- India's priority must be:
 - To make our irrigation and water systems amenable to modern concepts.
 - To complete irrigation and water sector reforms.
 - To implement improved water management, governance and regulation practices.
 - Pricing system for water: For making people use water efficiently
- Deepen our understanding of our water resources and usage and put in place interventions that make our water use efficient and sustainable.
- Augmentation of watersheds that can store more good water, for use in agriculture and to serve habitations.
- Strict pollution control enforcement.
- **Decentralisation of irrigation commands**, offering higher financial flows to well-performing States through a **National Irrigation Management Fund**.
- Groundwater extraction patterns need to be better understood through **robust data collection**.
- Pollution can be curbed by levying suitable costs.
- Poor maintenance of pipelines, consistent leakage and illegal tapping of water are some of the issues that need to be addressed on a war-footing.
- Adopting rainwater harvesting techniques is the need of the hour.
- A legal mandate will work better than just competition and cooperation; it would make governments accountable.
- These forward-looking changes would need revamped national and State institutions, and updated laws.
- Urban India needs to focus on recycling and harvesting water, having better testing and purification facilities and increase public awareness on the need to conserve water.
- Large catchment areas need to be developed around water bodies so that natural recharge of groundwater takes place. A good example is the **Seog catchment area** which has been denoted as a wildlife sanctuary and where no construction is allowed.
- Greywater recycling, a method of recycling wastewater from kitchen sinks, showers and laundry fixtures.
- Greywater recycling helps reduce household water usage by about 50% .
- This year's World Water Development Report makes it clear that nature-based solutions which are also aligned with the principles and aims of the 2030 Agenda for Sustainable Development can offer answers to our most pressing water-related challenges.

Conclusion:

- There is a need for credible environmental and cumulative impact assessments, genuine public consultation process at multiple stages of planning and project implementation, confidence-inspiring appraisal, which

includes the appointment of independent experts, and most crucially, achieving some real monitoring and compliance.

- The **water governance** ought to be made **transparent, accountable and participatory** in every sub-sector, including management of rivers, groundwater, floods, and biodiversity, among others.

Extra information: Ancient Indians understood the art of water governance. Most of India's traditional water management has been at the community level; relying upon diverse, imaginative and effective methods for harvesting, storing, and managing rainfall, runoff and stream flow. Some of the traditional water conservation structures:

- **Phad** – It is a community-managed irrigation system in the Tapi river basin in Maharashtra. It starts with check dam built across a river and canals to carry water to agricultural blocks with outlets to ensure excess water is removed from the canals.
- **Zing** – It is found in Ladakh, are small tanks that collect melting glacier water. A network of guiding channels brings water from the glacier to the tank.
- **Kuhls** – They are surface water channels found in the mountainous regions of Himachal Pradesh. The channels carry glacial waters from rivers and streams into the fields.
- **Zabo or Ruza System**– It is practised in Nagaland. Rainwater that falls on forested hilltops is collected by channels that deposit the run-off water in pond-like structures created on the terraced hillsides.
- **Jackwells** – The Shompen tribe of the Great Nicobar Islands uses this system, in which bamboos are placed under trees to collect runoff water from leaves and carries it to jackwells which are pits encircled by bunds made from logs of hard wood.
- **Pat system** – It is developed in Madhya Pradesh, in which the water is diverted from hill streams into irrigation channels by diversion bunds. They are made across the stream by piling up stones and teak leaves and mud.
- **Eri** – It is tank system, widely used in Tamil Nadu which acts as flood-control systems, prevent soil erosion and wastage of runoff during periods of heavy rainfall, and also recharge the groundwater.
- **Johads** – They are small earthen check dams used to conserve and recharge ground water, mainly constructed in an area with naturally high elevation.
- **Panam keni** – The Kurumba tribe (a native tribe of Wayanad) uses wooden cylinders as a special type of well, which are made by soaking the stems of toddy palms and immersed in groundwater springs.
- **Ahar Pynes** – They are traditional floodwater harvesting systems indigenous to South Bihar. Ahars are reservoirs with embankments on three sides and Pynes are artificial rivulets led off from rivers to collect water in the ahars for irrigation in the dry months.
- **Jhalara** – Jhalaras are typically rectangular-shaped stepwells that have tiered steps on three or four sides in the city of Jodhpur.
- **Bawari** – Bawaris are unique stepwells that were once a part of the ancient networks of water storage in the cities of Rajasthan.
- **Taanka** – It is a cylindrical paved underground pit into which rainwater from rooftops, courtyards or artificially prepared catchments flows. It is indigenous to the Thar Desert region of Rajasthan.
- **Khadin** – Also called dhora, is a long earthen embankment that is built across the hill slopes of gravelly uplands. It is indigenous to Jaisalmer region and similar to the irrigation methods of Ur region (Present Iraq).
- **Kund** – It is a saucer-shaped catchment area that gently slopes towards the central circular underground well. It is found in the sandier tracts of western Rajasthan and Gujarat.

Q) Discuss the concept of community-based Disaster Management and highlight its principles and challenges. (250 words)

National policy on disaster management. IGNOU Notes on Disaster Management.

Why this question:

The question is directed to evaluate the significance of community-based Disaster Management.

Key demand of the question:

The answer must discuss in detail the community-based Disaster Management- its features, importance and challenges.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

**Structure of the answer:****Introduction:**

Begin with brief on what you understand by community-based Disaster Management.

Body:

Discussion should include the following:

Community-based disaster management (CBDM) is an approach to building the capacity of communities to assess their vulnerability to both human induced and natural hazards and develop strategies and resources necessary to prevent and/or mitigate the impact of identified hazards as well as respond, rehabilitate, and reconstruct following its onset.

Explain the principles of CBDM.

CBDM empowers communities to be pro-active in disaster management and creates a space for them to develop strategies on their own terms rather than waiting for already overstretched governments and NGO's.

Bring out associated challenges if any.

Conclusion:

Conclude with way forward.

Introduction:

Community-based disaster management (CBDM) is an approach to building the capacity of communities to assess their vulnerability to both human induced and natural hazards and develop strategies and resources necessary to prevent and/or mitigate the impact of identified hazards as well as respond, rehabilitate, and reconstruct following its onset. Simply put, the aim of CBDM is to

- reduce vulnerabilities and increase capacities of vulnerable groups and communities to cope with, prevent or minimize loss and damage to life, property, and the environment,
- minimize human suffering
- Hasten recovery.

Body:**Importance of CBRDM:**

- The same plan, regardless of the regional characteristics, is implemented or imposed everywhere.
- Local knowledge, experiences, skills, resources and techniques are not given due importance. Rather external resources and techniques are proposed to be utilized.
- Negligence about local cultural instincts and heritage.
- Prioritisation is decided by an outsider and not the stakeholders or the community itself.
- Local community does not have any information about the disaster management plans for their area and the role of different sectors in helping the community during disasters.

Advantages of CBRDM:

- Feelings of coordination and self belonging to the society are developed.
- Local geo-climatic and socio-cultural characteristics get attention of the people in development and disaster management.
- Local initiatives begin and community provides assistance to the executing agencies involved in disaster management.
- There is exchange of knowledge, information, skills and techniques between the community and the experts involved from outside.
- Community comes forward to put forward its ideas for selection of appropriate programmes suitable to their locality and society.
- Community can monitor the quality of works being done in its locality. It will also generate a sense of responsibility among the community.
- It will lead to capacity building of the community on issues of disaster-safe developmental activities.

Conclusion:

- There is a need for coordination in the Community-Based Approach among all the stakeholders.
- This bottom-up, participatory approach can make community members more receptive of new knowledge and information presented to them.

Q) Highlight development perspective to disaster management with focus on disaster management in riverine regions. (250 words)

National policy on disaster management. IGNOU Notes on Disaster Management.

Why this question:

The question aims to analyse the development angle possible in riverine regions that are hit by disasters.

Key demand of the question:

Explain in detail the development aspects associated with disaster hit region and in what way they are essential in overall development of the region.

Structure of the answer:

Introduction:

In brief explain the significance of development in disaster hit regions.

Body:

Explain that with the kind of economic losses and developmental setbacks that the country has been suffering year after year, it makes good economic sense to spend a little extra today in a planned way on steps and components that can help in prevention and mitigation of disasters, then be forced to spend many multiples more later on resto-ration and rehabilitation. The design of development projects and the process of development should

take the aspect of disaster reduction and mitigation within its ambit; otherwise, the development ceases to be sustainable and eventually causes more hardship and loss to the nation.

Quote a case study from recent times – Assam floods etc. to justify your answer.

Conclusion:

Conclude by suggesting way forward.

Introduction:

- India is vulnerable, in varying degrees, to a large number of disasters. Floods affect an average area of around 7.5 million hectares per year.
- According to the National Commission on Floods, the area susceptible to floods was estimated in 1980 to be around 40 million hectares and it is possible to provide reasonable degree of protection to nearly 80 per cent (32 million ha). Riverine flooding is perhaps the most critical climate-related hazard in India.

Body:

India's key vulnerabilities:

- Coastal states, particularly in the eastern coast and Gujarat on the west coast are vulnerable to cyclones.
- 4 crore hectare land mass is vulnerable to floods.
- 68% of the net sown area is vulnerable to drought.
- 55% of total area is in Seismic zones –III to V and vulnerable to earthquakes.
- Sub-Himalayan region and Western Ghats are vulnerable to landslides.

Disasters lead to enormous economic losses that are both immediate as well as long term in nature and demand additional revenues. Also, as an immediate fall-out, disasters reduce revenues from the affected region due to lower levels of economic activity leading to loss of direct and indirect taxes. In addition, unplanned budgetary allocation to disaster recovery can hamper development interventions and lead to unmet developmental targets.

With the kind of economic losses and developmental setbacks that the country has been suffering year after year, the development process needs to be sensitive towards disaster prevention and mitigation aspects. There is thus need to look at disasters from a development perspective as well.

Current institutional measures to tackle such incidences:

- The **National Cyclone Risk Mitigation Project (NCRMP)**, to be implemented with financial assistance from the World Bank, is envisaged to have four major components:
 - Component A: Improvement of early warning dissemination system by strengthening the Last Mile Connectivity (LMC) of cyclone warnings and advisories.
 - Component B: Cyclone risk mitigation investments.
 - Component C: Technical assistance for hazard risk management and capacity-building.
 - Component D: Project management and institutional support.
- These components are highly interdependent and have to be implemented in a coherent manner.

- In 2016, **National Disaster Management Plan** was unveiled to tackle disaster. It provides a framework to deal with prevention, mitigation, response and recovery during a disaster.
- The **NDMA** had come up with its **National Guidelines of Management of Cyclones in 2008**. The basic premise of these guidelines is that the mitigation has to be multi-sectoral.
- Developing Integrated Coastal Zone Management (ICZM) frameworks for addressing the sustainability and optimal utilisation of coastal resources as also cyclone impact minimisation plans.
- Ensuring cyclone resistant design standards are incorporated in the rural/ urban housing schemes in coastal areas
- **Implementing coastal flood zoning, flood plain development and flood inundation management and regulatory plans.**
- **Coastal bio-shields** spread, preservation and restoration/ regeneration plans.
- There is a need for **private sector participation in designing and implementing policies, plans, and standards.**
- Need of **Disaster Management program to be inclusive including women, civil society, and academia.**

Way forward:

- For addressing natural calamities such as floods and drought, there already exist a number of plan schemes under which a lot is being done and can be done.
- State Governments need to make full use of the existing plan schemes and give priority to implementation of such schemes that will help in overcoming the conditions created by the calamity.
- Reconstruction efforts must involve rebuilding in a better way. Climate proofing in Kerala calls for structures to be built with wind- and water-resistant materials.
- People need to relocate out of harm's way. During the 2015 floods, Chennai illustrated the price of unrestricted urban development.
- Early warning is vital. Because of investments in these systems, Cyclone Phailin (2013) claimed less than 40 lives in Odisha. In Kerala, there was no timely forecast from national weather services. The State needs a reliable flood forecasting capability.
- There needs to be tougher implementation of logging and mining regulations in fragile ecologies. Deforestation worsened the effects of Kerala's floods and mudslides, as the report of the Western Ghats ecology expert panel 2011 had warned.
- Non-structural measures for flood forecasting provide early warning in flood prone areas have proved to be successful for flood management. High-tech warning systems on the ground will not be useful until the authorities, key stakeholders and communities are trained to act upon the information obtained from these facilities.
- Different stakeholders need to come together for mapping risks, vulnerabilities, and resources, engage in regular preparedness actions like drills and capacity building, develop and update emergency plans, check the availability of resources at the local level and act upon early warning intimations.

Conclusion:

- India should prepare to mitigate and deflect the destruction caused by riverine floods. We need to employ technology, strict following of command structure and most importantly the participation and cooperation of local communities in the affected area.

Q) Discuss the role of Information Technology in disaster prevention. (250 words)

NIOS notes on disaster management

Why this question:

The question expects us to bring out the role of various facets of Information and technology in prevention of disasters as well as in managing the aftermath of disaster.

Key demand of the question:

The answer must talk about role played by technology in effectively managing and preventing disasters.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on what are disasters.

**Body:**

Discussion should include the following:

Define disaster management- e.g Disaster management is a systematic process with primary aim to reduce the negative consequences and effect of disasters, hence safeguarding people and social infrastructure.

Discuss in points, how big data can play a role in disaster management. E.g Big data generated from geo-informatics and remote sensing platforms can contribute to early warning systems for disasters. Geographical Information Systems (GIS), Global Positioning Systems (GPS) and environmental monitoring sensors with cloud services have a potential to predict disasters; Geoinformatics information along with transportation network data can benefit to understand human mobility patterns during disasters; social data sets; financial data sets etc.

Also discuss the role of internet etc. in disaster handling.

Conclusion:

Conclude with way forward.

Introduction:

- India is a large country and prone to a number of natural hazards. Among all the natural disasters that country faces, river floods are the most frequent and often devastating. The shortfall in the rainfall causes droughts or drought like stimuli in various parts of the country. The country has faced some severe earthquakes causing widespread damage to the life and property.
- India has a coastline of about 8000 km which is prone to very severe cyclonic formations in the Arabian Sea and Bay of Bengal. Another major problem faced by the country is in the form of landslides and avalanches.

Body:**The role of Information Technology in disaster prevention:****GIS AND REMOTE SENSING:**

- GIS provides a tool for effective and efficient storage and manipulation of remotely sensed data and other spatial and non-spatial data types for both scientific management and policy oriented
- This can be used to facilitate measurement, mapping, monitoring and modelling of variety of data types related to natural phenomenon.
- The specific GIS application in the field of Risk Assessment are Hazard Mapping to show earthquake, landslides, floods or fire hazards.
- Theses map could be created for cities, districts or even for the entire country and tropical cyclone Threat Maps are used by meteorological departments to improve the quality of the tropical storm warning services and quickly communicate the risk to the people likely to get affected by the
- eg.: GIS and Remote Sensing can be used for preparing seismic hazards maps in order to assess the exact nature of risks.
- GIS can be used in carrying out search and rescue operations in a more effective manner by identifying areas that are disasters prone and zoning them accordingly to risk magnitudes

INTERNET

- In the present era of electronic communication, the internet provides a useful platform for disaster mitigation communications.
- Launching of a well defined web site is a very cost-effective means of making an intra-national and international presence felt.
- It provides a new and potentially revolutionary option for the rapid, automatic, and global dissemination of disaster information. A number of individuals and groups, including several national meteorological services, are experimenting with the Internet for real-time dissemination of weather observation, forecasts, satellite and other
- In the most critical phase of natural disasters electronic communication have provided the most effective and in some instances perhaps the only means of communication with the outside world.

WARNING AND FORECASTING SYSTEM

- An advance system of forecasting, monitoring and issuing early warnings plays the most significant role in determining whether a natural hazard will assume disastrous proportions or
- Indian Metrological Department (IMD) provides cyclone warnings from the Area Cyclone Warning Centres (ACWCs) It has developed the necessary infrastructure to originate and disseminate the cyclone warnings at appropriate

- Seismological observations in the country are made through national network of 36 seismic stations operated by the IMD, which is the nodal
- Long term drought proofing programmes on the natural resources of the district have been greatly helped by the use of satellite data obtained by National Remote Sensing Agency.
- The drought assessment is based on a comparative evaluation of satellite observed green vegetation cover (both area and greenness) of a district in any specific time period by the National Agricultural Drought Assessment and Management System (NADAMS).
- Flood forecasts and warnings are issued by the Central Water Commission (CWC), Ministry of Water Resources. These are used for alerting the public and for taking appropriate measures by concerned administrative and state engineering agencies in the flood hazard

Conclusion:

- Advancement in Information Technology in the form of Internet, GIS, Remote Sensing, Satellite communication, etc. can help a great deal in planning and implementation of hazards reduction.
- For maximum benefit, new technologies for public communication should be made use and natural disaster mitigation messages should be conveyed through these measures.

Q) The ingenuity of the Coalition for Disaster Resilient Infrastructure (CDRI) clearly reflects India's commitment in promoting disaster resilient infrastructure and next major foreign policy innovation. Elucidate. (250 words)

Livemint

Why this question:

This article covers "Will India's idea on disaster management gain global support". It talks about the prospects of Coalition for Disaster Resilient Infrastructure. Indian Prime Minister, at the Hamburg G20 meet in 2017, proposed Coalition for Disaster Resilient Infrastructure (CDRI). It may be taken up at the G7 meet next month in Biarritz, where India has been invited by hosts France, along with Australia, Chile and South Africa.

Key demand of the question:

The answer must discuss the concept in detail and the significance of it in managing disasters.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Describe what is 'Coalition for Disaster Resilient Infrastructure'.

Body:

Each time a natural disaster occurs anywhere in the world, countries try to provide immediate relief, but there is no focus on building disaster-resilient Infrastructure.

In this context, Indian PM proposed CDRI which will act as a convening body that will pool best practices and resources from around the world for reshaping construction, transportation, energy, telecommunication and water, so that building in these core infrastructure sectors factors in natural catastrophes.

CDRI could fill this gap of funds and technology and help developing countries to build disaster-resilient Infrastructure.

For instance, India is a world leader in preventing human deaths due to disasters. The United Nations Office for Disaster Risk Reduction (UNISDR) has praised India's zero casualty approach and playing a pioneering role model for global community for drawing up a national and local strategy to reduce disaster losses and risks.

Conclusion:

Conclude that India's initiative for Coalition for Disaster Resilient Infrastructure will help in the development of appropriate infrastructure to face the least developed and developing countries with natural calamities.

Introduction:

- The **Coalition for Disaster Resilient Infrastructure (CDRI)**, as proposed by Indian Prime Minister, will act as a **convening body that will pool best practices and resources from around the world for reshaping construction, transportation, energy, telecommunication and water, so that building in these core infrastructure sectors factors in natural catastrophes.**

Body:

Need for CDRI:

- According to Sendai framework, every \$1 spent in disaster risk reduction leads to gain of \$7. But developing countries face the dilemma of balancing economic investment for development vs disaster resilient infrastructure.
- CDRI could fill this gap of funds and technology and help developing countries to build disaster-resilient Infrastructure.
- Suppose a disaster strikes a country, the affected nation could approach CDRI for technical and financial help, thus shielding it from excessive damage and devastation.
- **Post-calamity resuscitation and reconstruction** to strengthen local infrastructure and soften the blow of the next disaster, is a farsighted approach.
- It can only work if there is domestic political will, which is reinforced at the multilateral level through CDRI.

India's commitment in promoting disaster resilient infrastructure

- The Prime Minister pledged a funding of ₹480 crore (\$70 million) for CDRI in G20 summit in Osaka to promote the idea and invite greater international participation.
- India's initiative for Coalition for Disaster Resilient Infrastructure will help in the development of appropriate infrastructure to face the least developed and developing countries with natural calamities.
- CDRI could fill a real gap at a time when climate change-induced floods, cyclones and fires have multiplied in destructive force.
- For instance, India is a world leader in preventing human deaths due to disasters. The United Nations Office for Disaster Risk Reduction (UNISDR) has praised India's zero casualty approach and playing a pioneering role model for global community for drawing up a national and local strategy to reduce disaster losses and risks.

Foreign policy innovation:

- CDRI will boost India's soft power, but more importantly it has wider connotation than just economics, as synergy between disaster risk reduction, SDG and Climate Accord provides for sustainable and inclusive growth
- The United Nations Office for Disaster Risk Reduction (UNISDR) has praised India as a pioneering role model for drawing up a national and local strategy to reduce disaster losses and risks.
- If India is a world leader in preventing human deaths in disasters, it is not so adept in protecting property and infrastructure from extreme weather havoc. This is where CDRI is looking to tap into the expertise of Japan.
- CDRI will also complement India's efforts to bring together a coalition of countries harnessing solar power under the International Solar Alliance framework

Case Studies:

- Japan is prone to recurrent killer earthquakes, tsunamis and typhoons, but it has overcome these liabilities through improved building rules, stricter zoning laws and regulations since the 1980s, making it the world's safest and most disaster-resilient country.
- In Latin America, Chile has similarly learnt lessons from past catastrophes and drastically cut down casualties and losses from disasters through well-regulated building standards.

Conclusion:

- Each time a natural disaster occurs anywhere in the world, countries try to provide immediate relief, but there is no focus on building disaster-resilient Infrastructure. CDRI would help fill this gap and India can play a crucial role in setting a global example.

Q) In a large and diverse country like India, authorities are regularly confronted with large-scale protests, riots; incidents of mass civil disorder and crowd disasters. While keeping in focus the NDMA guidelines on Crowd Disaster Management, discuss the various issues faced by government. (250 words)

Reference

Why this question:

The question aims to analyse the disaster management in crowds and various issues faced by the government in dealing with the same.

Key demand of the question:

The answer must analyse what is crowd disaster management and provide for relevant discussions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what is crowd disaster management.

Body:

The discussion must cover the following aspects:

What are the different types of disasters associated with crowd ranging from stampede, fire incidences, floods etc.

Discuss the causes and consequences, suggest the framework provided by NDMA for crowd disaster management.

Conclusion:

Conclude with need for following best practices and rules and regulations in place.

Introduction:

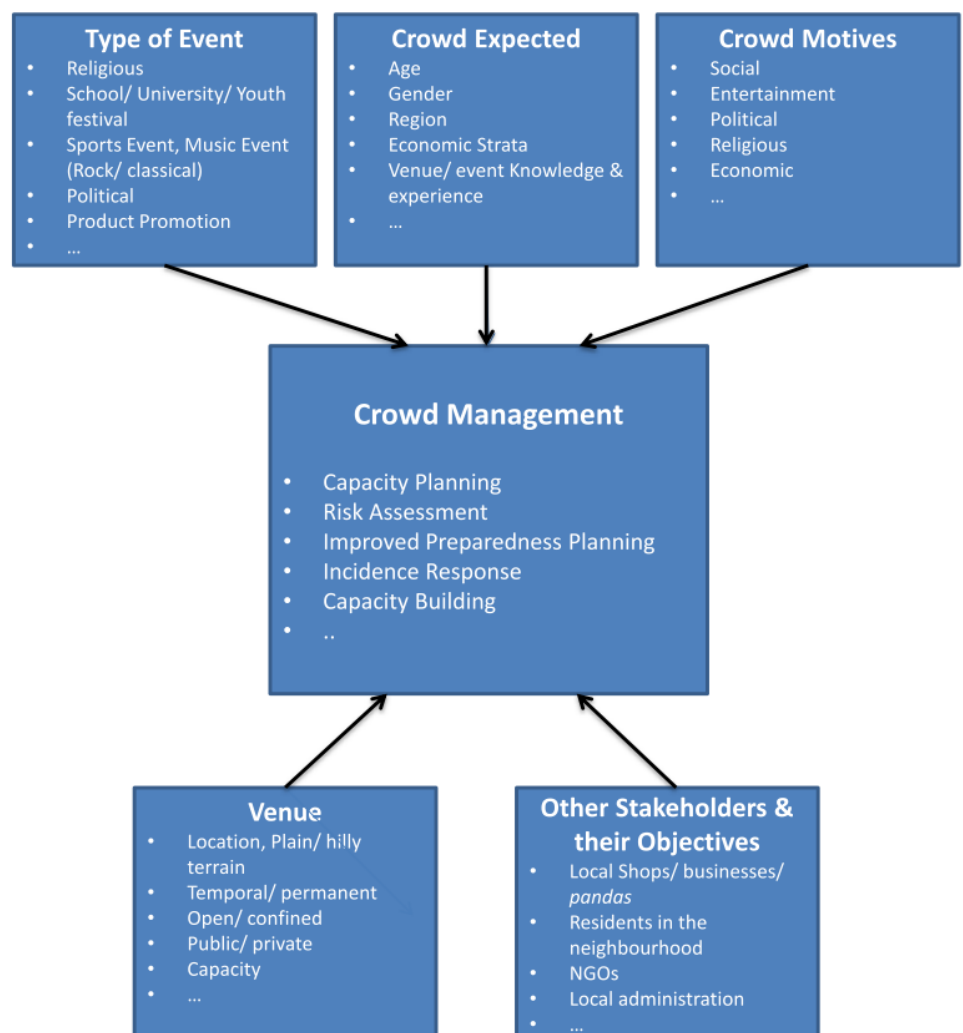

- Poor crowd management mechanism in India has lead to many unprecedented tragedies in India. From religious shrines to railway stations- frequent incidents of human stampedes are an unfortunate reality of Indian life.

Body:

- National Guide on Crowd Management-NDMA:** In view of the recurring stampedes at places of mass gathering, including religious places, and typically ad-hoc responses to those, the National Disaster Management Authority (NDMA) had prepared 'Suggestive Framework for Preparation of Crowd Management Plan for Events/Venues of Mass Gathering'.

Issues faced by Government:

- Governance and accountability:** There are lots of provisions in existing acts and rules for effective crowd management. However, enforcement and implementation are the key challenges faced by the administrator and law enforcement agencies. **g.:** Dabwali fire tragedy and Uphaar Cinema Tragedy are the typical examples of lackadaisical approach to crowd safety.

- **Poor infrastructure:** Lack of sufficient manpower in permit granting bodies, political pressure. Deployment of untrained security personnel in order to save cost.
- **No crowd management plan:** A major issue highlighted by recurring stampedes is the poor crowd management by concerned authorities. The state governments and local authorities have not yet implemented the NDMA guidelines on crowd management.
- **Rising population:** With rising population and rapid urbanization, urban areas are likely to be more susceptible along with places of frequent mass gatherings like temples.
- **Tolerance to crowd:** According to scholar Teresa Moore, large-scale events in India are more susceptible to stampedes because of a greater tolerance for high-density crowds. The higher tolerance for crowded places in India allows for more people to get closer, because they don't feel uncomfortable until it's very packed.

Measures needed: Some salient points from the NDMA guidelines are as follows:

- **Crowd Queues:** Initial focus should be on traffic regulations around the mass gathering venues. There should be a route map for venues along with emergency exits route maps. Also, there should be Barricade facility to control the movement of crowd queues. In case of large crowd gathering, there should be snake line approach, along with constant monitoring of crowds for developing hazard points.
- **VIPs:** There should be specific plans to handle VIPs and if VIPs add the security concerns then authorities should refuse entry to VIPs.
- **Communications:** There should be CCTV surveillance, along with another public address system, such as loudspeakers should be installed at all crowded points, in order to communicate with the crowds.
- **Medical facilities:** Ambulance and health care professionals should be available on venues. NDMA has recommended the medical first-aid rooms and emergency operations in order to handle post-disaster emergencies.
- **Basic facilities:** The venue Organisers should ensure authorised use of electricity, fire safety extinguishers and other arrangements as per the safety guidelines.
- **Civil society:** Police authorities should access the preparedness. Also, Event/venue managers should involve NGOs and civil society in traffic control, medical assistance and mobilization of local resources in case of disaster.
- **Capacity building:** In order to be proactive, there is need to focus on the capacity building. Also, the training manual should be periodically in order to usher in new crowd management technique. Apart from that if there is issue of insufficient Security personnel, students, NGOs and civil society should be roped in. Also, the media should be trained to manage communications during crowd disasters.
- **Use of technology:** Smart phones have been used to detect crowd dynamics such as pedestrian flows and bottlenecks, and social groups. Event/venue managers should get liability insurance for their visitors. Example, Shri Maa Vaishnodevi Shrine Board has insurance cover against any accidental casualty for visitors.
- **Awareness Generation Campaign:** A campaign to educate the public that railway tracks cannot be treated as commons, and vigorous enforcement, will reduce the probability of train related disasters like the Amritsar case.

Conclusion:

- In most of the cases, the crowd disasters are man-made disasters and such tragedies can be prevented with proactive planning and execution by the authorities involved.
- Apart from that lessons should be learnt from past mistakes. Every member of society is the stakeholder in such disaster prevention. NDMA should also focus on a central repository of incidences so that lessons can be learnt from past.

Q) Evaluate the relationship between Disaster and Development. To what extent this relationship is significant to policy makers? Discuss. (250 words)

Why this question:

The question seeks to evaluate the relationship between development and disasters.

Key demand of the question:

The answer must discuss the relationship between development and disasters and its significance to policy makers.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer:

Introduction:

Begin with brief that Development schemes can both increase and decrease vulnerability. In the traditional approach to disasters, the attitude was that the disasters, especially natural ones, were an act of god and as such were beyond human control; accepting death and damage to property was part of the costs.

Body:

Discussion should include the following:

What is the relationship between disaster and development?

How is development linked with disaster?

What is development disaster management?

What is disaster development nexus?

Conclusion:

Conclude with way forward.

Introduction:

- A disaster is an unforeseen event, which can overwhelm the capacity of the affected people to manage its impact. Disaster management efforts aim to reduce or avoid the potential losses from hazards, assure prompt and appropriate assistance to the victims of a disaster, and achieve a rapid and effective recovery.

Body:

- Disasters and development are closely linked. Disasters can both destroy development initiatives and create development opportunities. Development schemes can both increase and decrease vulnerability.

Disaster-Development

| | | Economic Development | Social Development |
|-----------------------------------|--|--|--|
| Disaster limits development | | Destruction of fixed assets. Damage to transport, communication, infrastructure. Erosion of livelihood. | Destruction of health or education infrastructure and personnel. Death, migration of key social actors leading to an erosion of social capital. |
| Development causes disaster risk | | Unstable development practices that create wealth for some at the expense of unsafe working or living conditions for others or degrade the environment. | Development path generating cultural norms that promote social isolation or political exclusion. |
| Development reduces disaster risk | | Access to adequate drinking water, food, waste management and a secure dwelling increases people's resilience. Trade and technology can reduce poverty. Investing in financial mechanisms and social security can cushion against vulnerability. | Building community cohesion, recognising excluded individuals or social groups, and providing opportunities for greater involvement in decision-making, enhanced educational and health capacity increases resilience. |

- Nations increase their capacities and decrease their vulnerabilities through development. Development planning is used by governments to draft plans to guide economic and social development. The concept of **sustainable development** is widely recognized by international agencies and by governments, although its definition is not universally agreed upon. Sustainable development is the outcome of comprehensive planning that incorporates considerations of disaster risk (reducing hazards and vulnerability) as well as strategies designed to protect the environment and to improve economic growth, levels of education, and living conditions of the entire population
- **The Sendai Framework for disaster reduction also focuses on development of Disaster Resilient Infrastructure, reducing the disaster risk, Building back better.**

**Conclusion:**

- The holistic approach to integrating disaster with development has been emphasized and practiced by policymakers and public managers of local communities.
- Disasters can be seen as a “**window of opportunity**” for development and **well-planned development** can certainly reduce impacts of disasters.

Case Study: Disasters can provide unique windows of opportunity in development. In the wake of the 1986 earthquake in El Salvador, the health sector took advantage of the severe damage to the large Children’s Hospital to restructure and decentralize services so that the nation would not be dependent on the services of one “megahospital.” The El Salvador earthquake also had extreme social and developmental consequences: scarcity of housing, high unemployment (26-35%), and a reduced capacity in public health facilities. Hurricane Joan, which ravaged the Atlantic coast of Nicaragua in 1988, also had serious effects on an already failing economy during a difficult political and economic period.

TOPIC: Linkages between development and spread of extremism; Role of external state and non-state actors in creating challenges to internal security.

Q) What is meant by radicalisation ? What are its types and how does India deal with radicalisation ? Discuss. (250 words)

[Timesofindia](https://www.timesofindia.com)

Why this question:

The question aims to analyse the concept of radicalization.

Key demand of the question:

Explain in detail the concept of radicalization, its types and in what way India deals with deradicalization.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In brief define radicalization.

Body:

Explain the context of question with the help of recent incidences, explain what are the different types of radicalization – Right-Wing Extremism, Politico-Religious Extremism, Left-Wing Extremism etc. Then discuss India’s efforts in this direction to deradicalize.

Conclusion:

Conclude that the problem of radicalization has seen an uptrend and in absence of any clear policy will continue to spread. It is important therefore to conduct meaningful research to aid the development of a framework that not only deals with de-radicalization but also rehabilitate the misguided youth of the nation.

Introduction:

- The word “radical” refers to **change in the fundamental nature of something**, thus Radicalism is **set of beliefs or actions of people who advocate thorough or complete political or social reform**.
- Radicalisation refers to the **process of an individual’s transformation from a moderate, law-abiding citizen into an active, anti-state, violent extremist**.

Body:**Types of Radicalisation:**

- **Right-Wing Extremism:** It is characterized by the violent defence of a racial, ethnic or pseudo-national identity, and is also associated with radical hostility towards state authorities, minorities, immigrants and/or left-wing political groups. E.g.: Ku Klux Klan in USA.
- **Politico-Religious Extremism:** It results from political interpretation of religion and the defence, by violent means, of a religious identity perceived to be under attack (via international conflicts, foreign policy, social debates, etc.). Any religion may spawn this type of violent radicalization. E.g.: ISIS using Islam as an alibi.

- **Left-Wing Extremism:** It focuses primarily on anti-capitalist demands and calls for the transformation of political systems considered responsible for producing social inequalities, and that may ultimately employ violent means to further its cause. It includes anarchist, Maoist, Trotskyist and Marxist-Leninist groups that use violence to advocate for their cause. E.g.: Naxalism in India.
- **Internet Radicalization:** Internet is used by terrorist as an effective tool for radicalisation and terror financing. Terror groups use the internet to advocate the use of violence to further a religious, ideological or political cause.

Steps needed to deal Radicalism in India:

- A **consistent counter radical strategy** is required to tackle radicalism.
- **Institutions have to be strengthened:** Educational and political institutions should be strengthened at ground level so that people of any state feel empowered. Also, enough number of job opportunities should be provided to people to decrease their chances of joining any radicalist organization.
- Central agencies like RAW, IB to play important role in covert operations to know the extremist propaganda and to inform the state special cell regarding the mechanism to regulate the actions of the radicalized youth.
- There should be sufficient evidence behind banning any organization. This is necessary to avoid court cases. Also, Intelligence Agencies, Law Enforcement Agencies and Judicial Courts need to act in unison on this matter.
- Once government identifies any radicalist organization, it needs to **take hold of their physical and financial resources**.
- **Countering activities of radicalists.** If hate can be taught, then love and social responsibilities toward people and the nation can also be taught. This is necessary to de-radicalize people.
- It needs to be ensured that people who been de-radicalized feel safe and secure in the country.
- The corner stone for radicalization is **poverty, deprivation and isolation and lack of employment and standard education opportunities, these to be addressed** by the government and policies to be formulated for inclusive participation and facilitation of all means for their development.
- **Political executive** plays an important role in drawing the youth into decision making and giving responsibility for the development of the community.
- **Social media to be regulated** when such info of such activities to be held and to draw a legalized guide lines to regulate in due means without contradicting the privacy of an individual.

Conclusion:

- Radicalisation is a danger to internal security and polarises the Indian society deepening the sectarian differences.
- Thus it is imperative to fight radicalisation on all fronts. Initiatives like UDAAN they must be inclusive in nature and drag youth from all sections, Nehru yuva kendra to be given impetus in such areas to involve youth in all capacity, cultural and sports activities so there are less chances for them to get influenced from such ideological goals.

Q) Do you agree that underdevelopment often creates the conditions for insurgency and spread of extremist ideologies among the people, who perceive that their needs are not being taken care of by the government ? Discuss in detail the linkage between development and spread of extremism. (250 words)

Reference

Why this question:

The question is based on the static portions of the GS -III paper, it aims to analyse the linkage between development and spread of extremism.

Key demand of the question:

The answer must analyse in detail the linkage between development and spread of extremism.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on extremism.

**Body:**

Explain how it is true that underdevelopment often creates the conditions for insurgency and spread of extremist ideologies among the people, who perceive that their needs are not being taken care of by the government. While it has been the policy of governments around the world today to emphasize on “inclusive development”, there are always groups in every state who feel alienated because they perceive that they are left out of the developmental efforts. Such perceptions coupled with inefficient and corrupt governance create an ideal condition for extremism and militancy. More than lack of development, it is the perception of injustice, misgovernance and inability of the system to engage the disaffected lot that lead people to violence and extremism.

Conclusion:

Conclude with way forward.

Introduction:

- Extremism can be defined as **any ideology considered to be far outside the mainstream attitudes of a society or to violate common moral standards**. It means an ideology deflected from the mainstream of common moral standards which can be perceived as good or bad depending upon the political and philosophical values.
- Improvement in standard of living is something that everyone craves for and deserves it too. It involves, apart from decent food clothing and shelter, quality education and health and also dignified living.

Body:**Causes for Extremism:**

- **Lack of governance:**
 - Governance is considered the most important issue as we lack a long term strategic perspective. Government has been giving more priority to Industrialization and less preference to development of tribal areas. Tribals have been denied their constitutional rights and justice.
- **Socio-economic issues:**
 - With regards to socio economic issues education must be the prime intervention and this needs to be addressed with innovation. Once education enters the blood stream of the people of particular region they would be discrete with their violent actions.
 - Most of these people who are entering into the movement of extremism are lacking primary education, basic amenities and infrastructure facilities.
- **Policing:**
 - Efficient and impartial policing is an important requirement of good administration. Weaker section of people does not have much faith in police.
 - People have no faith that justice will be done to them against the powerful person in the society. Here lies one of the attractions of the Naxalite movement and extremist thoughts.
- **Process of getting Justice:**
 - Frustrations have built among the society where disputes and conflicts are not settled in time. Today's judicial system is time consuming in nature. The parties to the dispute lose control over even the terms and details of the dispute once it goes to the court. This way the people minds are turning towards extremist thoughts.
- **Developmental issues related to rise and spread of extremism:** Developmental issues which pertain to the spread of extremism are linked to **lack of access to basic resources to sustain livelihood**.
 - **Forest policy:**
 - In the name of development, habitat of principal adivasi communities were declared reserve forests & in accordance with Forest conservation Act 1980, no forest land can be diverted to non forest use without permission
 - Rights of primitive forest dwellers were restricted resulting in losing access to land.
 - Mass resentment leading to extremist activities.
 - **Displacement & rehabilitation:**
 - Displacement/ forced eviction of people occur due to developmental projects such as irrigation, industrial projects, mining projects, power plants etc. It can be physical, emotional or cultural.
 - Tribal people are most prone to displacement because tribal areas are rich in mineral resources such as Orissa, Jharkhand. This impacts multidimensional trauma on them leading to serious consequences.

- **Labour, unemployment and wages:**

- Unemployment and insecurity of livelihood are growing source of dissatisfaction and anger among youth, both in urban and rural areas.
- Minimum wages for agriculture work are not implemented, increased share of unorganized workers in unorganized sector, no effective coverage of labour welfare laws.
- Hence this multifaceted form of exploitation in the absence of any developmental propaganda forms the major cause of spread of extremism.

Thus, the above causes show that underdevelopment and socio-economic lacunae lead to extremism.

- **Effective implementation of legislation:**

- PESA, MNREGA, Scheduled tribes and other traditional forest dwellers acts must be implemented effectively.

- **Land Related Measures:**

- A serious effort must be made to continuously implement the land ceiling issues for distribution amongst the most vulnerable section of the landless poor.
- Land should be acquired by government for SEZ by paying proper compensation to the farmers.
- Land tribunals or fast track courts must be set up for speedy disposal of land ceiling cases. The loopholes in the respective state ceiling laws must be corrected.

- **Basic amenities and Infrastructure:**

- Failure to provide infrastructure and services as per national norms is one of the much discriminatory manifestations of governance in extremism affected areas. Basic services to standards among the people in these areas to be given top priority.

- **Governance Issues:**

- Areas in central India where unrest is prevailing covers several states like Andhra Pradesh, Orissa, Chattisgarh, Madhya Pradesh, Jharkhand and parts of Maharashtra are manually administered.
- State interventions both for development and for law and order are fairly low. Local populations present in the tribal areas are being exploited by the armed and rich people. Government should taken necessary action in protecting these people.
- The basic steps required in the direction include establishment of credibility and confidence of government, keeping a continuous vigil for fulfilment of people's vision, effective protection, peace and good governance sustainable development with equity in tribal areas will make extremism low in tribal areas.

- **Livelihood Security:**

- should strengthen the subsidiary and supportive activities in horticulture, poultry, fisheries, animal husbandry under the strict guidelines of ministry of agriculture through establishment of quality infrastructure & efficient market linkages at the village level.
- Universalize basic social services to standards amongst the people of extremist affected areas so that the discriminatory manifestations of governance can be removed.

- **Institutional arrangements for centre-state cooperation:**

- Since problems in formulating a counter-Extremist policy as well as in dealing with the issue on a day-to-day basis are sourced to the lack of centre-state cooperation, a permanent institutional mechanism in the form of a coordination centre can be established to thrash out emerging differences.
- A coordination centre does currently exist within the MHA, but requires the active participation of state representatives to ensure smoother coordination

Conclusion:

- Inequalities between classes have increased over the years which act as source of unrest. **Indian Constitution in article 39** mandates states to prevent concentration of wealth in few hands but policy makers often ignore this resulting into two dimensions: BHARAT and INDIA.
- Only when adivasis and marginalized groups are taken care of both these worlds won't merge. Structural violence causes much of violence. While not condoning radical violence, an honest response to extremism therefore must begin by ameliorating the structural violence in the society.

Way forward:

- Strengthening of local self govt with additional financial and decision making power would promote development by making them stakeholders in development.
- A majority of adivasis are uneducated, education can help them to demand their rights and fight for them.

- Apart from this, discrimination related to residence, food, clothing, marriage and employment must be removed.
- Roping in more NGOs and other groups that work with these tribals to help them get more skills and opening new vistas of employment based on their skills can help nip alienating feeling among them.
- Land reforms in letter and spirit granting right of land to the tiller can root out long standing dissatisfaction among the tribals.

Q) The main support for the Naxalite movement comes from Dalits and Adivasis. Discuss the correspondence and linkages of the social conditions of these communities of the population and Naxalism of a particular region. (250 words)

Reference

Why this question:

The question aims to establish the interlinkages between the communities of Dalits and Adivasis with Naxal movements of the country.

Key demand of the question:

The answer must discuss and establish the relation between the presence of such communities and the Naxal establishments of a region.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on Naxal reach and expanse in the country.

Body:

Discussion should include the following:

Discuss the double tragedy at work in tribal India; The first tragedy is that the state has treated its Adivasi citizens with contempt and condescension. The second tragedy is that their presumed protectors, the Naxalites, offer no long-term solution either.

Explain the plight of thousands of tribals and Dalits in India.

Discuss that plethora of constitutional provisions are in place to protect the Scheduled Castes and Scheduled Tribes, and yet, in practice no SC/ST law comes to their rescue or penalizes the culprits.

Conclusion:

Conclude with way forward and suggest what needs to be done.

Introduction:

- Dalits and adivasis comprise about one-fourth of India's population: Dalits constitute 16 per cent and Adivasis 8 per cent. Most of them (80 percent of Dalits and 92 percent of Adivasis) live in rural areas. High levels of rural poverty therefore, are likely to indicate high distress among SCs and STs.
- Bihar, Orissa, Madhya Pradesh, Uttar Pradesh and West Bengal are the States with highest rural poverty, and they also account for a high proportion of SC and ST poor.

Body:

Socio-Economic Conditions:

1. Dalits:

They continue to face wide-ranging economic, social disadvantages, and day to day humiliation and degradation, denial of justice and violent atrocities in India.

- **High poverty:** In 2004/05, the proportion of SCs below the poverty line was as high 8 per cent in rural and 40% in urban areas.
- **Low education:** Dalits had been excluded from the education system for centuries. In the post-independence period educational opportunities have slowly opened up for them, but education levels continue to be very low among Dalits and the gap between Dalits and non-Dalits remains very
- **Limited employment opportunities:** most Dalits live in rural areas. The incidence of landlessness is higher among the SCs than among the The persistently high poverty of SC households is closely associated with low levels of ownership of capital assets like land, low levels of education and considerably lower diversification of avenues of employment.

- **Political marginalisation:** dalits have often had to struggle in order to assert this right and struggle again to demand accountability from the elected. The reins of power have remained with the dominant sections of society, whether it be the upper castes or in recent years the middle castes.
- **Social discrimination:** Dalits continue to face many kinds of social discrimination, related for instance to residence, food, clothing, marriage and employment.

2. Tribals:

- Apart from poverty and deprivation in general, the causes of the tribal movements are many: the most important among them are absence of self governance, forest policy, excise policy, land related issues, multifaceted forms of exploitation, cultural humiliation and political marginalisation.
- Land alienation, forced evictions from land, and displacement also added to unrest. Failure to implement protective regulations in Scheduled Areas, absence of credit mechanism leading to dependence on money lenders and consequent loss of land and often even violence by the State functionaries added to the problem.

Thus, the above causes show that underdevelopment and socio-economic lacunae lead to extremism.

- **Effective implementation of legislation:**
 - PESA, MNREGA, Scheduled tribes and other traditional forest dwellers acts must be implemented effectively.
- **Land Related Measures:**
 - A serious effort must be made to continuously implement the land ceiling issues for distribution amongst the most vulnerable section of the landless poor.
 - Land should be acquired by government for SEZ by paying proper compensation to the farmers.
 - Land tribunals or fast track courts must be set up for speedy disposal of land ceiling cases. The loopholes in the respective state ceiling laws must be corrected.
- **Basic amenities and Infrastructure:**
 - Failure to provide infrastructure and services as per national norms is one of the much discriminatory manifestations of governance in extremism affected areas. Basic services to standards among the people in these areas to be given top priority.
- **Governance Issues:**
 - Areas in central India where unrest is prevailing covers several states like Andhra Pradesh, Orissa, Chhattisgarh, Madhya Pradesh, Jharkhand and parts of Maharashtra are manually administered.
 - State interventions both for development and for law and order are fairly low. Local populations present in the tribal areas are being exploited by the armed and rich people. Government should taken necessary action in protecting these people.
 - The basic steps required in the direction include establishment of credibility and confidence of government, keeping a continuous vigil for fulfilment of people's vision, effective protection, peace and good governance sustainable development with equity in tribal areas will make extremism low in tribal areas.
- **Livelihood Security:**
 - should strengthen the subsidiary and supportive activities in horticulture, poultry, fisheries, animal husbandry under the strict guidelines of ministry of agriculture through establishment of quality infrastructure & efficient market linkages at the village level.
 - Universalize basic social services to standards amongst the people of extremist affected areas so that the discriminatory manifestations of governance can be removed.
- **Institutional arrangements for centre-state cooperation:**
 - Since problems in formulating a counter-Extremist policy as well as in dealing with the issue on a day-to-day basis are sourced to the lack of centre-state cooperation, a permanent institutional mechanism in the form of a coordination centre can be established to thrash out emerging differences.
 - A coordination centre does currently exist within the MHA, but requires the active participation of state representatives to ensure smoother coordination

Conclusion:

- Inequalities between classes have increased over the years which act as source of unrest. **Indian Constitution in article 39** mandates states to prevent concentration of wealth in few hands but policy makers often ignore this resulting into two dimensions: BHARAT and INDIA.

- Only when Adivasis and marginalized groups are taken care of both these worlds won't merge. Structural violence causes much of violence. While not condoning radical violence, an honest response to extremism therefore must begin by ameliorating the structural violence in the society.

Q) North-East suffers from violent movements based upon ethnic identities leading to clashes. Discuss the role played by Non-state actors in leading to the current conditions of the region. (250 words)

Reference

Why this question:

The question aims to analyse the insurgency situations often witnessed by the North east region owing to the role played by non-state actors.

Key demand of the question:

The answer must discuss the insurgency in north east prevalent due to non-state actors.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief upon the situation in north east states.

Body:

Discussion should include the following:

Explain the existing situation, trace the historical factors responsible for the uprising of insurgency, rise of non-state actors, role played by them.

Then explain what should be the role of the government in overcoming the challenges, discuss policies and schemes in place to address the situation.

Conclusion:

Conclude with way forward.

Introduction:

- Due to its distinct socio-cultural background and particular historical evolution, the North-East region of India holds several fault lines around which many non-state actors have been thriving for a very long time.

Body:

The **role played by Non-state actors** in leading to the current conditions of the region:

- This region has been one of the **most neglected regions in terms of developments** and is the main cause behind the resentment of the people living in this area. The insurgent groups take advantage of resentment of people and get support base.
- **Alienation of population from mainstream political process**, where the insurgent group continue to boycott the dialogue and electoral process. E.g.: NSCN-Khaplang group.
- Active and covert foreign support to these insurgent groups, through training, logistic and moral support has also been a big hurdle to eradicate these groups. China is alleged to support such acts for instance . ULFA members of Assam were given shelter by China.
- **Non state actor -sponsored terrorism**, often motivated by fundamentalist ideologies, backed by secretive but efficient financial networks, use of IT, clandestine access to chemical-biological and nuclear materials, and illicit drug trafficking, has emerged as a major threat to international stability.
- They **bring fake currency** to India and try to hit Indian economy. E.g.: India Bangladesh border
- They **smuggle weapons, drugs into India**, directly targeting the youth
- Extremist non state actors also include religious fanatics which propagate religious hatred which can led to **communal tensions** in the country.
- They also incite people for regionalism thus demanding their separate state which further **increases secessionist tendencies**.

Measures needed:

- Thorough background check of all insurgents groups should be carried out before the central government enters into any Ceasefire or Suspension of Operations Agreements with the insurgents.
- Political solutions to the Assam problem should be discussed openly as widely as possible to avoid backlash from the tribal and the minority population of the state.

- Focus of the Ministry of DoNER and NEC should be on investment in mega-projects which will make big difference to the development of the region.
- Institutional capacities in the North east should be developed urgently.
- Pragmatic land use policy should be formulated for attracting industries in the region. Micro, small and medium enterprises should be encouraged.
- Greater awareness about the Look East Policy and its benefits to the North East should be generated among the policymakers and the intelligentsia of the region.
- Ties with Myanmar should be deepened by exploiting Myanmar's anxieties about China as well as existing deep civilization and spiritual ties.
- The North East region must be included in the India-ASEAN Vision for trade and cooperation. Development Plan for the North East should factor India-ASEAN strategic cooperation.
- Special economic zones along India-Bangladesh border, especially in Meghalaya and Assam should be set up.

Q) In what way external state and non-state actors create problems to India's internal security ? Discuss. (250 words)

Ethics by Lexicon publications

Why this question:

The question is direct from the static portions of GS paper III.

Key demand of the question:

Explain in detail the role of way external state and non-state actors and in what way they pose threat to the internal security of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define who are external state and non- state actors.

Body:

Explain that India has been facing challenges on the front of internal security since independence from various state and non-state actors. Politico-social and economic sphere of sovereign state has been controlled by the popular elected government. But peace and security can be disturbed by some external and non-state actor, through various means and ways.

Discuss who are state and non-state actors, what are the various challenges posed by them for the Indian internal security.

Conclusion:

Conclude by stating what needs to be done to overcome the challenges.

Introduction:

- India has been facing challenges on the front of internal security since independence from various state and non state actors. **External State actors** refer to those entities which have formal backing of a sovereign state for carrying out any intended action.
- **Non state actors** on the other hand, have a considerable power of influencing international events but they do not have formal state backing. Examples of state actors are the army, bureaucracy, intelligence agencies etc. whereas non state actors would be NGOs, civil society organizations, extremist outfits, multinational companies etc.

Body:

External State actors are responsible for posing a challenge to internal security in multiple ways:

- Countries surrounding India have been active in exploiting the volatile situation presented by the turmoil in the northeast. Not only countries such as China, Pakistan, Bangladesh and Myanmar, but also smaller powers such as Bhutan and Nepal have been involved in the region.
- Through **political backing, economic assistance, logistic support, military training or arms** supplies these countries have varyingly contributed to the ongoing violence in this region.
- The state may carry out a **limited war against Indian state** and this might have ramifications for our internal security too

- They might **support the various insurgent groups, Naxalites, or separatist groups** through funding, training or logistics
- There have been instances where state actors have been responsible for carrying out **cyber warfare** through **hacking and other espionage**.

Non state actors however have played their nefarious role too in creating problems for India:

- **Insurgency:**
 - North-East suffers from violent movements based upon ethnic identities leading to clashes. China is alleged to support such acts for instance. ULFA members of Assam were given shelter by China.
- **Terrorism:**
 - Pakistan has been a major exporter of terrorism to India. Non-state actors like terrorist groups for instance Lashkar-e-Taiba, Jaish-e-Mohammad are a continuous threat.
 - **Non state actor -sponsored terrorism**, often motivated by fundamentalist ideologies, backed by secretive but efficient financial networks, use of IT, clandestine access to chemical-biological and nuclear materials, and illicit drug trafficking, has emerged as a major threat to international stability.
 - These groups aim to not only create instability in states like J&K, they also have a larger aim of destabilising the country. This is done through sporadic terrorist strikes, which spreads terror and panic. This could also adversely affect the ability of the Indian state to pursue economic modernisation.
- **Naxalism:**
 - Left wing extremism affects states like Chhattisgarh, Jharkhand and West Bengal.
- **Drug trafficking:**
 - Inter and Intra state trafficking takes place, through golden crescent and golden triangle routes.
 - Drugs from **Golden Crescent** (Pakistan, Afghanistan and Iran) have affected Punjab and **Golden Triangle** (Laos, Myanmar and Thailand) has affected North Eastern states.
- **Human-trafficking:**
 - Children and women trafficking takes place via Bangladesh and Nepal.
- **Counterfeit currency:**
 - It corrodes economy from inside, by facilitating black money and money laundering activities as well as funding terrorism, which itself creates a demand for fake currency, thereby creating a positive feedback loop. This is the issue arising especially from Pakistan.
- **Communalism:**
 - Propagandas are run and funded by enemy country and other **non-state actors (NGOs and CSOs)** to destabilize India by damaging the socio-religious fabric and ensure riots.
- **Cyber Security:**
 - Recent cyber-attacks by Legion, ATM skimming are examples. Pakistani hackers often hack government websites.
- They can also incite people for regionalism thus demanding their separate state which further increases secessionist tendency

Conclusion:

- Both state and non state factors from outside have created problems in our internal security framework. Hence while it is imperative to guard our borders and strengthen our diplomacy, on the other hand, we need to check the various non state actors who come in hidden forms. There is a need for a **national internal security doctrine** to deal with various challenges.

Topic: Various Security forces and agencies and their mandate.

Q) Discuss the mandate of National Investigation Agency (NIA), What are the impediments in its operative functioning ? How can these concerns be addressed ? Elucidate. (250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

Lok Sabha recently passed the NIA Act Amendment Bill, which gives more powers to the National Investigation Agency and extends its jurisdiction beyond India's borders. The Bill was hotly debated, with the Opposition accusing the government of misusing the agency for political vendetta and turning India into a police state.

Key demand of the question:

Answer must discuss the key mandate of NIA, impediments in its operative functioning and in what way these impediments can be overcome.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the background of the question, why was NIA in news etc.

Body:

Discuss the following aspects in the answer:

Explain the proposed amendment to the National Investigation Agency (NIA) Act-2008 that were passed – aims to provide the probe agency with powers to investigate scheduled offences such as human trafficking; circulation of fake currency; manufacture and sale of prohibited arms; and cyber-terrorism. It also allows for the creation of special courts for adjudicating such crimes.

The bill also seeks to allow the NIA jurisdiction over scheduled offences committed outside India, subject to international treaties and the domestic laws of other countries. A special court in New Delhi will preside over such cases etc.

Then discuss what are the issues involved and how they need to be addressed.

Conclusion:

Conclude with a way forward, signifying its importance.

Introduction:

- The National Investigation Agency (NIA) was set up in 2009 under the NIA Act, 2008. It was set up in the wake of the Mumbai terror attack. At present, NIA is functioning as the Central Counter Terrorism Law Enforcement Agency in India.
- The Lok Sabha recently passed the National Investigation Agency (Amendment) Bill, 2019 which enhances the jurisdiction and powers of NIA. The amendments will allow NIA to probe cybercrimes and cases of human trafficking.

Body:

Mandate of NIA:

- It aims to be a thoroughly professional investigative agency matching the best international standards at the national level, by developing into a highly trained, partnership-oriented workforce.
- It aims to discourage the existing and potential terrorist groups/individuals.
- It aims to develop as a storehouse of terrorist related information
- The agency aims to match the best international standards in counter terrorism and other national security related investigations at the national level by developing into a highly trained, partnership oriented workforce.

Impediments in its operative functioning:

- As most of terror attacks originate outside India, NIA faces hindrance in that regard.
- Due to law and order being state subject, NIA has faced coordination issues with regards to state police.
- Quality manpower is a constant challenge, especially with regards cyber attack capabilities.
- With regards to tech, it is dependent of foreign imports.
- There are no dedicated officers; the officers are recruited from Central State police, Central armed police forces on deputation.
- Lack of coordination mechanism with other specialised agencies like RAW, IB, State police etc. E.g.: Confusion during Pathankot attacks
- Lack of experts to deal with the cybercrimes.
- Lack of financial autonomy.

Measures needed:

- Granting of financial autonomy similar to CAPF.
- Although special courts will speed up judgments but filling up the vacancies of judiciary is a challenge in present times.
- To investigate cyber-crimes, need skilled manpower and ethical hackers.
- As many experts recommend, it is time for India to have a documented national security doctrine

- The doctrine should be accompanied by a security strategy that should spell out the state response to various kinds of security challenges.

Conclusion:

- Dealing with the menace of terrorism would require a comprehensive strategy with involvement of different stakeholders, the Government, political parties, security agencies, civil society and media.
- There is a need for National Counter Terrorism Centre. A centrally co-ordinated Terrorism Watch Centre, which could also operate as a think tank with sufficient inputs from academic and private experts.

Q) What do you mean by 'white collar crimes' ? If poor and illiterate are more vulnerable to be corrupt, why do the rich and educated people become corrupt ? Suggest measures to stop corruption by the rich and educated people ? (250 words)

Ethics by Lexicon publications

Why this question:

The question is based on the theme of corruption and in what way it is beyond the lines of poor or rich.

Key demand of the question:

Explain in detail with examples how corruption need not always be driven by poverty or un-educatedness rather it is often the manifestation of lack of right values and morals in individuals.

Structure of the answer:

Introduction:

In short explain the prevalence of corruption among rich and poor.

Body:

Discuss with suitable examples how corruption is rampant even among the rich and educated. The question can be best explained with examples where it is evident that the rich and literate have indulged in corruption by compromising on values and morals.

Conclusion:

Conclude with what needs to be done.

Introduction:

- White-collar crime refers to financially motivated nonviolent crime committed by business and government professionals. Within criminology, it was first defined by sociologist Edwin Sutherland in 1939 as "a crime committed by a person of respectability and high social status in the course of his occupation".
- Typical white-collar crimes could include fraud, bribery, Ponzi schemes, insider trading, labour racketeering, embezzlement, cybercrime, copyright infringement, money laundering, identity theft, and forgery. E.g.: Nirav modi scam, Vijay Mallya scam, Harshad Mehta scam etc.

Body:

Rich people become corrupt due to:

- **Greed:** The people who usually commit these crimes are financially secure.
- **Materialism:** Driven by motive of material pleasures, they are willing to take any crooked means.
- **Lack of Respect:** Disregard and ignorance for laws as they think they are above laws.
- **Power:** Legislators and the law implementers belong to the same group or class to which these occupational criminals belong;
- **Financial or physical duress.**
- The emergence of **cutting edge technology**, growing businesses, and political pressures has opened up new avenues for these criminal organizations to prosper.
- This increase is due to a **booming economy and technological advancement such as the Internet and fast money transfer systems.**
- **Law enforcement is sometimes reluctant** to pursue these cases because they are so hard to track and investigate.
- It is **very difficult to detect as white collar crimes always committed in privacy** of an office or home and usually there is no eyewitness.

Measures needed:

- Strengthening the implementation of laws like **Fugitive Economic Offenders Act, Benami Transactions act, Prevention of Money laundering act etc.**

- **Special Tribunals** should be constituted with power to award sentence of imprisonment upto 5 years for white-collar crimes. Convictions should result in heavy fines rather than arrest and detention of white-collar criminals.
- **Strengthening Corporate Governance** by implementing the measures suggested by Uday Kotak panel.
- **Increasing the democratic nature of the company** by improving transparency and accountability through audits, tax measures etc.
- **Creating public awareness** against these crimes through the media of press, and other audio-visual aids and legal literacy programmes.
- **Public vigilance** seems to be corner-stone of anti-white-collar crime strategy. Unless people strongly detest such crimes, it will not be possible to contain this growing menace.

Conclusion:

- Our social system is corrupted by number of white collar crime and it is a great challenge for us to discover suitable resolution to the increasing menace of white-collar crime.
- These crimes are directly affecting the economy of the nation and the public's confidence, therefore corrective action must be taken immediately for preventing, detecting, investigating, and prosecuting economic crimes in order to minimize their outcome.
- The provisions of Indian Penal Code dealing with white-collar crimes should be amended to enhance punishment particularly fine in tune with changed socio-economic conditions.

SECURE SYNOPSIS **MAINS 2019**

GS- 3

AUGUST 2019

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

The tragic death of Café Coffee Day's founder V.G. Siddhartha earlier this week has a wake-up question for our Startup nation, do you think the system is treating our entrepreneurs fairly? Critically examine. (250 words)

Livemint

Why this question:

CCD is a big brand and Siddhartha's untimely demise reflects poorly on the prevailing business atmosphere, replete with "pressures" mentioned in a letter to the board of CCD and its employees.

Key demand of the question:

The answer must evaluate the atmosphere in the country that is made available to the entrepreneurs.

Directive:

Critically examine – When asked to examine, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Discuss the importance of entrepreneurs for the economy in general.

Body:

The answer should mainly talk about the factors of ease of doing business in India. To what extent India has a conducive atmosphere for entrepreneurs.

Throw light on the case of CCD, what must have gone wrong, what are the possible corrections government can take to prevent such incidences.

Conclusion:

Conclude by suggesting way forward.

Introduction:

India recently raised to 77th position in the World Bank's Ease of Doing Business report rankings. However, the ground reality remains different with a lot of unease for doing business. CCD is a big brand and Siddhartha's untimely demise reflects poorly on the **prevailing business atmosphere, replete with "pressures"** mentioned in a letter to the board of CCD and its employees.

Body:

State of India's business atmosphere:

- Foreign investors, Indian entrepreneurs and corporations still find themselves stuck in archaic laws and regulatory red tape.
- Clarity is lacking and piecemeal amendments made to laws haven't helped.
- Major legislative reforms have taken place, led by the goods and services tax (GST) and the new insolvency law, but these, too, have struggled to make a difference due to problems in their implementation.

- Important concepts for Merger and acquisition deals remain shrouded in legalese-driven ambiguities. This pushes Indian entrepreneurs and companies back, despite India jumping 30 places last year in the World Bank's ease of doing business rankings.
- As per the World Bank, the enforcing contracts indicator measures the time and cost for resolving a commercial dispute through a local first-instance court (competent court), and the quality of judicial processes index, evaluating whether the country has adopted a series of good practices that promote quality and efficiency in the court system. India ranks very low in this.
- India's ranking in the 'enforcement of contract' component is 164. The report says that it takes an average of 1,445 days (or nearly four years) to enforce a contract in India. In this, the distance to frontier (DTF) ranking score is 40.76. The all-told cost to a litigant to recover amounts legitimately due to him is 31% of the value of the claim.
- The judiciary in India is already plagued with pendency of cases and case disposal is slow due to multiple factors like: More appeals; Low judges to cases ratio; Lack of modernisation of courts
- Plenty of grey areas exist, especially on tax matters. Guilt in many cases is a matter of legal interpretation. Such nuances tend to be lost on the public at large, all the more so after the past few years' uproar over black money and unpaid corporate loans.
- Society should change the way it treats entrepreneurs and they should not be called thieves, etc. without proof or substantiation.
- There is a broad anxiety over the vilification and worse that faltering firms and their promoters are often put to by an insensitive financial system.

Measures needed:

- Government is taking measures like Parliament even passed the Commercial Courts, Commercial Division and Commercial Appellate Division of High Courts Act.
- Labour laws should foster an enabling environment so far as employment practices are concerned.
- Faster reforms in the power sectors, facilitation of entry and exit of firms, level playing field for small and large firms, improvement in access to finance will lead to improvements in ease of doing business norms.
- To secure changes in the remaining areas will require not just new laws and online systems but deepening the ongoing investment in the capacity of states and their institutions to implement change and transform the framework of incentives and regulation facing the private sector. India's focus on 'doing business' at the state level may well be the platform that sustains the country's reform trajectory for the future.
- For attracting new investment, both foreign and domestic, several macroeconomic issues have to be addressed. These include political and economic stability, law and order maintenance, quality physical infrastructure, and buoyancy in financial markets.

- For the tax regime to be effective, India would do well to follow the due, and fair, process of law, especially when the offender is an entrepreneur. Our law enforcers and society will also have to re-examine their attitudes towards business.

Conclusion:

India is at crossroads where it now has to cater to the aspirations of a billion people. Existing frameworks can prove to be inadequate and there is a great need to leverage a billion minds and become a global power. Startups and entrepreneurship is the best way forward in becoming a knowledge superpower.

“Stagnant wages and jobless growth have become a recipe for political instability in the Indian countryside”, Critically analyse the statement in the backdrop of declining availability of jobs in the Indian economy.(250 words)

Livemint

Why this question:

The article talks about the employment picture and state of Jobs in the country.

Demand of the question:

The answer has to evaluate How serious is the employment problem in India.

What are the issues of economy with respect to jobs and employment scenario?

Directive word:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Discuss by quoting facts and highlight the issue.

Body

The article discusses in detail in what way stagnant wages and jobless growth are a recipe for political instability in the Indian countryside.

Take hints from the article and discuss the issues associated and what are the possible solutions/fixes to the same.

Conclusion

Conclude with way forward.

Introduction:

Unemployment has become a chronic problem of India and in the recent years the situation has only worsened. The National Sample Survey Office’s (NSSO’s) report, “**State of Working India, 2018**” data shows a record spike in unemployment in 2017-18. The overall unemployment was at a 45-year high, with youth between the ages of 15 and 29 facing higher rates of joblessness than others

Body:

State of Unemployment in India:

- CMIE database on “**Unemployment Rate in India**” is based on the panel size of over 1,58,000 households in the country.
- The unemployment rate in December 2018 rose to 7.38% from 6.62% in November 2018 and 4.78% in December 2017, highest since September 2016 when it stood at a high of 8.46%, the CMIE data showed.
- The total number of people employed fell by about 1.09 crore, about 83% or 91.4 lakh jobs were lost in rural areas.
- There has been a decline in the estimated Labour Participation Rate— the proportion of working-age people who are willing to work and are either actually working or are actively looking for work, in line with a fall in the unemployment rate.
- The estimated labour participation rate also dropped from 43.57 in December 2017 to 42.47 in December 2018. The rate was at 45.15 in December 2016 and at 47.84 in September 2017, the data showed.

The **reasons for issue of unemployment** in contemporary India:

- The labour force is the sum of the employed and those unemployed who are seeking employment.
- A shrinking of the labour force is most unusual in an economy with a growing population, and thus a growing working age cohort.
- **Low education and lack of skills** lead to loss of many job opportunities.
- **Discouraged-worker effect:** A section of those hitherto willing to work may have simply dropped out of an already challenged labour market.
- **Demonetization** has caused demoralisation among a section of the already unemployed who may have given up all hope of finding employment.
- About **90% of Indian Workforce is in the unorganized sector** which was majorly affected during Demonetization and GST introduction.
- **Declining Capital formation** which is not backed by Public and Private Investment.
- **Low female LFPR to the tunes of 24%** also adds to high unemployment rate.
- **Automation and IR4.0** is a looming threat to many jobs which have repeated work or sequential work.
- Socially disadvantaged groups do not get enough exposure in the job market like the general castes and Other Backward Classes.
- Labour laws in India are complex and relatively strict. Employment protection legislation is restrictive, compared with other emerging economies and OECD countries. Thus, corporates in

India tend to rely more on **temporary contract labour**, stay small or substitute labour for capital to avoid strict labour laws.

Impacts:

- The problem of unemployment gives rise to the problem of poverty.
- Young people after a long time of unemployment indulge in illegal and wrong activities for earning money. This also leads to increase in crime in the country.
- Unemployed persons can easily be enticed by antisocial elements. This makes them lose faith in democratic values of the country.
- It is often seen that unemployed people end up getting addicted to drugs and alcohol or attempts suicide, leading losses to the human resources of the country.
- It also affects economy of the country as the workforce that could have been gainfully employed to generate resources actually gets dependent on the remaining working population, thus escalating socioeconomic costs for the State. For instance, 1 percent increase in unemployment reduces the GDP by 2 percent

Way forward:

- There are number of labour intensive manufacturing sectors in India such as food processing, leather and footwear, wood manufacturers and furniture, textiles and apparel and garments. Special packages, individually designed for each industry are needed to create jobs.
- Public investment in sectors like health, education, police and judiciary can create many government jobs.
- Decentralisation of Industrial activities is necessary so that people of every region get employment.
- Development of the rural areas will help mitigate the migration of the rural people to the urban areas thus decreasing the pressure on the urban area jobs.
- Entrepreneurs generate employments to many in a country; therefore government needs to encourage entrepreneurship among the youth.
- Concrete measures aimed at removing the social barriers for women's entry and their continuous participation in the job market is needed.
- Government needs to keep a strict watch on the education system and should try to implement new ways to generate skilled labour force.
- Effective implementation of present programs like **Make in India, Skill India, Start up and Stand-Up India**.
- There is a need for **National Employment Policy (NEP)** that would encompass a set of multidimensional interventions covering a whole range of social and economic issues affecting

many policy spheres and not just the areas of labour and employment. The policy would be a critical tool to contribute significantly to achieve the goals of the 2030 Agenda for Sustainable Development.

Analyse in what way helping farmers produce solar energy can help realise the government's target of doubling farmers' incomes.(250 words)

Indianexpress

Why this question:

The article discusses how solar energy can help the farmers realise doubling their income.

Demand of the question:

One has to analyse and suggest in what way harnessing the solar plant potential can help farmers augment their income.

Directive word:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction

Discuss the initiatives taken on this front by the government recently.

Body

With the latest Budget mentioning how annadata (farmer) can become the urjadata (producer of solar power). Discussion should focus on explaining how alternative model can help farmers produce solar power on their lands. Take hints from the article and substantiate your opinion and establish how solar energy generation along with agriculture can prove to be a game changer for farmers in India.

Conclusion

Conclude with way forward.

Introduction:

The Union Finance Minister (FM) in her maiden budget speech reiterated the idea of farmer being a solar energy producer through solar farming. In the Parliament, the agriculture minister for state, responding to a question on the prime minister's promise of doubling farmers' income (DFI) by 2022, admitted that the existing set of policies cannot double farmers' real incomes by 2022.

Body:

Farmers as solar power producers can help achieve DFI:

- The PM has set a target of producing 100 GW of solar power by 2022.
- He wants to be one of the frontrunners in International Solar Alliance for clean energy.
- So far, the model that has been adopted to develop solar power is inviting bids from large business players and big players did enter.
- Some people who entered early into Power Purchase Agreements (PPA) with state governments had to suffer, when the costs came down.
- Then, the state governments also forced them to revise the costs of PPA downwards, upsetting their economic calculations.

- But, this model of generating solar power was not very inclusive.

Measures needed:

- **Replace all pump sets with solar pumps and the excess power generated can be purchased by the state government.**
- This gives the farmers a good margin over their cost of producing it.
- **Encourage farmers to grow “solar trees” on their lands in a manner that enough sunlight keeps coming to plants below.**
- Here, the farmers can keep growing irrigated crops as they have been doing, but the solar trees generate a lot of excess power that can be purchased by the state government.
- The power generated under this variant is multiple times more than that produced under the first variant, and, the income augmentation can also be several times more.
- **Solar -cum-agricultural farms:** Carrying out expansion of solar power capacity as well as for crop farming together is known as solar-cum-agricultural farm.
- The power produced by the photovoltaic modules installed in the fields can help meet energy needs of the farm operations besides selling the remaining power.
- The rainwater falling over the photovoltaic panels can be collected for irrigation, turning it into solar-cum-agriculture-cum-rainwater harvesting farm.

Economic Survey findings:

- Indian Council for Research on International Economic Relations’ (ICRIER) global survey found that it is being practiced in many countries like Japan, China, Germany, etc and India is ripe for this.
- The problem is mobilising enough capital to install these solar trees.
- In one acre, you can have 500 solar trees in such a manner that even tractors can move through them and farmers can keep growing their normal crops.
- It does not affect their productivity as there is ample sunlight coming from the sides for the crops to perform photosynthesis.
- The second precondition is that the state should be ready to sign the power purchase agreement.

Way forward:

- Setting up of such integrated agri-photovoltaic farms is typically a cost-intensive proposition, heavy investments may be unaffordable for most Indian farmers.
- It is advisable to encourage the solar energy entrepreneurs to consider joining hands with the farmers on mutually agreed terms, instead of going in for solo photovoltaic units.

- This will be mutually beneficial for both of them otherwise, agri-solar farms may not proliferate.

Conclusion:

The Indian government should help farmers by providing subsidies and loans to acquire solar powered agricultural tools. Agricultural experts should encourage guiding farmers in operating them. India must exploit the potential of this decentralised technology to achieve the dual national targets of 100 GW of solar and doubling farmer's income by 2022 — setting a world-class example of greening the economy and overcoming its developmental challenges, simultaneously.

"J&K is known for high emotions and low economy", in the context of the statement provide for an analysis of the development aspects in the state and also suggest way forward.(250 words)

Livemint

Why this question:

The article captures the sick picture of the state of Jammu and Kashmir in terms of development status of its economy.

Key demand of the question:

One has to examine and analyse in depth the root causes for such an infant nature of the Kashmir economy, why has the growth stagnated in the valley for decades and suggest what should be the way forward.

Directive:

***analyze** – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.*

Structure of the answer:

Introduction:

Define the current conditions in the state, the latest happenings of scrapping of article 370 etc.

Body:

Explain that J&K does not have enough private sector avenues and politics hasn't produced enough opportunities and conducive atmosphere owing to insufficient urbanization, lack of finances, formalized economy and industrialization.

Explain the factors that have led to the situation so far.

Discuss what needs to be done? What are the repercussions of the latest move taken by the government etc.

Conclusion:

Conclude with way forward.

Introduction:

The government recently introduced a **resolution to remove provisions of Article 370**, which provides special status to Jammu and Kashmir. In addition, Home Minister also introduced a Bill bifurcating the State of Jammu of Kashmir into Union Territory of Ladakh and the Union Territory of Jammu and Kashmir. The Presidential Order has extended all provisions of the Constitution to Jammu and Kashmir, including the chapter on Fundamental Rights. Therefore, the discriminatory provisions under Article 35A are now unconstitutional.

Body:

The economy of Jammu and Kashmir has suffered from disturbed conditions prevailing in the State for almost two decades. J&K does not have enough private sector letters and politics hasn't produced enough vowels because it is insufficiently urbanized, financialized, formalized and industrialized. **Article 370 and 35A created huge regulatory and legislative cholesterol** in land markets and labour markets that created an antibiotic reaction to formal enterprises, institutional capital, and professional workers. The fragile political and security situation has further dissuaded the investors in J&K.

J&K- an economic infant:

- The huge chunk of Kashmir's workforce employed in horticulture and handicrafts gets less than 20% of the final sale price of their goods because of lack of design, distribution and capital.
- The hospitality industry does not have a robust local people supply chain, has less business model diversity, and lower employment elasticity of growth because of weak access to technology, capital, and marketing.
- The state not only has a **lower credit-to- GDP ratio than Bihar**, but its primary banking institution is almost unskilled—it knows how to give money but not how to get it back. Low formalization means no private firm with more than 500 formal employees.
- There is **only one listed company**, and **private investment last year was less than ₹1,000 crore**.
- Given how the potential for professional tourism, horticulture, handicrafts, and manufacturing could combine with how smart the people are, it is not unfair to say that the **J&K economy is a 10-horsepower engine running on one horsepower**.

Measures needed:

- More effective implementation of employment-oriented schemes and programmes.

- Tourism is another area which is a gift of nature to the state. But unless we are able to create the requisite infrastructure and other facilities of high quality of international standard for the tourists, the real benefits will not flow to people in terms of income supplementation and employment generation.
- The state has three distinct niches, while leisure tourism is available in Kashmir valley, Pilgrim in Jammu and Ladakh has the potential to after adventure tourism
- Human resource development through education and health is not only a pre-requisite for better human living but is also critical in determining the pace of economic development of a society.
- There is a need to give **fillip to the economic activities** that have traditionally been the mainstay of the State's economy and continue to hold significant potential for growth and employment.
- Such activities include **Agriculture (including Horticulture), Food Processing, Handicrafts and Handlooms, and Livestock and Poultry farming** on modern lines.
- It would be equally necessary to **ensure diversification of the State economy**, especially expanding the industrial base by generally have a traditional bent of mind. Diversification of agricultural activities is the need of the hour to keep up with the changed circumstances.
- Jammu and Kashmir has unexploited capacity to produce products which have value demand and ready for attractive markets both in India and Overseas. E.g. bio aromatics, medical herbs, organic specialty vegetables etc.
- The **potential of Horticulture** in J&K is high, given the rich diversity in its flora and fauna and varied agro-climatic situation. The state enjoys monopoly in certain fruits, vegetables and medicinal plants and there is an immense scope for increasing the production of other horticulture produce that are marketed in rich and export markets.
- Jammu and Kashmir is **rich in handicrafts**, so state Government must promote handicrafts industries by increasing shopping arcade in their existing properties and provide space for handicrafts industry to display their products.

Conclusion:

The significant move, in theory, opens up potential opportunities for development-led economic growth in the Union Territories of J&K and Ladakh. Thus, the move is bound to have a significant impact on the demography, culture, and politics of J&K. Whatever its intent in enabling the full integration of Jammu and Kashmir with India, this decision to alter the State's status could have unintended and dangerous consequences.

Discuss the recent liquidity crisis that the NBFCs are facing in the country and its impacts on various financial aspects of the economy. Throw light upon the steps taken by the government in this regard and suggest way forward to address the problems that have contributed to the crisis.(250 words)

The hindu

Why this question:

The Reserve Bank of India (RBI) has announced new measures to increase credit flow to the Non-Banking Finance Companies (NBFCs) so as to overcome the on-going liquidity crunch in the sector. Thus, it is important to examine the environment of NBFCs in the country.

Key demand of the question:

The answer must discuss in detail the liquidity crisis facing the NBFCs and the role of government in dealing with the crisis.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what are NBFCs.

Body:

Students must first bring out in brief the worsening credit situation of NBFCs and the causes for it, then explain the recent measures taken by the RBI to deal with the same – RBI has increased the cap on a bank's exposure to a single NBFC to 20% of its tier-I capital from 15% now.

Bank lending to registered NBFCs (other than MFIs) for on-lending to Agriculture up to ₹10.0 lakhs; Micro and Small Enterprises up to ₹ 20.0 lakh and housing up to ₹ 20.0 lakh per borrower to be classified as priority sector lending.

Also explain the measures taken in the last year and its effect on NBFCs.

Conclusion:

Conclude with way forward.

Introduction:

A Non-Banking Financial Company (NBFC) is a company registered under the **Companies Act, 1956** engaged in the business of loans and advances, acquisition of shares/ stocks/ bonds/ debentures/ securities issued by Government or local authority or other marketable securities of a like nature, leasing, hire-purchase, insurance business, chit business. However, it does not include any institution whose principal business is that of agriculture activity, industrial activity, purchase or sale of any goods (other than securities) or providing any services and sale/purchase/construction of immovable property.

Body:

How the NBFC crisis has panned out

Aug 2018: IL&FS crisis becomes public. With a debt of ₹91,000 crore, it defaults several times in Sep.

Sep: Crisis leads to sell-off in shares of several NBFCs. This leads to redemption pressure on many MF schemes.

Jan 2019: Essel Group's debt troubles become public. MFs and NBFCs enter into a "standstill agreement" with the promoter family to not sell the pledged shares of Zee Entertainment Enterprises.

Feb: Reliance group and its lenders and MFs enters into an Essel-like pact.

Apr: CARE Ratings downgrades debt programme of Reliance Capital and two of its arms, Reliance Commercial Finance and Reliance Home Finance.

May: Icra downgrades ratings on long-term bonds of Yes Bank with a negative outlook.

NBFC crisis:

- NBFC is passing through a turbulent period following a **series of defaults by Infrastructure Leasing and Financial Services (IL&FS)** and the **subsequent liquidity crunch**.
- Several corporates, mutual funds and insurance companies had invested in short-term instruments such as commercial papers (CPs) and non-convertible debentures (NCDs) of the IL&FS group that has been defaulting on payments since August.
- This has stoked fears that many of them could have funds stuck in IL&FS debt instruments which, in turn could lead to a liquidity crunch in their own backyard.
- There are rising fears that the funding cost for NBFCs will zoom and result in a sharp decline in their margins.
- Higher borrowing costs and narrowing options to raise funds will pose challenges for retail non banking finance companies (NBFCs) in the fiscal year ending March 2019.
- The bond yields have gone up sharply to around the 8% mark. That is making borrowing costlier even at the short end of the yield curve.
- NBFCs are likely to witness higher pricing pressure as competition in the retail segment intensifies going forward this is expected to be accentuated by narrowing funding avenues and higher systemic rates.
- Higher fuel prices, weaker dollar and the trade war could hit the SME sector badly. This would mean defaults by SMES, which have been a traditional market for NBFC lending.
- Investors are worried about a credit downgrade backlash on NBFCs. That could mean huge write-offs for investors.
- Mutual funds who have invested in market instruments of NBFCs have faced increased redemption pressures.
- A kind of contagion then spread to other financial stocks, and the benchmark indices crashed, creating wider impacts.

- Following the credit crunch after IL&FS crisis, RBI provided special incentives to banks to enable the flow of funds to NBFCs.

Government steps to fight NBFC liquidity crisis:

- The RBI has decided to increase the cap on a bank's **exposure to a single NBFC to 20% of its tier-I capital from 15% now.**
- RBI has decided to give '**priority sector**' tag for banks lending to NBFCs, for on-lending to farm, small and medium enterprises and housing sector.
- The RBI has asked the non-banking financial companies (NBFCs) with assets of more than ₹5,000 crore to appoint a **chief risk officer (CRO).**
- The Reserve Bank of India (RBI) has extended the coverage of **Ombudsman Scheme for Non-Banking Financial Companies (NBFCs), 2018** to eligible Non Deposit Taking Non Banking Financial Companies (NBFC-NDs).
- The Reserve Bank of India (RBI) has decided to merge three categories of Non Banking Financial Companies (NBFCs) into a single category to provide greater operational flexibility to non-banking lenders. NBFCs categorized as Asset Finance Companies (AFC), Loan Companies (LCs) and Investment Companies (ICs), will be merged into a new category called NBFC – Investment and Credit Company (NBFC-ICC).
- The Reserve Bank of India has permitted banks to grant partial credit enhancement (PCE) to bonds issued by NBFCs and housing finance companies recently.

Way forward:

- Given the growing size and dominance of the NBFC sector, it is important that the threshold capital levels for entry be substantially increased. It may be prudent for RBI to evaluate the need to shore up minimum capital requirements for various NBFCs.
- While RBI has identified systemically important NBFCs, it needs to step up the monitoring of NBFCs which belong to large, diversified groups. Checks and balances are needed to ensure that risks do not build up in the sector due to structures which are too-complex-to-manage.
- RBI could consider re-visiting some of the unimplemented recommendations of the Working Group on Issues and Concerns in the NBFC Sector chaired by Usha Thorat in 2011.
- One such recommendation was the introduction of a liquidity coverage ratio for NBFCs. The objective was to ensure that NBFCs have cash balances and holdings of government securities which may fully cover gaps between cumulative outflows and cumulative inflows for the first 30 days. This would be the buffer in times of stress.

Rural tourism not only contributes to tourism industry but also creates local economic growth and overall sustainable development. Discuss.(250 words)

Chapter 2. Rural Tourism in India, Kurukshetra: April 2019 Issue

Why this question:

The question is based on the theme of rural tourism.

Key demand of the question:

The answer must capture the concept of rural tourism in India and in what way it brings sustainable development along with rural local economic growth.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define rural tourism.

Body:

Rural development is a necessity for India and any strategy/ policy in this direction is a welcome step. There is a lot of scope of rural tourism, given the vast rural hinterland of India and growing connectivity between urban and rural centers.

Explain opportunities in rural tourism and also discuss what benefits it could provide. E.g Desire for escape from the monoculture of city living. Increasing Interest in Outdoor Recreation, Eco-Tourism and Special Interest Tourism. Rural locations are ideal for relaxation and rejuvenation. Over-familiarity and Congestion with traditional tourist resorts Increased Interest in alternative and off-beat attractions Curiosity for rural India and its culture, customs and heritages Accessibility of Rural Areas. Growing number of special interest tourists etc.

Conclusion:

Conclude with way ahead and reassert that rural tourism holds huge potential in transforming rural society of India in terms of growth and development.

Introduction:

Rural tourism is, “experience oriented, the locations are sparsely populated, it is experience oriented, the locations are sparsely populated, it is pre-dominantly in natural environment, it meshes with and local events and is based on preservation of culture, heritage and tradition.”

Body:

Rural tourism contributing to rural development:

- **Reduces migration:**
 - Rural Tourism facilitates the declining areas to be developed with basic infrastructure facilities and provides the host community alternative ways of employment and side by side it reduces out-migration.
 - It fosters a closer relationship between city dwellers and rural communities.
- **Alternative Way of Earning:**
 - Most of the rural dwellers in India are dependent on traditional agricultural activities to maintain their livelihood.

- In this connection, rural tourism can be a potential tool to reduce their over-dependency on cultivation and it contributes to the overall economic development of an area that would otherwise be deprived.
- **Employment:**
 - Rural tourism creates a large number of semi-skilled jobs for the local population in not only local hotels and catering trades but also in other fields like transport, retailing, heritage interpretation etc.
 - Moreover, it ensures revival of traditional arts, crafts, building art etc. and brings marketing opportunity for rural producers to sell their products directly to the tourists.
 - Rural performers are hired for cultural programs where they can exhibit talent and also can earn money.
 - It allows alternative sources of earning opportunities from non-agricultural sectors that improve living standards of the rural dwellers to some extent.
- **Job Retention:**
 - Cash flows generating from rural tourism can assist job retention in services such as retailing, transport, hospitality, medical care etc. It provides additional income for farmers, local fishermen and local suppliers
- **Alternative Business Opportunities:**
 - Rural Tourism generates new business opportunities even those rural businesses, not directly related to tourism can also gain benefit from tourist activity through developing close relationships with tourist facilities.
 - For example, a number of tourists love to taste local cuisines of different tourist spots. Therefore any restaurant serving ethnic foods can also attract tourists though many of these restaurants are not directly related to tourism business.
- **Poverty Alleviation:**
 - Rural Tourism is being admired all over the world because such form of tourism can shape up rural society both by economic and social terms.
 - It brings both monetary and social benefits to the rural people.
 - It alleviates poverty by creating alternative sources of earning.
- **Empowerment of Localities:**
 - Rural Tourism cannot be flourished without the involvement of local people in it.
 - Accommodation facilities are being provided by local hotel owners whereas local suppliers supply food and beverages to the local hotels.

- Local producers produce locally made products as per tourists demand and earn money by selling them in the local market.
- To entertain tourists, local organizers conduct different cultural programmes where local performers exhibit their art and culture through live performance.
- Not only that, rural people also become engaged in different decision-making processes. All such engagement actually empowers the localites.
- **Entrepreneurial scope:**
 - Rural Tourism has increased career options for these young entrepreneurs.
- **Arts and Crafts Sale:**
 - Arts and crafts are the evidence of local culture and heritages of a community belonging from any region or any nation. The urban tourists, wherever they go, generally prefer to have a collection of local arts and crafts to make their trip-experience a remembering one.
 - Such tendency motivates them to purchase local arts and crafts from the local producers and artists.
 - Side by side it encourages the local community to sell their products in local market. Such practice opens an alternative way of earning to the rural people.
- **Environmental Improvement:**
 - Environmental improvements such as village paving and traffic regulation schemes, sewage and litter disposal can be assisted by tourism revenues and political pressures from tourism authorities.
 - These help develop pride of place, important in retaining existing population and businesses, and in attracting new enterprises and families.
- **Heritage Preservation:**
 - Rural Tourism brings a strong sense of emotion in everyone's (both community and tourists) mind to preserve and reserve the local culture and heritages to make any place attractive for the tourists to visit it and also for the host community to live in.
 - Such sense is maintained through rural museums that play a significant role in local heritage preservation.

Way forward:

- **Resources mapping** brings to the fore what rural India has to offer to tourists.
- Traditionally Indian society is known for its hospitality; however some **basic training on soft skills** to engage the tourists will certainly be helpful.

- The **education and awareness at community level** will be very crucial for developing sustainable tourism practices in villages.
- **Panchayats, NGOs and community organisations** have an important role to play here by way of engaging both communities and tourists to promote responsible tourism.
- There is a need to develop the **Accessibility, Accommodation, Attractions and Amenities (4A's)**.
- Encouraging local entrepreneurs, private enterprises, investors and other tourism stakeholders to come under a common umbrella for basic rural infrastructure development activities is also essential.
- Better implementation of the Government schemes viz. **Swadesh Darshan, PRASAD, Special Tourism Zones and Promotion of e-Tourist Visa facilities**.
- Promotion of **non-intrusive rural tourism with preservation of traditional cultures** should be done.

"Ease of living should be the ultimate aim of the country, while ease of doing business is merely one of the pathways to achieve it." Elucidate.(250 words)

Prime minister's speech for 73rd Independence Day from the Red fort.

The hindu

Why this question:

The phrase has been picked up from Prime minister's speech for 73rd Independence Day from the Red fort, it aims to throw light upon ease of living in the country and dire need of the same.

Key demand of the question:

Discuss the concept of ease of living, significance of ease of doing business.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what is ease of living and ease of doing business.

Body:

Prime Minister Narendra Modi has reiterated that the priority of Central Government is to ensure Ease of Doing Business and Ease of Living, the Digital India Campaign has ensured Ease of Living for common people.

Discuss the various aspects of policies of the govt. that is ensuring ease of living.

Conclusion:

Conclude with way forward.

Introduction:

The individual's ease of living is **the level of wealth, comfort, material goods and necessities available to them in a certain geographic area**. It includes **factors like income, quality and availability of employment, class disparity, poverty rate, quality and affordability of housing, education, growth, environmental quality**. The ease of living is closely related to the **quality of life**.

Body:

Need to target ease of living:

- In the recently released **Global Hunger Index (GHI)**, India featured at the 100th position among 119 countries, lagging behind even North Korea and Iraq.
- **About 40 per cent of city's population** is compelled to live in slums, and municipal authorities have failed consistently to come up with affordable housing schemes for people with low income.
- A census report states that 64 million people live in India's slums. The problem becomes more severe with urban India, where 17 per cent people live in slums. Over 70 per cent of slum households get their water from a tap, but just half of them get water in their homes.
- With burgeoning urban population, existing urban infrastructure, both institutional and physical, is being tested.
- From demands of reservations for locals in educational institutes and hospitals, to permanent damage to eco-systems, drainage networks and water-tables, side effects of poorly thought out and badly regulated urbanisation are beginning to show

How ease of doing business leads to ease of living:

- The reforms undertaken to ease of doing business helps in **removing excess influence of the governments from people's lives**.
- The people would have the freedom of **pursuing their aspirations**.
- It **reduces the policy paralysis** and strengthens the confidence of business environment.
- With better policies in lieu of attracting business, it helps in **more job creations** reducing the unemployment rate and in turn **increases the per capita income**.
- With ease of doing business, many **job seekers would turn into job-givers**, thereby spurring the economy by investment.
- The **infrastructure- physical and socio-economic** will be rejuvenated to **ensure faster connectivity** which enhances business and in turn the lives of people in rural areas.
- The ease of doing business would **help attract foreign investments** into India, providing the necessary capital to start new ventures.
- It could help **foray into new avenues** from food processing to fibre optics thereby diversifying the business chains horizontally.
- With introduction of the state of the art science and technology features, it can lead to spin-off effects helping the socio-economic development of society.

Way forward:

- Efficiency, Productivity, quality, speedy implementation and execution of upgraded scheme with help achieve the targets.

- Economic growth and job creation addresses Ease of Living to an extent.
- Role of society in it is imperative.
- Need to adopt holistic approach like industries can be created with manpower intensive since growth does not always translate into jobs.
- Decentralised and universal coverage of health and education to the lowest rung of the society should be ensured.

Conclusion:

It is more important of looking at people at large. People at ground level should feel happiness, change, providing them opportunity to lead life with dignity. If people's life is comfortable and if they are happy automatically the productivity increases because "Happy society is a flourishing society".

What are Differential Voting Rights? Discuss the role played by them in the growth and expansion of start-up ecosystem in India.(250 words)

Reference

Why this question:

The article talks about the concept of DVRs and applicability to start-ups.

Key demand of the question:

The answer must discuss the significance of DVRs and their role in promoting start-ups.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe what are DVRs.

Body:

Discuss the concept of DVR – A DVR share is like an ordinary equity share, but it provides fewer voting rights to the shareholder.

Why do companies issue DVR? – Companies issue DVR shares for prevention of a hostile takeover and dilution of voting rights. It also helps strategic investors who do not want control, but are looking at a reasonably big investment in a company.

At times, companies issue DVR shares to fund new large projects, due to fewer voting rights, even a big issue does not trigger an open offer.

Explain in what way they can contribute to start -ups.

Conclusion:

Conclude with way forward.

Introduction:

Differential Voting Rights (DVRs), which do not follow the common rule of one share-one vote, enable promoters to retain control over the company even after many new investors come in, by allowing shares with superior voting rights or lower or fractional voting rights to public investors. The Ministry of Corporate Affairs has amended the provisions relating to Differential Voting Rights (DVRs) under the Companies Act.

Body:

In the past, companies such as Tata Motors, Pantaloon Retails and Jain Irrigation issued DVRs having fractional voting rights of 1/10th of the ordinary shares to public investors. These shares offer higher dividend compared to the ordinary shares in lieu of the voting rights taken away.

But the issuance of DVRs with superior voting rights was prohibited by the SEBI. This was to prevent the possible misuse of power by the promoters detrimental to the interests of small shareholders.

Role played by DVRs in expansion of start-up:

- The ministry of corporate affairs (MCA) has raised the existing cap of 26 per cent of the total post issue paid up equity share capital to 74 per cent of total voting power in respect of shares with DVRs of a company.
- To make capital available to Indian start-ups and to encourage listing on the country's exchanges, SEBI recently permitted Initial Public Offering (IPO) of unlisted companies with shares of superior rights.
- Start-ups and technology companies will be able to issue shares with differential voting rights (DVRs) with the government amending the Companies Act provisions to help entrepreneurs retain control even as they raise equity capital from global investors.
- This will surely help promoters, especially start-ups, in raising capital without diluting their control over the company
- It strengthens the hands of Indian companies and their promoters who have lately been identified by deep pocketed investors worldwide for acquisition of controlling stake in them to gain access to the cutting edge innovation and technology development being undertaken by them

Conclusion:

This move is aimed at enabling promoters of Indian companies to retain control of their companies in their pursuit for growth and creation of long-term value for shareholders, even as they raise equity capital from global investors.

Despite the Microcredit system that has a great scope in alleviating socio-economic problems, existing systems requires restructuring in several areas to allow for long lasting benefits. Comment.(250 words)

[Indianexpress](#)

Why this question:

The article explains the current conditions of Microcredit and its scope to alleviate socio-economic problems and in what way these conditions alone can not fix all the economic problems.

Key demand of the question:

The answer must evaluate the impact of micro credit systems and the need for restructuring existing systems for better economic conditions in the country.

Directive:

***Comment**— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.*

Structure of the answer:

Introduction:

Begin with what you understand by microcredit systems – Microcredit refers to the granting of very small loans to impoverished borrowers, with the aim of enabling the borrowers to use that capital to become self-employed and strengthen their businesses. Loans given as microcredit are often given to people who may lack collateral, credit history, or a steady source of income.

Body:

Discussion should include the following:

Explain first in what way microcredit has gained much traction as a tool for ensuring the welfare of the most impoverished in the society but there are certain flaws in the model.

Discuss what is the core idea of microcredit, how has it helped improve the socio-economic conditions of the poor in the country.

Explain what more restructuring is envisaged or required to better the conditions of economy apart from microcredits.

Conclusion:

Conclude with way forward.

Introduction:

Microcredit refers to the **granting of very small loans to impoverished borrowers, with the aim of enabling the borrowers to use that capital to become self-employed and strengthen their businesses.** Loans given as microcredit are often **given to people who may lack collateral, credit history, or a steady source of income.** It has gained much traction as a **tool for ensuring the welfare of the most impoverished in the society** but there are certain flaws in the model.

Body:

Potential of Microcredit:

- The core idea of microcredit is that a small loan will provide access to the larger economy to people who typically live outside the scope of the institutions on which the mainstream economy rests.
- Such a loan is meant to enable them to commence with productive activities, and will give them the initial boost required to gain entry into an industry, after which production will be able to sustain itself, and the loan will gradually be repaid.
- Microcredit agreements frequently do not require any sort of collateral, and sometimes may not even involve a written agreement, as many recipients of microcredit are often illiterate.
- When borrowers demonstrate success in paying their loans on time, they become eligible for loans of even larger amounts, allowing them to finance expansion.

Case study: *An example of a microcredit institution is the Grameen Bank in Bangladesh, founded in 1976 by Mohammed Yunus. The Grameen Bank offers small loans to the impoverished without asking for collateral, and was the pioneering institution in the realm of microfinance. The bank has 8.4 million followers, 97% of whom are women, and the bank has repayment success rates between 95 to 98 percent.*

Challenges faced:

- The primary reason for the **lackadaisical effects of microcredit is the stringent repayment schedule** offered by most microcredit institutions.
- Since most borrowers to whom microcredit is given have **little to no credit history** as a result of their exclusion from traditional systems of credit, institutions offering microcredit are unable to judge the risk associated with lending to certain borrowers, and cannot be sure what the risk of them defaulting will be.
- To lower the risk of defaulting, microcredit lenders therefore **resort to repayment schedules** that demand an initial repayment that is almost immediate, after which borrowers must adhere to an inflexible weekly schedule for repayments.
- The effect of this is that borrowers are unable to use the loans on investments that will take some time to be fully realised, and instead are forced to use the loans they receive on short term investments that only boost production to an extent, and the overall growth of their incomes remains meager.
- A study found that having access to microcredit made very little difference to changing the lifestyles of borrowers, based on six indicators: household business profits, business expenditures, business revenues, consumption, consumer durables spending, and spending on temptation goods. These indicators only saw a 5% impact when microcredit was available.

Measures needed:

- There is a need for microcredit to consider adopting more flexible operating models, providing skills training and offering services such as portability of accounts to provide greater access for a longer duration of time.
- A diversified menu of micro loan products linked to sustainable income generation activities via micro enterprises or a creation of community-based pooled enterprise could possibly make it more attractive and compatible with the requirements of women.
- In addition, linking such developmental initiatives to an institution to nurture, monitor and handhold those activities in the formative stages is crucial for sustainability.

Conclusion:

Microcredit has a vast range of applications for poverty alleviation and general development, but existing systems require reform in multiple areas to allow for unfettered benefits that last. Furthermore, in areas where the application of microcredit is relatively new, microcredit systems must be carefully evaluated before they are put into place, so as to enable the greatest benefit from such institutions.

What is Development Finance Institution? In what way is it different from commercial banks? Discuss the need for India to have DFIs to Fund Infrastructure.(250 words)

The hindu

Why this question:

Recently The government has proposed to set up a development financial institution (DFI) to solve the infrastructure financing needs of the country.

Key demand of the question:

The question is straightforward and is about discussing the significance of development financial institution (DFI) and how it is different from commercial banks and its relevance in infrastructure funding.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You must give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short explain DFI.

Body:

Explain what is DFI, what are the advantages of having DFI.

Discuss in what way they are different from commercial banks.

Then move onto discuss why India needs DFIs to Fund Infrastructure?

Conclusion:

Conclude with the significance of DFI for Indian infrastructure sector.

Introduction:

A Development Financial institution (DFI) is defined as “an institution endorsed or supported by Government of India primarily to provide development/Project finance to one or more sectors or sub-sectors of the economy. The first DFI was the **Industrial Financial Corporation of India (IFC)** that was launched in 1948. **IDBI, UTI, NABARD, EXIM Bank, SIDBI, NHB, IIFCL** etc are the other major DFIs.

Body:

The government has proposed to set up a development financial institution (DFI) to solve the infrastructure financing needs of the country.

DFI vis-à-vis banks:

- The institution differentiates itself by a thoughtful balance between commercial norms of operation, as adopted by any financial institution like commercial bank and developmental
- It emphasizes the long term financing of a project rather than collateral based financing apart from provision of long-term loans, equity capital, guarantees and underwriting functions, a development institution normally is also expected to upgrade the managerial and the other operational requirements of the assisted
- Its association with its clients is of an on-going nature and of being a companion in the project than that of a plain lender like banks.
- The basic stress of a DFI is on long-term finance and support for activities to the sectors of the economy where the risks may be higher that may not be feasible for commercial banks to finance them.

- Role of DFIs is not just long term financing but more of development of significant sectors of our economy for hastening growth.

DFI and Infrastructure Funding:

- To boost economic growth which would increase capital flows and energise capital markets.
- To improve long term finances.
- To provide credit enhancement for infrastructure and housing projects
- As India does not have a development bank, DFI would fulfil the need for us to have an institutional mechanism.
- Debt flow towards infrastructure projects would be improved.

Conclusion:

The RBI had also specified in 2017 that specialised banks could cater to the wholesale and long-term financing needs of the growing economy and possibly fill the gap in long-term financing. Thus, it would be wise to revive the concept of DFI if the government wishes to keep societal, cultural, regional, rural and environmental concerns intact.

Diversification of jobs from agriculture to other sectors is inevitable for the stability of rural economy in India. Discuss with suitable justifications.(250 words)

Reference

Why this question:

The question is about evaluating the need for diversification of Agri related jobs to bring stability in the rural economy of the country.

Key demand of the question:

Explain the need for diversifying the agricultural setup in the rural regions of India into other sectors for better stability of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short explain the current context of the question.

Body:

One must explain in detail the need for Diversification of jobs from agriculture to other sectors. First explain why should there be an encouragement to shift in the rural agrarian economy to other sectors. Contrary to the common perception about predominance of agriculture in rural economy, about two third of rural income is now generated in nonagricultural activities.

Similarly, it looks amazing to find that more than half of the value added in manufacturing sector in India is contributed by rural areas. However, the impressive growth of non-agricultural sector in rural India has not brought significant employment gains or reduction in

disparity in worker productivity. This underlines the need for a new approach to direct the transition of rural economy.

Conclusion:

Conclude with way ahead.

Introduction:

Agriculture is the primary source of livelihood for about 58 per cent of India's population. Gross Value Added by agriculture, forestry and fishing is estimated at Rs 17.67 trillion. Yet Indian agriculture faces multiple issues like small and marginal landholdings, lack of access to agricultural credit, environmental degradation, low value addition etc, which in turn affect the agricultural income.

Body:

Need for diversification of jobs:

- Recent survey by the **National Bank for Agriculture and Rural Development (All India Rural Financial Inclusion Survey)** shows that the average monthly income of rural households is Rs. 8,059, with agricultural households deriving only 43% of their income from agriculture. Most of it is from providing **daily wage labour and government jobs**.
- Reducing the dependence of rural masses on agriculture will help improve the overall income of the rural population
- The government has sought to double farmer income by raising minimum support prices, but such initiatives would apply directly only to 48% of rural India, with non-agricultural households being left behind
- Diversification, away from marginal farming, helps to **overcome land constraint** to income growth, while allowing farmers to cope with exogenous shocks through additional income.
- It even allows them to **reinvest in productivity enhancing agricultural technologies**.
- Conversation on raising farmer income needs to embrace non-farm diversification, an important pathway for empowering landless labourers and marginal farmers.
- It helps overcome the **disguised unemployment** which has raised the labour cost in other sectors due to poor supply of labour.
- According to the National Sample Survey Office's (NSSO's) periodic labour force survey (PLFS) report showed a collapse in agricultural jobs as a key reason behind rising unemployment, particularly in the rural parts of the country.
- The proportion of people, in the working age group, employed in agriculture fell by 8 percentage points for rural men and 9.3 percentage points for rural women, an analysis of the NSSO's PLFS report for 2017-18.
- The share of agriculture in rural output is 39%, whereas the rest is contributed by the **manufacturing, construction and services sectors**.

Benefits of Rural Non-Farm sector:

- When the economic base of the rural economy extends beyond agriculture, **rural-urban economic gaps** are bound to get narrower along with salutary effects in many other aspects associated with the life and aspirations of the people.
- Rural industries are generally less capital-intensive and more labour absorbing.
- Rural industrialization has significant spin-offs for agricultural development as well.
- Rural income distribution is much less unequal in areas where a wide network of non-farm avenues of employment exists; the lower strata of rural societies participate much more intensely in non-farm activities, though their involvement is much less remunerative as compared with that of the upper strata.

Measures needed for diversification of jobs:

- The livestock sector, which contributes around 4% to India's gross domestic product (GDP), is particularly critical. India has a mixed crop livestock farming system, with livestock becoming an important secondary source of income.
- There are immense possibilities for diversification in agricultural sector towards more value added activities such as food processing.
- This is an area, which has by and large remained unexploited, because reforms in agriculture sector having been very slow, resources have not yet started flowing into **food processing industries**.
- A strong push to sectors like **food processing, warehousing and logistics** will be very beneficial as it will help push up farmer incomes, reduce the wastage of perishable agriculture commodities and provide employment to rural workers.
- Besides diversification of agriculture there is a strong need to restructure the rural economy by way of **promotion of nonfarm activities in rural areas**.
- Whatever nonfarm activities are being carried out in the rural areas now are more out of desperation to eke out a living rather than an informed choice of a vocation, backed by infrastructural and institutional facilities.
- A **massive improvement in infrastructure** is required to promote growth of rural industries on a sustainable basis.
- This will go a long way in generating good quality employment and meeting many of the consumption requirements of rural people.
- Many steps have been taken in regard to village connectivity, e.g., Prime Minister Gram Sadak Yojana (PMGSY) and telecommunication.
- **Services sector growth** in rural areas could also play a critical role in improving rural income. Sectors like **transport and storage** have recorded reasonable growth in the rural area.

Conclusion:

India's rural development policies should increasingly focus on developing markets, infrastructure and institutions that can help sectors like manufacturing especially small scale industries. While India's post-Independence rural policy has primarily been about driving people away from agriculture and towards cities, India must now incentivise job creation at their doorstep.

Write a note on Bimal Jalan committee that was put in place to review the economic capital framework of the Reserve Bank of India.(250 words)

Indianexpress

Why this question:

The Reserve Bank of India (RBI), in consultation with the government, had set up a six-member committee headed by the former RBI Governor Bimal Jalan to review the economic capital framework of the Reserve Bank of India.

Key demand of the question:

One must discuss in detail the recommendations made by the committee.

Structure of the answer:

Introduction:

In short provide for the background that The RBI Board, which met recently decided to accept the Jalan Committee report and decided to transfer Rs 1.76 lakh crore to the government.

Body:

Explain the key recommendations of the Bimal Jamal committee –

While giving a clearer distinction between the two components of economic capital — realized equity and revaluation balances — the committee recommended that realised equity could be used for meeting all risks/ losses as they were primarily built up from retained earnings, while revaluation balances could be reckoned only as risk buffers against market risks as they represented unrealised valuation gains and hence were not distributable.

As proposed by the panel and approved by the RBI, the entire net income can be transferable to the government only if realised equity is above its requirement. If it is below the lower bound of requirement, risk provisioning will be made to the extent necessary and only the residual net income (if any) transferred to the Government.

Conclusion:

Conclude with significance of the recommendations made.

Introduction:

Reserve Bank of India (RBI) has approved the transfer of record Rs 1.76 lakh crore dividend and surplus reserves to the government. The excess reserve transfer is in line with the recommendation of former RBI governor Bimal Jalan-led panel constituted to decide size of capital reserves that the central bank should hold.

Body:

The Bimal Jalan panel, which was set up to examine the Reserve Bank of India's (RBI) economic capital framework (ECF), would recommend the transfer of the central bank's excess reserves to the government over a period of three-five years

RBI economic capital framework:

- Economic capital framework refers to the risk capital required by the central bank while taking into account different risks.

- The economic capital framework reflects the capital that an institution requires or needs to hold as a counter against unforeseen risks or events or losses in the future.
- The framework the government is talking about is basically about how much capital RBI needs for its operations and how much of the surplus it should pass on to the government.

Suggestions of Bimal Jalan committee:

- The panel recommended a **clear distinction between the two components of the economic capital of RBI i.e. Realized equity and Revaluation balances.**
- Revaluation reserves comprise of periodic marked-to-market unrealized/notional gains/losses in values of foreign currencies and gold, foreign securities and rupee securities, and a contingency fund.
- Realized equity, which is a form of a contingency fund for meeting all risks/losses primarily built up from retained earnings. It is also called the Contingent Risk Buffer (CBR).
- The Jalan committee has given a range of 5.5-6.5% of RBI's balance sheet for Contingent Risk Buffer.
- Adhering to the recommendations, the RBI has decided to set the CBR level at 5.5% of the balance sheet, while transferring the remaining excess reserves worth ₹52,637 crore to the government.
- If CBR is below the lower bound of requirement, risk provisioning will be made to the extent necessary and only the residual net income (if any) transferred to the Government.

- However keeping CBR at a lower range of 5.5% will reduce RBI's space to manoeuvre monetary policy.

Conclusion:

The committee's recommendations were based on the consideration of the role of central banks' financial resilience, cross-country practices, statutory provisions and the impact of the RBI's public policy mandate and operating environment on its balance sheet and the risks involved.

Discuss the key features of e-commerce presently witnessed in India, in what way do you think e-commerce 2.0 could significantly expand India's online market and make it truly inclusive?(250 words)

Livemint

Why this question:

The article captures a discussion on e-commerce 2.0 and its significance.

Key demand of the question:

One must discuss in detail the coming of more and more people in terms of mobile usage and in what way it could significantly impact India's online market and make it inclusive.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief state facts to justify the rising online presence of the people online.

Body:

Explain that by 2022, half a billion Indians are expected to come online through their mobile phones, a population we refer to as India's Next Half Billion (NHB). Their internet journey starts with them gaining internet access, then moving forward step by step to eventually making commercial transactions online.

Briefly discuss the coming of e-commerce in the country, differentiate how e-commerce 1.0 is different from the upcoming e-commerce 2.0.

Discuss the role played by it in expanding the Indian online markets.

Conclusion:

Conclude with significance.

Introduction:

Electronic commerce (e-commerce) is burgeoning as a means to doing business at a very rapid rate and is also showing every sign of continuing to expand. The rise of this new medium is attracting increasing attention by both private and public sector in order to remain upgraded and competitive so as to give 100 per cent services to their customers efficiently and effectively. India's new e-commerce policy came into effect on February 1, 2019.

Body:

Current e-Commerce scenario in India:

- The existing customer base of e-commerce 1.0 is relatively small about 40-50 million.

- Existing e-commerce platforms are better suited to sell structured and branded products (mostly electronics like mobile phones, televisions and air-conditioners).
- They mainly appeal to relatively sophisticated shoppers, for whom convenience and selection are important.
- Their English-first approach and user interfaces are constraints for the Next half billion segment.
- Moreover, the format does not enable an important mechanism for building trust, such as information on what others are doing on the platform.
- For sellers too, e-commerce is designed to cater to larger, organized players, whereas most sellers in India, even online, are small.
- Overall, online shopping is at present more about price discovery than product discovery.
- E-commerce has made important strides, but its penetration is still low in India.

e-Commerce 2.0 and its potential:

- E-commerce 2.0 will expand the market beyond the e-commerce 1.0.
- However, the new version will look, feel, and operate differently from the first wave of online shopping.
- It is expected by 2022, half a billion Indians are expected to come online through their mobile phones, a population we refer to as India's **Next Half Billion (NHB)**.
- The NHB differs considerably from the initial waves of internet users. They have very different income profiles, education levels, language skills, and social/cultural milieus.
- In the last 18-24 months, there has been considerable progress in addressing various barriers they face in their internet journey, due to efforts by entrepreneurs and various government initiatives.
- Consequently, the NHB is now at **an inflexion point for online shopping**.

Vision of e-Commerce 2.0:

- **Value consciousness:** E-commerce 2.0 will be dominated by smaller, unbranded items catering to value-conscious buyers.
- **Trust and confidence:** this is best built by social validation. To achieve this, e-commerce 2.0 players will leverage social communities and influencers on WhatsApp, Facebook, Instagram, and YouTube.
- **Resonance with the NHB context:** Products will be “pushed” to users instead of being discovered through search. This replicates the NHB’s offline shopping experience of being actively assisted and served by shop assistants on retail premises.

- The second wave of e-commerce could change the way Indians shop online, which will evolve from being a **hobby to a habit**.
- A **significant rise in women shoppers** in smaller cities is expected.
- Most importantly, e-commerce 2.0 could significantly expand India's online market and make it **truly inclusive**.

Enablers of e-Commerce 2.0:

- Affordable data to access the various e-Commerce websites and portals.
- Frugal innovation is helpful as well, with low-cost digital payment infrastructure as the prime example.
- Leveraging the communities on social media will help generate trust and confidence in the internet.
- Relatable language and creating inclusive user experiences such as mobile number-based log-ins, apart from simple navigation and purchase recommendations.
- Vernacular platforms and videos have recently emerged as the dominant mode of content consumption

Conclusion:

e-commerce 2.0 will differ from its earlier version in many ways. It will be intent and "impulse-driven", rather than being only intent-driven; make product discovery easier by offering a curated selection instead of a wide selection; focus on smaller and unbranded items instead of larger, branded ones; prioritize value over convenience; leverage influencers and social media; offer bulk-buying for better pricing; use Hinglish and Indic languages with a user interface built for India, and use the viral nature of content and social media platforms to drive customer acquisition.

The idea of merging banks has become a practice in the recent past. In this context, discuss the issues and potential benefits associated with merging of Public Sector Banks. To what extent, it would help to address the burgeoning of Non-Performing Assets?(250 words)
[The hindu](#)

Introduction:

Public Sector Banks (PSBs) in India are fragmented, with some of them reeling under the mounting pressures of Non Performing Assets (NPAs). Economic Survey points out that constant failure of banks to provide credit to both emerging and existing industries has resulted in stagnation in the economic growth of the nation. The government plans to merge 10 public sector banks into four. This would take the number of banks in the country from 27 in 2017 to 12.

Body:

Narasimham committee (1991 and 1998) suggested merger of strong banks both in public sector and even with the developmental financial institutions and NBFCs. **PJ Nayak Committee in 2014** had also suggested that government either merge or privatize state-owned banks.

Benefits of mergers of bank:

- **For Banks:**

- **Small banks can gear up to international standards** with innovative products and services with the accepted level of efficiency.
- PSBs, which are geographically concentrated, can **expand their coverage beyond their outreach.**
- A better and optimum size of the organization would help PSBs offer more and more products and services and help in integrated growth of the sector.
- Consolidation also helps in **improving the professional standards.**
- This will also end the unhealthy and intense competition going on even among public sector banks as of now.
- In the global market, the Indian banks will gain greater recognition and higher rating.
- The volume of inter-bank transactions will come down, resulting in **saving of considerable time in clearing and reconciliation of accounts.**
- This will also **reduce unnecessary interference by board members** in day to day affairs of the banks.
- After mergers, bargaining strength of bank staff will become more and visible.
- Bank staff may look forward to better wages and service conditions in future.
- The wide disparities between the staff of various banks in their service conditions and monetary benefits will narrow down.

- **For economy:**

- **Reduction in the cost of doing business.**
- **Technical inefficiency reduces.**
- The size of each business entity after merger is expected to **add strength to the Indian Banking System in general and Public Sector Banks in particular.**
- After merger, Indian Banks can **manage their liquidity** – short term as well as long term – position comfortably.
- **Synergy of operations and scale of economy** in the new entity will result in savings and higher profits.

- A great number of posts of CMD, ED, GM and Zonal Managers will be abolished, resulting in savings of crores of Rupee.
- Customers will have access to fewer banks offering them wider range of products at a lower cost.
- Mergers can **diversify risk management**.
- **For government:**
 - The **burden on the central government to recapitalize** the public sector banks again and again **will come down substantially**.
 - This will also **help in meeting more stringent norms under BASEL III**, especially capital adequacy ratio.
 - From regulatory perspective, monitoring and control of less number of banks will be easier after mergers.

Challenges associated with mergers:

- A **complex merger with a weaker and under-capitalized PSB** would stall the bank's recovery efforts as the weaknesses of one bank may get transferred and the merged entity may become weak.
- Bigger banks may follow **monopolistic behavior with increased market power** – resulting in neglect of local needs.
- Amalgamation of balance sheet of PSBs will only impact NPA cosmetically, without actually working on NPA recovery. This will further **divert the process of NPA resolution**.
- **Without addressing the governance issues in the banks**, merging two or three public sector banks may not change the architecture.
- Unless there is a change in the operating structures, mergers may not deliver the desired results in the long run.
- Problems to adjust top leadership in institutions and the unions.
- Mergers will result in shifting/closure of many ATMs, Branches and controlling offices, as it is not prudent and economical to keep so many banks concentrated in several pockets, notably in urban and metropolitan centres.
- Mergers will result in **immediate job losses** on account of large number of people taking VRS on one side and slow down or stoppage of further recruitment on the other.
- This will **worsen the unemployment situation further** and may create law and order problems and social disturbances.
- Mergers will result in **clash of different organizational cultures**. Conflicts will arise in the area of systems and processes too.

- When a big bank books huge loss or crumbles, there will be a big jolt in the entire banking industry. Its repercussions will be felt everywhere.

Way forward:

- Giving the **PSBs autonomy along with accountability.**
- Merged entity will require **capital support from the government**, otherwise such a merger would not improve their capitalisation profile.
- Dual regulation by the Ministry of Finance and RBI on PSBs often results in paralysis in decision making – which makes consolidation of banks a redundant measure if they are not given power to act swiftly, as pointed by **PJ Nayak**.
- **Governance of public banks needs to be improved** before making any significant change in any emerging architecture.
- Bigger banks offer more resilience to the banking sector but overlooking bigger red flags like strong credit appraisal and risk control system would do little help in creating robust banks.
- Therefore due focus on ensuring **strong foundation of PSBs is important.**
- RBI should continue to give banking licences for **more small finance banks as well as universal banks** along with bank mergers
- Government on its part would do well to start **infrastructure development banks to fund infrastructure projects** and relieve PSBs of this task.

Conclusion:

Merger is a good idea. However, this should be carried out with right banks for the right reasons. Merger is also tricky given the huge challenges banks face, including the bad loan problem that has plunged many public sector banks in an unprecedented crisis.

With the acceptance of the Bimal Jalan committee's report, the Reserve Bank of India (RBI) agreed to transfer one lakh seventy six thousand to the government. Suggest the ways through which government can prudently utilize these funds?(250 words)

[The hindu](#)

Introduction:

The central board of the Reserve Bank of India (RBI) recently decided to transfer a **surplus of Rs 1.76 lakh crore to the government**-its highest transfer ever-sparking a fierce debate. The government was, it must be noted, acting on the **recommendations of a committee chaired by former RBI governor Bimal Jalan, on capital transfer.**

Body:

Bimal Jalan committee Recommendations:

- The surplus from the central bank comprised two components-**Rs 1.23 lakh crore of surplus for the year 2018-19 and an additional Rs 52,637 crore of excess provisions** that was made available as per the revised economic capital framework recommended by the Bimal Jalan committee.
- It suggested that **the framework may be periodically reviewed after every five years.**
- It recommended **to align the central bank's accounting year with the financial year**, which could reduce the need for paying interim dividend.
- The panel recommended **clear distinction between the two components of economic capital, realised equity and revaluation balances.** This is because of the volatile nature of the revaluation reserves.
- **Only realised equity built from profits must be distributed.**
- The panel recommended that the **Contingency Fund be maintained within a range of 6.5% to 5.5% of RBI's balance sheet.**
- Hence, the excess from the pre-decided 5.5% level or Rs. 52,637 Cr has been written back, that is transferred to the Centre.
- Revaluation gains from market fluctuations on foreign currency, gold or other assets must be retained. **Revaluation balances were not distributable.**
- Hence, **bulk of RBI's legacy reserves are ring-fenced from transfer demands.**
- The Bimal Jalan committee should also be complimented for **clearly specifying that the revaluation reserve cannot be used to bridge shortfalls in other reserves.**

Ways through which the fund can be used prudently:

- The amount could either be used to **provide a fiscal stimulus to the economy**-which is in the **grip of a slowdown-**
- It could be used **to reduce off-balance sheet borrowings.**
- The other option is **to use it to meet an expected shortfall in revenue collections.**
- In the Union budget, the government had presented an optimistic scenario of raising Rs 4.76 lakh crore in additional resources to meet budget expenses.
- However, since there is a clear slowdown ahead, this revenue target may not be met, in which case the surplus from the RBI would be used to bridge the shortfall.
- Normally, the money is transferred to the **Consolidated Fund of India** from which salaries and pensions to government employees are paid and interest payments done, besides spending on government programmes.
- The large pay-out can help the government **cut back on planned borrowings and keep interest rates relatively low.**

- If the government manages to meet its revenue targets, the windfall gain can lead to a **lower fiscal deficit**.
- The other option is to **earmark these funds for public spending or specific projects**, which could lead to a **revival in demand in certain sectors and boost economic activity**.
- If the tax revenue growth picks up, then the government can use the additional money to **clear the dues of the Food Corporation of India and fertiliser companies** to minimise spillover of deficits to the next year.
- The additional funds can also be used to spend on **much-needed capital expenditure**.

Views of Economists:

- Some economists have welcomed the move as it will help the government counter the shortfall in revenue and tax collection.
- Since inflationary pressure is low, economists believe that the move will not have a negative impact in the long run.
- Another group of economists which include the likes of Raghuram Rajan and former RBI governor Urjit Patel said earlier that the move could put RBI in a vulnerable position apart from diminishing its autonomy.

Conclusion:

The decision of the RBI Board must be welcomed as it has not come a day sooner and should help the government in combating the economic slowdown and to conform to the fiscal targets. It is hoped that the government will be prudent in using these funds.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

Organic Farming in India is an established age-old practice in India, but its ability to redress the grievances of farmers seems to be limited. Critically analyse. (250 words)

[Downtoearth](https://www.downtoearth.org.in)

Why this question:

The question aims to examine the success/achievements that organic farming can bring to farmers and to their income and in what way it has certain limitations.

Key demand of the question:

The answer must discuss the merits and demerits of organic farming.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Describe what is organic farming.

Body:

The answer must justify how India has the highest number of organic farmers globally, but most of them are struggling.

Discuss the factors involved, quote facts such as – India is home to 30 per cent of the total organic producers in the world, but accounts for just 2.59 per cent (1.5 million hectares) of the total organic cultivation area of 57.8 million hectares, according to the World of Organic Agriculture 2018 report.

Explain the issues involved, why farmers are unable to harness the full potential. What needs to be done etc.

Conclusion:

Conclude with way forward.

Introduction:

Organic farming is a technique, which involves cultivation of plants and rearing of animals in natural ways. This process involves the use of biological materials, avoiding synthetic substances to maintain soil fertility and ecological balance thereby minimizing pollution and wastage. FAO suggested that Organic agriculture enhances agro-ecosystem health, including biodiversity, biological cycles and soil biological activity.

Body:

Status of Organic farming in India:

- India is home to **30 per cent of the total organic producers in the world, but accounts for just 2.59 per cent (1.5 million hectares) of the total organic cultivation area of 57.8 million hectares**, according to the **World of Organic Agriculture 2018 report**.
- India is the largest exporter of organic cotton worldwide.
- More than 30% of world's organic producers are in India
- India exporting over 300 products in 20 different categories.
- India exported 1.35 million metric tons of "certified organic" food in the year of 2015-16.
- Oilseeds comprised half of India's overall organic food export, followed by processed food products at 25%.
- Current Indian organic market is estimated at more than Rs. 4000 crore and it is likely to increase to 10,000 to 20,000 crore by 2020.
- Indian organic market has a combined annual growth rate of 25% compared to 16% global growth rate.
- Most organic farmers are struggling due to poor policy measures, rising input costs and limited market, says a study by the Associated Chambers of Commerce and Industry of India (ASSOCHAM) and global consultancy firm Ernst & Young.

Challenges:

- Due to relatively small volumes, the costs of organic food products are relatively high. According to the Indian Council of Agricultural Research, productivity on an average **dips by 6.7 per cent in the first year**, and the government needs to have a plan in place to support farmers during the transition.
- The cost of cultivation increases as it takes more time and energy to produce than its chemical-intensive counterpart.
- **High demand and low supply** has further created an inflationary pressure on organic food products.
- **Pest attack on organic crops** is another reason cited by the farmers for low productivity and demanded education and training to deal with it.
- **Specialised farmer training costs, higher processing and inventory holding costs, and increased packaging, logistics and distribution costs** add to the price of end products.
- The absence of organic food products across all segments in the market is a concern
- There is **low awareness at the producer level** on the difference between conventional farming and organic farming.
- At the consumer level, there is confusion between natural and organic products and limited understanding of the health benefits of organic food products
- Consumers are faced with a plethora of decisions around brands —imported or domestic, product quality, authenticity of claims and certifications.
- Even as farmers are struggling to find a better market, the **existing certification systems for organic food are making things difficult for them**. The certification systems are not only cumbersome and time-consuming, but also expensive.

Way forward:

- Supply-demand mismatch can be eased fundamentally by making organic production mainstream with location-specific hybrid production strategies
- Investments in achieving operations excellence by companies will facilitate lowering the cost of organic food products
- In order to sustain consumer trust, maintaining an accurate audit stream, and preventing cross-contamination with conventional goods would be crucial.
- Consumers should consume responsibly and stakeholders should prevent wastage along the supply chain.
- The Government must rope in agricultural scientists and international research institutions to develop organic herbicides.

- It is critical for companies involved in the organic food business to increase awareness among consumers in non-metro cities
- People across all income groups should have access to organic food.
- Establishing community-supported agricultural farms or with “grow your own food” programmes

Conclusion:

Organic agriculture is the **best insurance policy** that India can have with better performance on productivity, environmental impact, economic viability and social well-being. Focusing only on higher yields at the expense of other sustainability pillars (economics, environment and society) is not the food production system that India needs. What India needs is an integrated system that gives equal importance to all sustainability dimensions across the value chain and thus helps establish a healthy and well-fed society.

Do you think Big data analytics holds potential to bring revolutionary change in Agricultural Industry of the country? Discuss in detail the Role of data analysis in agriculture. (250 words)

Downtoearth

Why this question:

The role of big data analytics in agricultural industry.

Key demand of the question:

The answer must explain the possible role that big data analytics can play in revolutionizing agricultural industry in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief on what is Big data analytics.

Body:

Discussion should include the following:

Explain that in agriculture, big data is often viewed as a combination of technology and analytics that can collect and compile novel data and process it in a more useful and timely way to assist decision making.

Relate the relevance of it to different practices such as precision agriculture, organic farming, ZBNF etc.

Conclusion:

Conclude with way forward.

Introduction:

“Big data” often refers simply to the use of predictive analytics, user behavior analytics, or certain other advanced data analytics methods that extract value from data, and not just to a particular size of data set. Data tools can help determine changes required to maintain yields and meet food demands

Body:

Potential of Big Data in agriculture:

- The availability of data is on the grow because they are increasingly gathered by cheap and numerous information-sensing mobile devices, aerial (remote sensing), software logs, cameras, microphones, radio-frequency identification (RFID) readers and wireless sensor networks.
- In agriculture, big data is often viewed as a combination of technology and analytics that can collect and compile novel data and process it in a more useful and timely way to assist decision making.
- Real-time insights to help performance optimisation advance analytics can show how farmers are utilising their inputs and what adaptations are required to take account of emerging weather events or disease outbreaks.
- For instance, if Black Grass becomes problematic in a given region, suppliers can deploy big data techniques such as real-time micro-segmentation of customers to target promotional and marketing activities, thus facilitating better utilisation of marketing spends.
- Benefits include faster unearthing of valuable insights and the ability to develop and adapt products that meet specific customer needs on an ongoing basis.
- In this range, we can encounter autonomous vehicle devices farmers place in the ground to measure soil moisture and nutrient, predictive weather stations and image-capturing satellites and drones mapping out land and measuring crop health.
- These insights are extremely important since they tell the farmer when and how much to irrigate a field, crop health, weather predictions, pest infestations and even drought conditions.
- Considering the increasing labour shortages in the sector the capacity for big data analysis that lessens the need for physical manpower is of great advantage for agriculture.

Role of Big data in Agriculture:

- **Development of new seed traits:** Access to the plant genome with new ways to measure, map and drive information betters products.
- **Seed Selection:** Big-data businesses can analyse varieties of seeds across numerous fields, soil types, and climates and select the best.
- **Crop disease:** Similar to the way in which Google can identify flu outbreaks based on where web searches are originating, analysing crops across farms helps identify diseases that could ruin a potential harvest.
- **Irrigation:** Precision agriculture aids farmers in tailored and effective water management, helping in production, improving economic efficiency and minimising waste and environmental impact.

- **Weather:** Advanced analytics capabilities and agri-robotics such as aerial imagery, sensors help provide sophisticated local weather forecasts can help increasing global agricultural productivity over the next few decades.
- **Climate change:** Since, climate change and extreme weather events will demand proactive measures to adapt or develop resiliency, Big Data can bring in the right information to take informed decisions.
- **Food tracking:** Use of sensors and analytics to prevent spoilage and food-borne illnesses
- **Food processing:** They help in streamlining food processing value chains by finding the core determinants of process performance, and taking action to continually improve the accuracy, quality and yield of production. They also optimise production schedules based on supplier, customer, machine availability and cost constraints.
- **Effect on supply chains:** Seismic shifts in the supply chain of seed, crop inputs and food driven by the democratisation of technology and information
- **Loss control:** In India, every year 21 million tons of wheat is lost, primarily due to scare cold-storage centres and refrigerated vehicles, poor transportation facilities and unreliable electricity supply. Big Data has the potential of systematisation of demand forecasting thus reducing such losses.
- **Pricing:** A trading platform for agricultural commodities that links small-scale producers to retailers and bulk purchasers via mobile phone messaging can help send up-to-date market prices via an app or SMS and connect farmers with buyers, offering collective bargaining opportunities for small and marginal farmers.

Conclusion:

The big data revolution is in its early days and most of the potential for value creation is still unclaimed. But it has set the industry on a path of rapid change and new discoveries. Stakeholders committed to innovation will likely be the first to reap rewards. If the farmers would have been concerned about the infirmities in terms of data-based farming, production could be increased.

Palm oil easily constitutes over two-third of India's burgeoning vegetable oil import and amidst such huge demand sustainability of palm oil Industry in India lingers to face many tests. Analyse.(250 words)

[Financialexpress](#)

Why this question:

The question is based on the theme of sustainable palm oil industry and the challenges it is facing in the country.

Key demand of the question:

The answer must discuss the challenges being faced by the palm oil industry in the country and what needs to be done to overcome them.

Directive:

***analyze** – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.*

Structure of the answer:

Introduction:

Describe with statistics the palm oil growing regions of the country.

Body:

In recent years, rising incomes, expanding population and extant low per-capita availability have combined to boost India's edible oil consumption.

Then discuss the key problems associated.

Explain in what way with industry backing and consumer awareness, eco-friendly palm oil can find a lucrative market in the country.

Conclusion:

Conclude with way forward.

Introduction:

India is perhaps the biggest market for edible oil. In value terms vegetable oil imports are next only to crude and gold. It is the highest for any food commodity. India's import dependence in this has worsened to over 70%.

Body:

State of Indian Palm Oil:

- Oil palm crop is one of the highest oil (palm oil) yielding crops among the all perennial crops. Oil palm tree produces edible palm-oil as well as palm kernel-oil.
- In cooking oil, India depends on imports for two-thirds of its requirement.
- Domestic production meets three quarters of its annual requirement of 32 million tonnes because of initiatives taken by the present and previous governments
- Annual imports during the past three years have averaged 14.82 million tonnes at \$9.43 billion.
- Though palm oil has a high proportion of unhealthy saturated fats-45% compared to 6% in mustard oil-there is no way India can affordably meets its growing needs without relying on it.
- Annual imports of crude palm oil during the past three years have averaged 6.76 million tonnes, giving it a 46% share of the commodity's imports.
- Soybean and sunflower oils follow at some distance.

Issues facing palm oil industry in India:

- Self-sufficiency is almost impossible with oilseeds because there is **not enough land available**.
- Currently, it covers 3.45 lakh hectares out of a potential area of 19.33 lakh hectares, nearly half of it in Andhra Pradesh.
- Uncertainty of income deters smallholder farmers from investing in a long-gestation crop, which yields fruit after three years of planting for 27 years.

- **Instable prices:** The current monthly price of Fresh Fruit Bunches (FFB) in Andhra and Telangana varies between Rs 7,200 and Rs 8,000 a tonne. A year ago, it went down to Rs 6,000. For farmers to make a profit, the price should be Rs 9,500 a tonne
- **Low productivity** also haunts the industry. India produces five tonnes of FFB per hectare on average.
- **Low yields translate into low capacity utilisation** of the processing plants, which adds to the cost.
- India's **average palm oil yield** is 0.88 tonnes per hectare, compared to Malaysia's four tonnes and Andhra's two tonnes.
- The East Asian country has the advantage of daily rainfall. In India, **irrigation is a big cost**.
- As in sugarcane, oil palm farmers are required to supply to a mill in the vicinity which must pay the price fixed by state governments.
- In the north-east, the **condition of the roads** is such that FFB often cannot be brought to the mills within 24 hours and there is much oozing of oil owing to bumpy rides.

Measures needed:

- To make a dent in the import bill, India must increase palm oil production because oil palms have the highest productivity at 4,000 kg of oil per hectare. In contrast, mustard, which has a high oil content of 35-42%, yields 440-500 kg of oil per hectare at current levels of productivity.
- The government must pay farmers the difference between the normative cost and the actual purchase price.
- Support to farmers for planting materials, inter cropping & maintenance cost for gestation period (4 yrs), bore well, drip irrigation, harvesting tools.
- **Corporations should be allowed** to do oil palm cultivation as they can bear financial risks and do farming scientifically.
- Oil palm would have to be **declared a plantation crop**. This would lift the bar on companies from buying agricultural land.
- The **Commission on Agricultural Costs and Prices (CACP)**, which fixes minimum support prices, had recommended a **mix of smallholder farms and corporate plantations** in 2012.
- Small farmers can give the palms better care. Processing companies should do a better job of extending services to them
- A **ceiling on other vegetable oil import** will reduce the quantum of arrivals and support domestic producers. Ceiling should come with the provision to review it every 6 months, depending on the exigencies of the situation.

- **Import duties should be varied dynamically.** It should be fixed in a way so that imported oils are not cheaper than the MSP for domestic oils.
- **Special focus for promotion of oil palm in all NE states.**
- To meet the planting materials requirement for new plantation both from indigenous and imported sources.
- Capacity building of farmers and extension officials.
- **Assured procurement** of FFBs through processors.
- Supporting oil palm growers through **Market Intervention Scheme (MIS)** to provide remunerative prices of FFBs as and when international CPO price fall below \$ 800 per MT.

Conclusion:

Oil palm crop provides the excellent substitute of importing the oil. There is a need to help farmers of the country to achieve self-sufficiency in pulses and hope that they would repeat the “success” in oilseeds.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

“Providing portability of food security benefits all across the nation through One Nation One Ration Card can prove to be a game changer in the public distribution aspects of the country”. Comment.(250 words)

[Newindianexpress](#)

Why this question:

In a major boost to National Food Security, Government of India launched the One Nation-One Ration Card scheme on a pilot basis in four States namely Telangana, Andhra Pradesh, Maharashtra and Gujarat.

Key demand of the question:

Discuss the key features of the scheme and how it is helping in augmenting the PDS in the country.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Discuss the concept of one nation one card.

Body:

Discuss the following –

Features: Families who have food security cards can buy subsidized rice and wheat from any Fair Price Shop in these states. Their ration cards should be linked with Aadhar Number to avail this service.

Way ahead: The Centre is intended to extend the programme to all states by August next year so that the portability of the food security card implemented. There will also be creation of a Central Repository of all Ration Cards to help national level de-duplication.

Benefits: The national portability of Ration cards will ensure all beneficiaries especially the migrants in getting access to Public Distribution System (PDS) across the nation from any PDS shop of their own choice.

This will provide freedom to the beneficiaries as they will not be tied to any one PDS shop and reduce their dependence on shop owners and curtail instances of corruption.

Conclusion:

Conclude with way forward.

Introduction:

One Nation One Ration Card Scheme which will allow portability of food security benefits will be available across the country from 1st July, 2020. This means poor migrant workers will be able to buy subsidized rice and wheat from any ration shop in the country.

Body:

Highlights of the scheme:

- The poor migrant workers will be able to buy subsidised rice and wheat from any ration shop in the country but for that their ration cards must be linked to Aadhaar.
- Migrants would only be eligible for the subsidies supported by the Centre, which include rice sold at Rs. 3/kg and wheat at Rs. 2/kg, It would not include subsidies given by their respective state government in some other state.
- This scheme will ensure that no poor person is deprived of subsidised grains.
- The scheme can be implemented as already 77% of the ration shops across the country have PoS machines and more than 85% of people covered under the National Food Security Act (NFSA) have their cards linked to Aadhaar.
- For remaining beneficiaries, all the States have been given one more year to use point of sale (PoS) machines in the ration shops and implement the scheme.

Significance of Scheme:

- **For migrant labourers:**
 - India has had food security benefit schemes which have domicile based access.
 - 36 crore people or 37% of the population is that of migrant labourers. The scheme is therefore important for anyone who is going to move from one place to the other.
 - It happens that when one moves from one place to the other (for e.g. a government employee being transferred from one place to another), it takes about two to three months to get a ration card at that next place and then further more time to start getting commodities against the same.

- After the implementation of the scheme, it would be ensured that a migrant is able to access the benefits which are due to him in any part of the country.
- This would be ensured on the basis of Aadhaar authentication and a validated data.
- **For Women:**
 - ONORC will be particularly beneficial for women and other disadvantaged groups, given how social identity (caste, class and gender) and other contextual factors (including power relations) provide a strong backdrop in accessing PDS.
- **Provides Choice:**
 - ONORC will give the beneficiaries the opportunity to opt for the dealer of their choice. If any dealer misbehaves or misallocates, the beneficiary can switch to another FPS shop instantly.
 - ONORC lets the beneficiaries choose the PDS shop that best delivers on the attributes.
- **Curbing corruption:**
 - In ONORC Scheme, the fundamental prerequisite is de-duplication so that it is ensured that the same person does not figure as a beneficiary in two different locations of the country.
 - With the help of the scheme, the government would be able to rightly target the beneficiaries to provide them with the foodgrains under the PDS. The scheme is linked with Aadhaar and biometrics, this removes most possibilities of corruption.
 - The government is creating a **central data repository** to get all the details of ration card which are being maintained by states so that the repository acts as a clearing house or a server to do the cross checking on the basis of Aadhaar authentication.
 - This ensures that there is no corruption or duplication of the benefits that are being passed on to the beneficiaries. The government will ensure all these things with the help of technology.

Challenges:

- Since the scheme is based on technology, the government may face some technical challenges during the implementation of the scheme.
- The scheme will increase the woes of the common man and, the middlemen and corrupt PDS shop owners will exploit them.
- Tamil Nadu has opposed the proposal of the Centre, saying it would result in undesirable consequences and is against federalism.
- Within some states issue of intra state portability.
- Different states have different rates and these mismatching rates will be a big challenge.

- Few regional parties have expressed apprehensions on bearing the cost of additional ration cards. This is a matter which is to be settled between the states and the Government of India.
- One of the apprehensions mentioned by few states is the cost of additional food grain to be supplied to the migrant workers.
- However, the whole system is based on the entitlements mandated under the NFSA and this prevents the charges of additional cost. Beneficiaries will continue to pay the same issue prices that are fixed under the NFSA.
- The quality of services is markedly inferior for the subaltern groups with latent methods of discrimination such as lack of information, mixing of inferior grains, longer waiting time and, at times, even verbal abuse.

Way Forward:

- The food security scheme under the NFSA costs more than Rs 1 lakh crore per year. It is very expensive but is highly needed. There is a need to ensure that subsidized food grains ultimately go to the person or the family that is entitled to.
- The ONORC should also include access to health and other things.
- At the principal level, within the government, there is broad consensus on having a unified kind of service delivery system based on technology and identity.
- A unified service platform combining all the citizen centric services on the basis of few parameters of identity and other indicators of technology, is the need of the hour.
- ONORC combined with a rating system based on the experiences akin to the Uber/Ola system, the government can improve PDS by closer monitoring and control. Those PDS dealers who perform better could be rewarded.

Conclusion:

While ONORC has the potential to improve outcomes particularly for the subaltern groups, like any delivery mechanism, the entire value chain of making the system work needs to be closely monitored and backed by infrastructure. The availability of point of sale (PoS) systems at PDS shops, and its functioning needs to be ensured to check compromises in the entitlements.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

As India becomes a large domestic and international aviation market, the need to create a local leasing community has gained significance. In this context examine the merits and demerits of the move taken by the government for creating a rupee-based leasing industry.(250 words)

Financial Express

Why this question:

The Finance Minister, in her maiden budget, laid the foundation of building an important component of the aviation sector following the release of the 'Rupee Raftaar' report at the Global Aviation Summit in Mumbai in January earlier this year.

Key demand of the question:

The answer must discuss in detail the nuances of the aircraft leasing industry and the potential it holds for India.

Directive:

Examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Discuss the facts /current scenario of Aviation industry.

Body:

The answer must discuss the advantages and disadvantages of creating rupee-based leasing industry in the country.

Explain what all factors would it address, what will be the key objectives etc.

Creating a rupee-based leasing industry will address many objectives: (1) high-skill job creation in financing and across the value chain, (2) retaining economic value in India, (3) offering local savers a new investment class, (4) creating a product more-suited to the needs and requirements of the local industry.

Conclusion:

Conclude with way forward and its significance.

Introduction:

The Finance Minister, in her maiden budget, laid the foundation of building an important component of the aviation sector. As the world's third largest domestic aviation market, the time is ripe for India to enter into aircraft financing and leasing activities from Indian shores. The announcement of this policy statement in the Budget follows the release of the '**Rupee Raftaar**' report at the Global Aviation Summit in Mumbai in January earlier this year.

Body:

Need for rupee-based lending industry:

- In the view of increasing demand and non-availability of own sources of aircraft financing, it is essential for India to set up its own structures for the same.
- Moreover, civil aviation sector is an important sector for development of the economy.
- In the civil aviation industry, aircraft financing is the most profitable segment and there are no entities in the country exploring this line of business.
- All the benefits from this gap are being enjoyed by foreign entities

Merits of Rupee-based lending industry:

- This is critical to the development of a self-reliant aviation industry, creating aspirational jobs in aviation finance, besides leveraging the business opportunities available in India's financial Special Economic Zones (SEZs), namely, International Financial Services Centre (IFSC).

- high-skill job creation in financing and across the value chain
- retaining economic value in India
- offering local savers a new investment class
- creating a product more-suited to the needs and requirements of the local industry.
- Helps create a lot of direct and indirect jobs in the aviation sector.
- Rupee-based lending offers local savers, depositors and investors an opportunity to access aircraft financing which is a liquid and low-default asset class. The local currency leases allow airlines to create a natural hedge on their leasing expenses.

Demerits:

- The development of this industry requires significant contribution from various stakeholders.
- For instance China, in order to attract business away from Ireland, created a specific low-tax dispensation.
- India imposes a wide variety of taxes (stamp duty, import duty, GST, income and capital gains taxes, among others) that require rationalisation.
- Local regulators need to allow long-term financing entities like insurance companies, mutual funds and pension funds to invest in securities of entities engaged in rupee-based leasing.
- Starting an NBFC or an investment trust in the GIFT City will require specific approvals from RBI.

Conclusion:

As India becomes a large domestic and international aviation market, the need to create a local leasing community will increase in importance. With more than a thousand planes on order, India is expected to import more than \$40 billion of equipment (at an average price of ~\$40 million per narrow-body aircraft) over the next decade or so. These numbers are expected to be higher—both on account of growth which will propel further orders and also the inclusion of more wide-body planes as more Indian airlines start their long-haul international operations.

Discuss the significance of Ocean energy as a potential renewable energy in India. (250 words)

[The hindubusinessline](#)

Why this question:

The Ministry of New and Renewable Energy has declared Ocean Energy as renewable energy. Thus, it is important from the point of view of GS paper III to examine the merits of ocean energy and its potential.

Key demand of the question:

The answer must write a short note on ocean energy as a potential renewable energy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief introduction on ocean energy.

Body:

The question is straightforward and nothing much to deliberate. One must categorically discuss ocean energy as the renewable energy.

Discuss the significance of such an energy – vastness, ease of use etc. Oceans cover more than 70% of Earth's surface, making them the world's largest solar collectors.

The sun's heat warms the surface water a lot more than the deep ocean water, and this temperature difference creates thermal energy. Just a small portion of the heat trapped in the ocean could power the world.

Ocean energy is currently under-utilized and as on date, India does not have any installed ocean energy capacity. It is mostly exploited through a few technologies including wave, tidal, current energy and ocean thermal energy.

Conclusion:

Conclude with way forward.

Introduction:

Oceans cover 70 percent of the earth's surface and represent an enormous amount of energy in the form of **wave, tidal, marine current and thermal gradient** known as Ocean energy. A variety of different technologies are currently under development throughout the world to harness this energy in all its forms. The government has approved a proposal to declare ocean energy as Renewable Energy.

Body:

Potential of Ocean Energy in India:

- Total identified potential of **Tidal Energy** is about **12455 MW**, with potential locations identified at **Khambhat & Kutch regions**, and large backwaters, where **barrage technology** could be used.
- The total theoretical potential of **wave energy in India** along the country's coast is estimated to be about **40,000 MW** – these are preliminary estimates. This energy is however less intensive than what is available in **more northern and southern latitudes**.
- **Ocean Thermal Energy Conversion** has a theoretical potential of **180,000 MW** in India subject to suitable technological evolution.

Various means of Ocean Energy:

- Oceans are literally throbbing with energy.
- There are at least several sources of energy in the seas.
- One is the **bobbing motion of the waters**, or **ocean swells** — you can place a flat surface on the waters, with a mechanical arm attached to it, and it becomes a pump that can be used to drive water or compressed air through a turbine to produce electricity.

- Another is by tapping into **tides**, which flow during one part of the day and ebb in another. You can generate electricity by channelling the tide and place a series of turbines in its path.
- One more way is to keep turbines on the sea bed at places where there is a **current** — a river within the sea.
- Yet another way is to get the **waves dash against pistons** in, say, a pipe, so as to compress air at the other end.
- Sea water is dense and heavy, when it moves it can punch hard — and, it never stops moving.

Significance of Ocean Energy:

- The world today needs more energy than it ever required. The growing population along with the growing industries requires more and more sources of energy.
- They have become inevitable in our daily life. However we also need to take care of the fact that this consumption should not affect much of the ecological balance of the planet.
- Given fluctuating fuel prices and the impact of global warming, Ocean Energy is now in a very strong position to commercialise the vast body of research and development it has invested in over the past 10 years.
- The sea is a limitless source of power and is a challenging environment, so in order to exploit wave energy commercially there are a number of key components required.
- Unlike wind, solar and other ocean energy sources such as wave power, tides and ocean currents are almost 100 percent predictable. The endless flows create reliability of the future energy availability.
- Moving water is 832 times denser than moving air, which multiplies the kinetic energy by the same factor, making oceans a energy-rich source.
- In many regions, land is a scarce resource. Therefore, on-shore solutions such as wind and solar compete with other users. Subsea ocean energy technologies are hidden in the depth of the ocean, out of sight and do not compete for land space.
- However, the deployment is currently limited but the sector has the potential to grow, fuelling economic growth, reduction of carbon footprint and creating jobs not only along the coasts but also inland along its supply chains.

Conclusion:

Ocean energy is renewable energy sector that surely needs more research to satisfy condition of cost-effectiveness which is at this point its biggest flaw. Since oceans cover almost two thirds of earth's surface, they truly present renewable energy source with extreme potential and one worth of further exploration.

Do you think a cooperative federalism framework can provide the required impetus to the civil aviation sector in the country? Examine.(250 words)

The hindu

Why this question:

The article discusses the significance of cooperative federalism to Indian civil aviation industry.

Key demand of the question:

One must discuss in detail the current problems facing civil aviation industry in India and in what way cooperative federalism framework can bring impetus to it.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

In short define what is cooperative federalism.

Body:

Explain that civil aviation is a Central subject and one that barely got significant attention from the States until recently. It is evident from the fact that very few States in India have active civil aviation departments. This is also due to the reason that States have had a passive role, invariably, having had to look up to the Central government for the development of airports and enhancing air connectivity. However, in the last four years, the situation has changed considerably.

The cooperation of States is seen as a major factor in the growth of the civil aviation sector. The Regional Connectivity Scheme, UdeDeshkaAamNaagrik (UDAN), has become a game changer as this flagship programme has a built-in mechanism to develop stakes of State governments in the growth of the sector.

Conclusion:

Conclude with significance of cooperative federalism and the impetus that it can bring.

Introduction:

Cooperative federalism, also known as **marble-cake federalism**, is a concept of federalism in which federal, state, and local governments interact cooperatively and collectively to solve common problems, rather than making policies separately but more or less equally. It reflects the relationship between centre and state where they both come together and resolve the common problems with each other's' cooperation.

Body:

Current status of Civil Aviation in India:

- **Civil Aviation**, being a **central subject**, gets little attention from states.
- It is evident from the fact that very few States in India have active civil aviation departments.
- The **Regional Connectivity Scheme, Ude Desh ka Aam Naagrik (UDAN)**, has become a game changer as this flagship programme has a built-in mechanism to develop stakes of State governments in the growth of the sector.
- The **penetration of aviation market** in India stands at **7%**. There is potential to be among the global top three nations in terms of domestic and international passenger traffic.

Challenges faced by civil aviation sector:

- **High VAT on ATF:** States have very high rates of value-added tax (VAT) on Aviation Turbine Fuel, sometimes as high as 25%, which has dampened the growth trajectory of civil aviation. For any airline in India, the cost of Aviation Turbine Fuel (ATF) forms about 40% of the total operational cost.
- **Acquisition of land:** Land involves huge capital and is a scarce resource.
- Policy reluctance due to **financial non-viability** of the models to connect remote areas.
- **Capital intensive nature** of airline industry disincentivises the airlines to start operations in such areas where there is **lack of enough passenger traffic** to make them profitable.
- **Fundraising for Viability Gap Funding (VGF)** poses a major challenge.

Key policy interventions necessary to jump-start the aviation market:

- **Relief on ATF:** The airline industry is capital-intensive and works on very thin profit margins. Therefore, relief on ATF is a major incentive for airlines to augment their operations.
- For States, it would be a notional revenue loss which can be offset by enhanced economic activities as a result of increased air connectivity to the region.
- **Development and management of airports:** There are many regional airports which can be developed by States on their own or in collaboration with the Airports Authority of India (AAI).
- **PPP model:** There have been different models of public-private-partnership which can be leveraged to develop infrastructures.
- **Create 'no-frill airports':** Innovative models can be explored to create viable 'no-frill airports'. These functional airports can open up regions and change the way people travel.
- **Linking the hinterland:** States and the Central government can play a crucial role in supporting airlines to develop air services in the remote regions.
- Considering the infrastructural constraints and difficult terrain, small aircraft operators need to be encouraged.
- Areas which cannot be connected meaningfully by road or rail have to be linked by air.
- States can **converge their relevant schemes** relating to tourism, health, and insurance for supporting air connectivity to supplement the objectives of regional connectivity.
- For this States need to create a conducive business environment to facilitate the strong aspirations of a burgeoning Indian middle class to fly at least once a year.

Conclusion:

Developing airports, incentivising airlines and pooling resources of both the Union and State governments can accelerate the harmonised growth of the Indian civil aviation sector which would be equitable and inclusive.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

What is a cryptocurrency? Discuss the feasibility of a national cryptocurrency in India.(250 words)

The hindu

Why this question:

Recently, a government panel headed by senior bureaucrat Subhash Chandra Garg placed in the public domain a draft bill calling for a complete ban on private cryptocurrencies in India. The panel recommended a fine of up to ₹25 crore and a jail term of up to 10 years for anyone found to be owning or handling private cryptocurrencies. Thus, the question.

Key demand of the question:

The question aims to analyse the concept of cryptocurrency and its feasibility as a national currency.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief on what is a cryptocurrency – “any information or code or number or token not being part of any official digital currency, generated through cryptographic means or otherwise, providing a digital representation of value which is exchange with or without consideration, with the promise or representation of having inherent value in any business activity which may involve risk of loss or an expectation of profits or income, or functions as a store of value or a unit of account and includes its use in any financial transaction or investment, but not limited to, investment schemes.”

Body:

Discussion should include the following:

Explain the context of the question – Inter-Ministerial Committee on Virtual Currencies headed by finance secretary Subhash Chandra Garg has submitted its report to the government. The committee set up by Centre has also proposed a draft bill ‘Banning of Cryptocurrency & Regulation of Official Digital Currency Bill, 2019’.

Discuss what are the key recommendations made, discuss pros and cons and form a fair and balanced opinion as to whether the currency should be allowed or banned completely.

Conclusion:

Conclude with way forward.

Introduction:

A cryptocurrency is a digital or virtual currency that uses cryptography for security. Cryptocurrencies use decentralized technology to let users make secure payments and store money without the need to use their name or go through a bank. They run on a distributed public ledger called blockchain, which is a

record of all transactions updated and held by currency holders. The most common cryptocurrencies are Bitcoin, Ethereum, Ripple, and Litecoin.

Facebook has announced a digital currency called **Libra** that will roll out for use in 2020 and allow the platform's billions of users across the globe to make financial transactions online.

Body:

Current state of Cryptocurrencies:

- Experts and central banks across the world are slowly arriving at the conclusion — written about in various research papers but not yet implemented in policy — that cryptocurrencies are here to stay.
- The world's premier cryptocurrency is within sniffing distance of \$9,000 apiece, and investors still seem bullish on it.
- The current value—at \$8,918 on 29 May—is below its peak of \$19,600-plus in late 2017, which was achieved after an exponential rise all through that year.
- That ascent took online traders by storm and stoked fears of a tulip mania-like “bubble” just before it crashed dramatically; by the end of 2018, it had slid to about one-fifth of its peak value.
- Bitcoin's market capitalization is now over \$150 billion, reportedly.
- India banned crypto-currencies in 2018, shortly after a Chinese clampdown.

Cryptocurrency is a disrupter to traditional notions of currency:

- The government is wary that regulation will provide legitimacy to “what is currently ambiguous,” and may lead to further rise in its valuation and end up contributing “to the investment bubble”.
- A currency that is not based on any real economic activity, unlike a sovereign currency whose value is based on the relative value of a tradeable basket of goods and services, cannot *prima facie* inspire much comfort.
- Bitcoin's value, astronomical even now at about \$8,300 but much below January 2018's stratospheric levels, is based on demand for a fixed supply of Bitcoins in the future it cannot exceed 21 million in number, of which 18 million has already been mined.
- The security offered by encryption of cryptocurrency may be breached by hackers who are always lurking for any point of weakness. This may end up costing investors huge amounts of money because prices are attached to the currencies.
- Cryptocurrency exists only in essence such that there are no physical coins and notes. As a result, there is, therefore, no central place where the currency can be deposited for safe keeping.

- Lack of regulation of cryptocurrency means it is not under any control or supervision. This attracts more investors thereby increasing their chances of investing in this technology.
- Cryptos are feared not just for their sheer speculative propensities, but also for their capacity to undermine sovereign currencies (the latter is an exaggerated apprehension).
- Virtual currency is being traded anonymously over the Internet and used for a host of anti-national and illegal activities, from terror funding to illicit trade of arms and drugs and so on.
- The online use of this currency, was without any border restrictions or geographical constraints, resulting in danger to the integrity and sovereignty of the nation.
- However, it does not make sense to go overboard and criminalise merely adventurous crypto speculators. There are no official or other data available that point towards misuse of cryptocurrencies for illegal ends

However, there are a **few advantages of cryptocurrencies**:

- One of the reasons why cryptocurrencies have gained global appeal is because of their secure nature. Cryptocurrencies are encoded into a database.
- Cryptocurrency trading draws its legitimacy from the unanimity of the participants in its network. It has gained global approval by most leaders as a legal medium of payment.
- No transaction fees are usually charged for transactions involving cryptocurrency.
- Cryptocurrency does away with the need for a regulator.
- By making everything public, cryptocurrency negates the need for a middleman.
- According to bitcoin.org, no individual or organisation can manipulate Bitcoins because it is cryptographically secure and do not contain customers' personal information.

Measures needed:

- Governments the world over have banned cryptocurrencies as a medium of exchange, and India is no exception.
- Yet in India, an estimated 30 lakh Bitcoins are reportedly in circulation. From a value of a little over ₹60,000 at the start of 2017, the Bitcoin now commands a value of nearly ₹6 lakh, with a global market cap of \$10.2 trillion. Cryptos are recognised in the US as an asset class.
- Firms like Paypal, Uber, Visa and Mastercard have all signed up as part of the consortium to control it. Each has invested \$10 million.
- Criminalising possession of cryptocurrencies will impact such investments.
- Bankers and investors now consider the cryptocurrency market at par with derivatives. The NYSE plans Bitcoin futures through a platform called **Bakkt**.

Conclusion:

Underlying the crypto movement is a libertarian belief: Cryptos are an alternative asset to fiat currencies; controlled by none, they cannot be manipulated by governments with vested interests. Legalising the cryptomarket can help beneficiaries emerge from the shadows and make productive investments in an economy witnessing a digital transformation. Crypto conduct calls for regulation, but not outright criminalisation.

Discuss the significant contributions of Vikram Sarabhai in building India's space program.(250 words)

The hindu

Why this question:

12th August was 100th birth anniversary of scientist and innovator Vikram Sarabhai. Dr. Sarabhai is considered as the father of India's space program, and his centenary comes just weeks after India's Chandrayaan-2 mission to the moon.

Demand of the question:

Explain in depth the contributions made by Dr. Sarabhai.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

Bring out importance of such personalities in bringing space technology to the current conditions and stature in India.

Body

From the article take cues and discuss the specific contributions made by Dr Vikram Sarabhai to the Indian space technology – Dr. Sarabhai established the Indian National Committee for Space Research in 1962, which was later renamed the Indian Space Research Organization (ISRO). He helped set up the Thumba Equatorial Rocket Launching Station in Thiruvananthapuram, with its inaugural flight in November 1963. He pioneered the setting up of several institutions, such as the Indian Institute of Management in Ahmedabad, Community Science Centre etc.

Conclusion

Conclude with reassertion of the extraordinary contributions made by him.

Introduction:

Dr. Vikram Sarabhai is widely credited as the father of India's space programme. But the dashing scientist was so much more – some of India's most celebrated institutions today, from the Indian Institute of Management-Ahmedabad to the Indian Space Research Organisation, stand testament to his enduring legacy.

Body:

Contributions of Dr. Sarabhai:

- By 1962, with the aim to formulate India's space programme, he had been appointed the **founding chair of INCOSPAR**, which became the Indian Space Research Organisation (ISRO) in 1969.

- He successfully convinced the government of the importance of a space programme for a developing country like India after the Russian Sputnik launch.
- **Homi Jehangir Bhabha**, widely regarded as the **father of India's nuclear science program**, supported Dr. Sarabhai in setting up the first rocket launching station in India. This center was established at Thumba near Thiruvananthapuram on the coast of the Arabian Sea, primarily because of its proximity to the equator.
- As a result of Dr. Sarabhai's dialogue with NASA in 1966, the **Satellite Instructional Television Experiment (SITE)** was launched during July 1975 – July 1976.
- Sarabhai started a project for the fabrication and launch of an Indian Satellite. As a result, the first Indian satellite, **Aryabhata**, was put in orbit in 1975 from a Russian Cosmodrome.
- Sarabhai was very interested in science education and founded a Community Science Centre at Ahmedabad in 1966. Today, the Centre is called the **Vikram A Sarabhai Community Science Centre**.

Some of the most well-known institutions established by Dr. Sarabhai are:

- Physical Research Laboratory (PRL), Ahmedabad
- Indian Institute of Management (IIM), Ahmedabad
- Community Science Centre, Ahmedabad
- Darpan Academy for Performing Arts, Ahmedabad (along with his wife)
- Vikram Sarabhai Space Centre, Thiruvananthapuram
- Space Applications Centre, Ahmedabad (This institution came into existence after merging six institutions/centres established by Sarabhai)
- Faster Breeder Test Reactor (FBTR), Kalpakkam
- Variable Energy Cyclotron Project, Calcutta
- Electronics Corporation of India Limited (ECIL), Hyderabad
- Uranium Corporation of India Limited (UCIL), Jaduguda, Bihar

Conclusion:

Dr. Sarabhai emphasized the importance of a space program in his quote: **“There are some who question the relevance of space activities in a developing nation. To us, there is no ambiguity of purpose. We do not have the fantasy of competing with the economically advanced nations in the exploration of the moon or the planets or manned space-flight.”**

For his visionary work in the field of space science, this scientist was decorated with two of India's most honourable awards: **the Padma Bhushan (1966) and the Padma Vibhushan (awarded posthumously in 1972).**

In times when man has sent rovers to Mars and sent Spacecrafts beyond our solar system, why is there a resurgent interest in the moon? Discuss. (250 words)

Indianexpress

Why this question:

The article discusses in detail the reasons for resurgent interest in the moon.

Key demand of the question:

One must list down the possibly causes of Why is there a resurgence in interest in Moon.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the significance of space missions.

Body:

Take hints from the article and list down causes as to despite multiple efforts made by the world countries the mission to moon have remained an unfinished agenda and thus there is dire need to resurge upon.

Conclusion:

Conclude with way forward.

Introduction:

July 20, 2019 marked the fiftieth anniversary of man's first landing on the Moon, "a giant leap for mankind", as Neil Armstrong described it. After the discovery of water on Lunar surface by Chandrayaan-1, there is a renewed surge of interest in moon travel is both an indication of the complexities of lunar missions and a future foretold.

Body:

Earlier Lunar missions:

- The Apollo missions to the moon were hardly guided by science objectives. They were driven mainly by geo-political and nationalistic considerations.
- The Apollo landing so early in our space age was, no doubt, **an outcome of Cold War rivalry**. It was all about seeking dominance in space. Resources were mobilised on a war-scale.
- There was huge amount of scientific information that came out of those missions. The rocks and other samples that the astronauts returned with were a wealth of information.
- One after the other, NASA landed six Apollo spacecraft on the moon, each carrying two astronauts with it, before abandoning the extremely expensive programme in 1972.
- Beaten in the race, the USSR, which was preparing feverishly to take a man to the moon, too, lost interest in just emulating the US and dropped its plans.
- All information about the moon at that time, gleaned from the rock samples brought back by the astronauts, as well as from other studies, pointed to moon having a bone-dry surface, **bereft of any water**.

- If human beings had to build a permanent scientific station on the moon, they would have to carry not just all their material from the earth, but also water.

Resurgence in Lunar missions:

- The scientists' perception of the moon changed considerably once traces of water molecules were discovered.
- In the 1990s, both the Clementine and the Lunar Prospector, the two NASA missions that restarted lunar exploration, picked up signals of water on moon. So did the Cassini mission in 1998, which flew by the moon on its way to Saturn.
- But the **conclusive evidence of the presence of water on the moon was delivered by two instruments on board Chandrayaan-1 — the Moon Mineralogy Mapper** placed by NASA, and ISRO's own **Moon Impact Probe** that was made to crash on the moon's surface.
- The discovery of water changes everything. It gives rise to a host of possibilities. It is this discovery of water that has triggered all the space faring nations to start looking at moon again
- In addition to the sustenance of life, water could also be utilised as a fuel to power rockets for deep interplanetary missions.

Potential outcomes of future lunar missions:

- **Fuel:** Water can be broken into hydrogen and hydroxide molecules. Hydrogen can be used for power generation as well as a propellant to in rockets.
- **Launch pad:** In the long run, if we are to use moon as a launch pad for going further into space, then we would need to develop technologies to extract hydrogen from the water on the moon and use it as a fuel.
- **Creation of New objects:** We have technologies that now make it possible to build in-situ, on the surface of the moon, using materials found there. We have 3-D printing technologies to achieve this.
- **Nuclear fusion fuel:** It is also very much in the realm of possibility to extract and use hydrogen as an energy source, or even the Helium-3 which is abundantly available on the moon, as a source of immense energy in nuclear fusion reactors.
- **International lunar space station:** to create a permanent space station, like the ISS, on the surface of the moon in the next 10 years. The ISS that serves as a permanent laboratory in space, about 400 km above the earth's surface, is due to retire latest by 2028, and no replacement for it has been decided as yet.

Conclusion:

The stage is now set again for a race to the moon over the next decade, and, this time, it is likely to be markedly different from the earlier one. In all probability, it will **involve multiple participants, be more collaborative than competitive**, and will be **guided by the overall objective of utilising the resources of**

the moon, setting up permanent facilities for scientific explorations and using it as a launch pad to take humans deeper into space.

What are Biosimilars? How are they different from Generic drugs? Discuss the possible prospects they hold for the Indian pharma industry.(250 words)

Why this question:

Pharma major Dr. Reddy's Laboratories Ltd has launched 'Versavo (bevacizumab)', a biosimilar of Roche's Avastin in India. The drug is for the treatment of several types of cancers.

Key demand of the question:

The answer must detail upon the concept of Biosimilars, compare them with Generic drugs and discuss the potential they hold for Indian Pharma Industry.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Introduce by explaining what are Biosimilars – A biosimilar is exactly what its name implies — it is a biologic that is “similar” to another biologic medicine (known as a reference product).

Body:

Discussion should include the following:

Biosimilars are ‘similar biologic drugs’, clinically equivalent, in terms of safety and efficacy, to biologic medicines. When the patent surrounding an original biologic’s formula is no longer protected, others companies can release cheaper biosimilars with no clinically meaningful differences.

Biosimilars v/s Generics – Nature of the drug, Manufacturing and testing, functioning etc.

Discuss significance – first explain issues plaguing Indian pharma industry and in what way Biosimilars can aid to fix issues.

Both Biosimilars and generic drugs are hugely important for affordable healthcare, and in recognition of this, Indian patent laws provide stringent protections against the practice of ‘evergreening’ by original drug manufacturers.

Conclusion:

Conclude with way forward.

Introduction:

A biosimilar is a **biologic medical product that is almost an identical copy of an original product that is manufactured by a different company**. Biosimilars are **officially approved versions of original “innovator” products** and can be **manufactured when the original product’s patent expires**. Biosimilars are the generic versions of biologics medicines made from animal or plant proteins as opposed to chemicals.

Body:

Difference between biosimilars and generics:

- **Biosimilars** involve developing **equivalent of biological entity** while **generics** involve developing **equivalent of a chemical entity-the Active Pharmaceutical Ingredient**.
- In case of biosimilars, biological entities being some ward different (and not as it is of replica), every organism has to be engineered to produce the same therapeutic effect while in generics, the copies of API can be generated
- Bio-similars differ from generics – in complexity, in the manufacturing processes and in the data needed to demonstrate similarity for approval. The structure of Generic Simple and well-defined whereas for Bio-similar its Complex with potential structural variations.
- Regulatory procedure to get approval for biosimilars is complex as compared to that of a generic.

Prospects of Biosimilars:

- The growth of the biologics market for the treatment of cancer (monoclonal antibodies), diabetes (insulin) and many other auto-immune diseases has in turn resulted in creating a global opportunity for biosimilars also.
- Many Indian pharma companies are now making substantial investments into biosimilar development and production for gaining the first mover advantage.
- In 2014, Zydus Cadila became the first company in the world to launch the biosimilar of Adalimumab patented by the US drug major AbbVie, which is being used to treat rheumatoid arthritis and other auto immune disorders.
- As the biologics are priced very high, it is necessary for countries to reduce prices through biosimilars.

- The growth in the biosimilars market is welcome from a human development standpoint because they are more affordable than biologics, the high cost of which often puts them out of reach of many patients.
- In recent times, patents of some biologics have expired and more will expire before 2020. So moving towards biosimilars can fill the gap.
- Targeted towards Non-communicable diseases (cancer, asthma, and arthritis):
 - There is an alarming spike across developing countries in the prevalence of non-communicable diseases.
 - Therefore, promoting the production of complex generics and biosimilars can have a positive development impact given how targeted they are toward treating non-communicable diseases such as cancer, asthma, and arthritis.
- Biosimilars industry can act as a springboard for the pharma companies to innovate, excel and earn profit

Challenges faced:

- The development is itself lengthy and expensive, and could cost more than Rs 100 crore and take up to six or seven years.
- It is hard to generate investor interest if a product hits the market only after seven years. So, India is unlikely to see startups in biosimilars, which could also drive consolidation of some players.
- Expertise in biology is essential, and this subject does not yet have critical mass in India. India has fewer research labs in biology than a big state in Europe or the US. And, yet, things have improved in the last ten years, as experience has built up in technology and regulation.

Way forward:

- Governments can support growth in this segment by clarifying the regulatory framework for them, which is still evolving in many countries. China is a recent example, where the government has identified biopharma, including biosimilars, as a priority area for the country.
- India has to expand the biology research ecosystem by investing in education and fundamental research.
- At the same time, a regulatory mechanism needs to be put in place and appropriate monitoring needs to be done to ensure that unfair and unethical practices are abstained from in preparation of biosimilars.

The evolution of the mobile phone to smartphone has brought about a radical change in our everyday life, discuss how much more, and how much quicker can social robots shift societal paradigms? How should we prepare ourselves to meet the AI and social robotics revolution? Examine.(250 words)

Livemint

Why this question:

The question is based on the theme of societal effects that the robotics and AI are bringing into the society of today.

Key demand of the question:

One must discuss in detail the impact of social robots on the world society in detail.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Set the context of the question briefly.

Body:

Explain that the question “man or machine?” has been replaced with “man and machine”.

Discuss and opine whether humanoids can go beyond the industrial world to become part of our personal lives.

Discuss the case studies of humanoid robots – Sophia and Han.

Explain in what way robots can impact the society. Give case studies from the article and substantiate to form a stand.

Conclusion:

Conclude with significance of AI and robotics and its potential and that however the ethical concerns related to it remain a grey area that require diligence.

Introduction:

Advances in artificial intelligence (AI), machine learning (ML) and natural language processing (NLP) have enabled humans to create humanoid news anchors, psychologists, personal assistants, and more. While we are yet to see a fully-functional humanoid robot become mainstream, the day is not far away.

Body:

The question “man or machine?” has been replaced with “man and machine”. The interesting possibility, however, is whether humanoids can go beyond the industrial world to become part of our personal lives.

Social robots and shift in societal paradigms:

- **Geriatric care:** The Japanese government has moved in early on this possibility, and is funding the development of care robots for the elderly. Tokyo’s Shin-tomi nursing home already deploys 20 types of robots for such care.
- **Personal use: Samsung’s Bot Care**—enables users to check their blood pressure, heart rate and sleep patterns. It also reminds them to take medications, alerts family members in case of emergencies. Bot Air assesses air quality and takes remedial measures.

- **Shopping: Bot Retail** offers support to customers while shopping. **Piaggio's Gita** is a cargo bot that can be used as an autonomous shopping trolley
- **Help for disabled:** The **GEMS (Gait Enhancing and Motivating System)** exoskeleton supports people who have trouble walking, running or standing up, and prevents overworking of their muscles.
- non-humanoid social robots are crossing the experimental stage to mass production. MiRo is one of the world's first robots that has a brain-inspired biomimetic operating system.

Humanoids influence on Humans:

- Research strongly indicates that as humans we can be influenced by robots, much like we are by fellow humans.
- True, we develop robots with our knowledge and mastery over the human mind.
- The recent instance of Facebook having to shut down its AI engine (after it was found it had developed its own language that could not be understood by humans) does venture into the grayer and darker side of AI.
- The fear of loss of jobs due to increased robotization.
- AI powered bots have also been used to influence humans perceptions, views and opinions. Such activities are rampantly being promoted through social media platforms for various ulterior purposes using fake news, unethical advertisements, etc which then have huge negative consequences.
- AI based weapons are fast gaining currency. Since humans can be replaced by such machines, declaring war would become more convenient. These machines can wreck havoc if uncontrolled endangering the human race itself.
- AI is being used for extensive surveillance as in China which violates right to privacy. Such intelligence can be even used to selectively target and eliminate opponents which instil deep fear among people who would like to raise voice against injustice.
- Humans can pass on their limitations to robots. E.g.: biases, prejudices, discrimination, etc. A recent report in USA revealed that robot can be racist

Measures needed to meet the AI and social robotics revolution:

- With the proliferation of AI, it is important for us to know the ethical basis of every AI system that we use or is used on us.
- Sometimes, even an inclusive intention may need careful scrutiny.
- Ethical norms regarding uses of AI and our ability to regulate them in an intelligent and beneficial manner should keep pace with the fast changing technological capabilities.
- Understanding and discussing the ethical basis of AI is important for India.

Conclusion:

The transformative capability of AI in India is huge, and must be rooted in an egalitarian and humanitarian basis. Any institutional framework for AI should have a multidisciplinary and multi-stakeholder approach, and have an explicit focus on the ethical basis.

The idea of providing Biometric Seafarer Identity Document (BSID) by Government of India is an accomplishment in the field of science and technology and is valuable on multiple fronts. Discuss.(250 words)

Livemint

Why this question:

India recently became the first country to launch world's first facial biometric-based ID for seafarers.

Key demand of the question:

One must discuss in detail the achievement India has made through the launch of such a technology that can have positive impacts in multiple dimensions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First explain the importance of identification to Indian seafarers.

Body:

Explain that in a move to boost employment in the coastal shipping sector, India has become the first country in the world to issue a Biometric Seafarer Identity Document (BSID) to its seafarers.

Discuss the key features of BSID – The BSID has the dimensions of a smart ID card. It introduces modern security features like an embedded biometric chip, as well as optical security features such as micro prints/micro texts and Unique Guilloche pattern. The security of the BSID card is ensured at various levels and through different methods. At the time of data capturing the live face is cross matched through passport photo using a face matching software. A software has been developed for capturing the facial biometrics and its authentication through the public key infrastructure.

Explain how the technology is a major boost in various ways to the seafarers.

Conclusion:

Conclude with significance.

Introduction:

India recently became the first country to launch **world's first facial biometric-based ID for seafarers (BSID)**. The new document will give a **foolproof identification to Indian seafarers** which will facilitate their movement and help in identifying them from any location in the world. The new card is in confirmation of the Convention No. 185 of the International Labour Organisation on BSID. India ratified the Convention in October 2015.

Body:

BSID project:

- In India the BSID project has been taken up in collaboration with Centre for Development of Advanced Computing (CDAC), Mumbai.

- The Government notified the **Merchant Shipping (Seafarers Bio-metric Identification Document) Rules** in 2016.
- Every Indian seafarer who possesses a valid Continuous Discharge Certificate issued by the Govt. of India will be eligible for issue of a BSID.
- Nine data collection centers have been setup at Mumbai, Kolkata, Chennai, Noida, Goa, New Mangalore, Kochi, Vizag & Kandla for issue of BSID.

Working of BSID:

- It introduces **modern security features**.
- It will have a **biometric chip embedded in it**.
- The security of the BSID card is **ensured at various levels and through different methods**.
- At the time of data capturing, the live face is cross matched through passport photo using a face matching software.
- The card has **two optical security features- Micro prints/micro texts and Unique Guilloche pattern**.
- A software has been developed for capturing the facial biometrics and its authentication through the public key infrastructure.

Significance of BSID:

- The BSID with new facial biometric technology is a marked improvement over the two finger or iris based bio-metric data, with modern security features.
- It will make the identification of the SID holder more reliable and efficient, while **protecting their dignity and privacy**.
- It will give a **foolproof identification to our seafarers** which will **facilitate their movement, provide ease of getting jobs and help in identifying them from any location in the world**.
- A record of each SID issued will be maintained in a national database and its **related information will be internationally accessible**.
- The total number of Indian seafarers who were employed on Indian or foreign flag vessels increased from 154349 in 2017 to 208799 this year, showing an unprecedented increase of 35%

Conclusion:

With Sagarmala on the anvil and security of the long coastline of India, BSID will help secure the seafarers as well as safety of India from transgressors.

Conservation, environmental pollution and degradation, environmental impact assessment

A combination of increased urbanization, climate change and weak infrastructure is rapidly depleting water supply in cities across the country, discuss the various causes leading to such a crisis in Indian cities along with suggestions to overcome the same. (250 words)

[livemint](#)

Why this question:

The article discusses in detail in what way the Indian cities are dealing with water crisis.

Key demand of the question:

Discussion should be about the problems in Indian cities related to water crisis.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Quote the recent incidences depicting the water crisis situations in the cities.

Body:

The article very well captures how and why Indian cities are facing water issues and if not addressed in time the situation may get even worse.

Explain the interlinkages between water crisis and other factors that are contributing to it.

Take hints from the article and organize your answer according to the context of the question.

Conclusion:

Conclude with suggesting solutions to the problem.

Introduction:

The **NITI Aayog report on Composite Water Management Index (CWMI)** said that India is facing its 'worst' water crisis in history. Taps in Shimla went dry in summer of 2018, posing an unprecedented water crisis in the hill town. According to a forecast by the Asian Development Bank, India will have a water deficit of 50% by 2030. Recent studies also ranked Chennai and Delhi at the top of the 27 most vulnerable Asian cities in terms of low per-day water availability Mumbai and Kolkata follow close.

Body:

India's water crisis is more serious than its energy crisis:

- The water crisis in India is more dire than imagined.
- The annual per capita availability of water continues to decline sharply from about 5,177 cubic metres in 1951 to about 1,720 cubic metres in 2019.
- The NITI Aayog in its report on Composite Water Management Index (2018) has underlined that currently 600 million people face high to extreme water stress.
- Twenty-one cities, including Delhi, Bengaluru, Chennai and Hyderabad will run out of groundwater by 2020, affecting 100 million people.

- Apart from mega cities, many fast-growing small and medium cities such as Jamshedpur, Kanpur, Dhanbad, Meerut, Faridabad, Visakhapatnam, Madurai and Hyderabad also figure in this list.
- The demand-supply gap in most of these cities ranges from 30 per cent to as much as 70 per cent.
- About two lakh die every year due to inadequate access to safe water, about three-fourths of the household do not get drinking water at their premise and about 70 per cent of water is contaminated.
- The rate of groundwater extraction is so severe that NASA's findings suggest that India's water table is declining alarmingly at a rate of about 0.3 metres per year.
- At this rate of depletion, India will have only 22 per cent of the present daily per capita water available in 2050, possibly forcing the country to import water.
- About 81 per cent of India's ultimate irrigation potential, estimated at 140 million hectares, has already been created and thus the scope for further expansion of irrigation infrastructure on a large scale is limited.
- Climate experts have predicted that there will be fewer rainy days in the future but in those days it would rain more.

Causative factors for water crisis:

- A combination of population explosion, unplanned growth of the city and its expansion to some traditional catchment areas (a region from which rainfall flows into a river, lake, or reservoir) have led to a reduction in the natural flow of water, and large-scale deforestation.
- Climate change, leading to much lower precipitation during the winter months. As a result, the natural flow and recharge of water in the region has fallen sharply
- Failure of State governments to check unplanned development and exploitation of water resources. There is no attempt at the central or state levels to manage water quantity and quality
- The vegetation pattern has changed, tree cover is shrinking and unscientific dumping of debris in water streams is rampant.
- The debris blocks the natural course of water bodies.
- Increasing number of tube wells resulting in depletion of groundwater.
- Changes in farming patterns lead to consumption of more water for irrigation and also change the soil profile because of the use of fertilizers
- The states ranked lowest like Uttar Pradesh, Haryana and Jharkhand – are home to almost half of India's population along with the majority of its agricultural produce.

- There is also a **lack of interest in maintaining India's traditional water harvesting structures.**

Measures needed:

- **Structural measures:**

- Putting in place an efficient piped supply system (without leakage of pipes) has to be top on the agenda.
- Ancient India had well-managed wells and canal systems. Indigenous water harvesting systems need to be revived and protected at the local level. Examples: Karez, Bawli, Vav etc
- Digging of rainwater harvesting pits must be made mandatory for all types of buildings, both in urban and rural areas.
- **Treating the Greywater and reusing it** needs to be adopted by countries like Israel (upto 85%). It could be used to recharge depleted aquifers and use on crops.
- Initiatives such as **community water storage and decentralized treatment facilities, including elevated water towers or reservoirs and water ATMs**, based on a realistic understanding of the costs involved, can help support the city's water distribution.
- Technologies capable of converting non-drinkable water into fresh, consumable water, offering a potential solution to the impending water crisis are needed.
Example: **Desalination technologies in Coastal areas, Water-sterilization in polluted water areas.**

- **Non-structural measures:**

- The **World Bank's Water Scarce Cities Initiative** seeks to promote an integrated approach, aims at managing water resources and service delivery in water-scarce cities as the basis for building climate change resilience.
- Groundwater extraction patterns need to be better understood through robust data collection
- Decentralisation of irrigation commands, offering higher financial flows to well-performing States through a **National Irrigation Management Fund**.
- **Public awareness campaigns, tax incentives for water conservation and the use of technology interfaces** can also go a long way in addressing the water problem. **Example**, measures such as water credits can be introduced with tax benefits as incentives for efficient use and recycling of water.
- A collaborative approach like the adoption of a public-private partnership model for water projects can help. **Example**, in Netherlands, water companies are incorporated as

private companies, with the local and national governments being majority shareholders.

- Sustained measures should be taken to prevent pollution of water bodies and contamination of groundwater.
- Ensuring proper treatment of domestic and industrial waste water is also essential.

Conclusion:

Primarily water is not valued in India. “People think it is free”. In order to meet the future urban water challenges, there needs to be a shift in the way we manage urban water systems. An **Integrated Urban Water Management approach** must be adopted which involves managing freshwater, wastewater, and storm water, using an urban area as the unit of management.

The recently released IPCC report has inferred that reduction in global heating would require transformation of food production and land management, in the light of the above statement discuss the interlinkages of climate change and land management and recommend what needs to be done. (250 words)

[Indianexpress](#)

Why this question:

The article discusses the findings of the recently released IPCC report and its inference.

Demand of the question:

The answer must discuss the interlinkages of climate change and land management and recommend what needs to be done.

Directive word:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction

In brief quote the key highlights of the IPCC report.

Body

Intergovernmental Panel on Climate Change special report on climate change and land, released in Geneva on Thursday, found limiting global heating to below 2 degree Celsius can only be achieved by reducing emissions from all sectors – including land and food.

It finds the climate crisis is affecting all aspects of food security – including availability, price and nutrition – but that coordinated action to cut global emissions could simultaneously improve land resources, food security and nutrition and help to address hunger.

Discuss the aspect of land; Land use has always been part of conversations on climate change and activities like afforestation have held an important place in the fight against global warming.

Suggest solutions as what needs to be done.

Conclusion

Conclude with significance of the findings and need for urgent action.

Introduction:

The **Intergovernmental Panel on Climate Change’s (IPCC) report** on ‘**Climate Change and Land**’ reveals the relation between climate change and land use pattern. It presents the most recent evidence on how

the different uses of land like forests, agriculture, and urbanization are affecting and getting affected by climate change.

Body:

Key findings of report:

- The report talks about the contribution of land-related activities to global warming.
- It also talks about the manner in which even existential activities like food production contributes to global warming and is also affected by it.
- If pre-production and post-production activities are taken into account, food production could contribute as much as 37% of all greenhouse gas emissions (GHG) every year.
- It points out that nearly 25% of all food produced is either lost or wasted. And even the decomposition of the waste releases emissions.

Linkage between land use and climate change:

- Land use, and changes in land use, has always been an integral part of the conversation on climate change.
- That is because land acts as both the **source as well as a sink of carbon**.
- Activities like agriculture, cattle rearing, etc are a major source of methane and nitrous oxide, which are more dangerous than CO₂.
- Soil, trees, plantations and forests absorb CO₂ for photosynthesis, thus reducing the overall CO₂ content in the atmosphere.
- This is the reason why large-scale land use changes like deforestation, urbanisation or change in cropping pattern, have a direct impact on the overall emissions of greenhouse gases.

Impact on Food security:

- Climate change is affecting food security through increasing temperatures, changing precipitation patterns, and greater frequency of some extreme events.
- Agricultural Production: Increasing temperatures are affecting agricultural productivity in higher latitudes, raising yields of some crops (maize, cotton, wheat, sugar beets), while yields of others (maize, wheat, barley) are declining in lower-latitude regions.
- Nutritional Quality: Increased atmospheric CO₂ levels can lower the nutritional quality of crops.
- Livestock Production: Future climate change could affect livestock production.
- An increase in desertification and heatwaves could have a direct impact on animal morbidity, mortality and distress that in turn could adversely affect the food security.

- Higher Prices: Report states that cereal prices could increase by 1-29% by 2050 as a result of climate change, leading to higher food prices and increased risk of food insecurity and hunger

Measures needed:

- The measures include a major re-evaluation of land use including agricultural practices.
- Increasing land productivity, wasting less food, changing dietary habits of people from cattle meat to other types of meat.
- The report notes that, if proper changes to the land use pattern in agriculture and animal is implemented, 2.3 to 9 billion tonnes of CO2 equivalent can be avoided by 2050.
- Also with changes to the people's dietary habits CO2 equivalent of 8 billion tonnes can be avoided by 2050.

Conclusion:

India's action plan on climate change gives due recognition to the above fact. It has a very important component of forests. Under INDCs, India has pledged to create an additional carbon sink of about 2.5 billion to 3 billion tonnes by the year 2032 by increasing its forest cover and planting more trees.

"Large parts of India have been facing calamitous floods, the frequency of such disasters has been on the rise. How disastrous they prove, however, would depend on how prepared we are." Critically analyse in the light of recent incidents. (250 words)

[livemint](#)

Why this question:

The article paints a dismal picture of the flood conditions facing the country and the reasons underlying for their impact.

Demand of the question:

The answer must discuss in detail the need and necessity of disaster preparedness and how this aspect alone has much to decide on the nature of disaster and its impact.

Directive word:

***Critically analyze** – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.*

Structure of the answer:

Introduction

Brief about the recent flood situation in the country.

Body

Point out to the causes of the occurrence of the disasters; explain in what way the impact of the floods has been huge and impulsive owing to lack of preparedness.

Discuss that How well a country mobilizes resources to tackle disasters, natural or otherwise, is a sign of how advanced it really is. India has made progress, but our efforts need to be stepped up.

Quote case studies, discuss examples where preparedness for disasters have proved to be a solution.

Conclusion

Conclude with way forward.

Introduction:

In an unnerving reminder of last year's devastating floods, **Kerala's** worst in about 100 years, incessant precipitation has deluged many districts, causing havoc, snapping communication lines and claiming several lives. Rains have battered **Karnataka and Maharashtra**, too, leaving many dead and several missing. Meanwhile, dramatic visuals from **Madhya Pradesh, Rajasthan and Gujarat** have revealed widespread distress. Parts of **Bihar and Assam** are also reeling under torrential rainfall, with a large number of people left battling grim circumstances.

Body:

Factors causing floods:

- **More than average rainfall:**
 - India's western coast has received above-average rainfall on account of sustained low-pressure conditions.
- **Land use:**
 - Injudicious use of land is responsible for making states more prone to floods and landslides.
 - However, other factors such as a change in land use patterns and climate change could have contributed to the situation on the ground.
- **Deforestation:**
 - Unfettered development activity had increased the chances of landslides, a major cause of casualties during the floods.
- **Wetlands** have been lost to development projects, construction of roads, and buildings at places too close to rivers.
- Other issues mentioned such as **encroachment and unplanned construction** are self-evident priorities when development is viewed using the lens of climate-resilient water management (CRWM).
- **Mismanagement of dams:**
 - For dams to truly tame floods, experts say dam reservoirs need to be relatively empty before the onset of rain. This was not the case in many states.
 - Local officials have been blamed for exacerbating the situation by failing to gradually open the dams dotting the state's complex river network, waiting instead until they were already full before unleashing the excess water.
 - More flooding was caused by emergency releases from dams that were full. Despite forecasts of more rain, there were no controlled releases.

- **World Bank analysis** while preparing the National Hydrology Project (NHP) in 2015 showed that although weather forecasts are more accurate now, dam managers (especially bureaucrats) are reluctant to authorise advance controlled releases.
- **Roads, railway lines and housing colonies** being laid and built without regard for natural water ways, but with formal planning permission.
- The State Department of Inland Waterways focuses on large waterways while district and local panchayats have no mandate or interest in maintaining these to reduce flood risk.
- The State Disaster Management Agency also ignores them.
- Despite India being a signatory to the UN's Sendai Framework for Disaster Risk Reduction, little has changed on the ground.
- Most modern cities have elaborate flood management plans .But India cannot even protect known flood-plains, tank foreshores and lakes peripheries from encroachment and illegal construction.

Current Flood management programmes in India:

- **Flood Management Programme (FMP)** during XII Plan for providing central assistance to States to the extent of Rs. 10,000 crore for taking up works related to river management, flood control, anti-erosion, drainage development, flood proofing works, restoration of damaged flood management works, anti-sea erosion and catchment area treatment.
- **Flood forecasting** has been recognized as one of the most important, reliable and cost-effective non-structural measures for flood management. Recognizing the crucial role it can play, Central Water Commission, Ministry of Water Resources has set up a network of forecasting stations covering all important flood prone interstate rivers.
- **Flood Management and Border Areas Programme (FMBAP):** The aim of the Scheme is to assist the State Governments to provide reasonable degree of protection against floods in critical areas by adopting optimum combination of structural and non-structural measures and enhancing capabilities of State/ Central Government officials in related fields.
- **Deploying relief and rescue operations like National Disaster Response Force, State Disaster Response Force and Seema Sashastra Bal** to mitigate the disaster caused by floods.

Measures needed:

- **Jal Shakti ministry** needs to boost water storage and attendant catchment area flood management works not just nationally but beyond the nation's borders as well. Due to **technological upgradation** the meteorology experts have of late been predicting monsoon and other weather conditions with near perfection.
- Efforts made by the Centre and the state governments to check deforestation should be intensified. The tree plantation drives at all levels are steps in the right direction.

- Cleaning of drains and rivulets near the cities should be accorded top priority.
- Construction of embankments, flood walls, ring bunds, flood control reservoirs should be scientifically carried on.
- Improvement of river channels and surface drainage and most importantly checking erosion of land on river banks are other measures that could help checking the spread of flood.
- Advance town planning and yearly preparations should be done to mitigate the effects of urban planning.
- Flood control as a subject has no clear-cut legislative marking. As a subject it is not included in any of the legislative lists of the country that is the Union, the State or the Concurrent lists.
- **River-basin specific flood inundation modelling** with climate change simulations is a necessary first step to understand the full impact of potential unprecedented flooding. This includes worst-case scenarios such as twice the maximum historical rainfall, as was recently done by a Department for International Development, U.K.-supported project for the Mahanadi in Chhattisgarh.
- The **local community to co-manage water resources** with the government (by planning intermediate storage, drainage and emergency responses).
- There must be **massive awareness generation**, to ensure that buildings are not extended into river floodplains, that road culverts let storm water through without hindrance, and that excess water is not blocked but allowed to saturate the soil strata so that it does not cause mudslides
- Need to **use the best-available information for decision-making**. This means improved hydromet systems and weather forecasts, robust modelling of catchment water flows with simulations of different climate-related scenarios, international norms for safety factors and building codes.
- Flood control can be made effective through an **Integrated Dam Management System**, which is totally computerised and automated, the only exception being lifting and lowering of shutters which has to be done manually.

Conclusion:

Given the perils upon us, India has little option but to pay special attention to its institutional capacity for disaster mitigation and relief, the nodal agencies for which need to be kept well-funded. How well a country mobilizes resources to tackle disasters, natural or otherwise, is a sign of how advanced it really is. India has made progress, but our efforts need to be stepped up.

The Jal Jeevan Mission will be a major step towards improving our people's ease of living and meeting their aspirations of a New India. Analyse.(250 words)

[Indianexpress](#)

Why this question:

On August 15, during the first Independence Day speech of his second tenure, Prime Minister Narendra Modi announced the Jal Jeevan Mission, which plans to supply water to all households by 2024.

Key demand of the question:

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Brief on the concept of Jal Jeevan Mission.

Body:

Discuss the key features of the Jal Jeevan Mission

Mission Objective: To ensure Har Ghar Jal (piped water supply) to all rural households by 2024 under the Jal Jeevan Mission.

Executing agency: Department of Drinking Water and Sanitation under the Jal Shakti Mantralaya.

Strategy: This Mission will focus on integrated demand and supply side management of water at the local level, including creation of local infrastructure for source sustainability like rainwater harvesting, groundwater recharge and management of household wastewater for reuse in agriculture.

The Mission will converge with other Central and State Government Schemes to achieve its objectives of sustainable water supply management across the country.

Conclusion:

Conclude with in what way Jal Jeevan Mission will be a major step towards improving ease of living and meeting aspirations of a New India.

Introduction:

The Prime Minister in the Independence Day speech announced the **Jal Jeevan Mission**, which plans to **supply water to all households by 2024**. It will be a **decentralised, community-managed and sustainable water management scheme**.

Body:

Objectives:

- This Mission will focus on **integrated demand and supply side management of water at the local level**, including **creation of local infrastructure** for source sustainability like rainwater harvesting, groundwater recharge and management of household wastewater for reuse in agriculture.
- The Mission will **converge with other Central and State Government Schemes** to achieve its objectives of sustainable water supply management across the country.

Current Scenario of water supply in rural areas:

- For many years, the central and state governments have been making efforts to increase access to safe and adequate drinking water.
- The provision of a basic quantity of drinking water in rural India has been achieved through hand pumps, dug wells, household water supply (HWS), etc.
- Thus, while states like Sikkim managed to achieve high levels of HWS, a relatively low percentage of rural Indian households have access to this.

Challenges faced:

- In rural drinking water service delivery, there is inadequate attention given to taking measures to sustain the source of the water, in most cases groundwater is a challenge.
- This proposed mission will make source sustainability measures mandatory prior to pumping and distributing water to households.
- Another issue with the traditional approach to service delivery was that the provision of drinking water was viewed primarily as an engineering solution, with schemes being planned and executed by the public health and engineering departments.
- However, water is an ideal sector for the applicability of the principle of subsidiarity, performing only those tasks which cannot be performed effectively at a more immediate or local level.

Jal Jeevan mission – a solution:

- With adequate capacity building and training, water can be most efficiently managed at the lowest appropriate level.
- Adopting this principle, the Jal Jeevan Mission's first preference will be to have **community-managed single village ground water-based schemes**, wherever sufficient quantity and good quality of groundwater exists.
- Wherever adequate quantity of safe groundwater is not present, or where it may be technically not feasible to have **single-village schemes**, **surface water-based multi-village schemes** will be promoted.

- Further, in some remote regions, where it may not be techno-economically feasible to have **household water supply schemes, local innovations, such as solar-based schemes** will be encouraged.
- It is not commonly known that household waste water from HWS amounts to about 75% of the amount of water supplied.
- With the rural households to get HWS under the proposed mission, huge quantities of household waste water will be generated across the country, therefore making its effective management critical.
- There is a plan to include a mandatory provision under the mission for the effective channelling and treatment of household waste water, through appropriate and low cost drainage and treatment systems.
- Once appropriately treated, this waste water can be used for both recharge of groundwater as well as for irrigation purposes.

Way forward:

- An **extensive information, education and communication** will be needed to create a people's movement for water management.
- The **ongoing Jal Shakti Abhiyan** will help in creating awareness about the importance of integrating source sustainability and water reuse.
- This **integrated approach to decentralised, community managed, and sustainable water** management is the backbone of the government's plan to ensure that every household gets the benefits of water supply.

Conclusion:

The Jal Jeevan Mission will be a major step towards improving our people's ease of living and meeting their aspirations of a New India.

India has reached a long way in reducing plastic waste but a lot more needs to be done yet.
Elucidate.(250 words)

[Downtoearth](#)

Why this question:

In response to Prime Minister's call on India's 73rd Independence day, to make India free of single use plastics, a massive public campaign will be launched engaging all stakeholders.

Key demand of the question:

The answer must evaluate the need for reducing plastic waste in the country.

Directive:

***Elucidate** – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.*

Structure of the answer:

Introduction:

State few facts depicting plastic pollution scenario in the country.

Body:

Discussion should include the following:

Explain first the past and present India's efforts to beat plastic pollution.

How far has the country gone?

Discuss why the steps aren't alone enough to tackle the menace and what more needs to be done.

Conclusion:

Conclude with way forward.

Introduction:

The Prime Minister delivering his 2019 Independence Day speech at Red Fort, pitched for freedom for India from single-use plastic. This was the incumbent government's second strong position against single-use plastic. The then Union minister for environment, forest and climate change, said on World Environment Day 2018 (June 5) that the country would try to "phase out" single-use plastic by 2022.

Body:

India's efforts towards reducing plastic waste:

- The **Plastic Waste Management (PWM) Rules 2011**, introduced under the Environment Protection Act, 1986, established a framework that assigned responsibilities for plastic waste management to the urban local body (ULB) and set up a state level monitoring committee.
- The 2011 rules were succeeded by the **PWM Rules 2016**, which tightened the rules (for example, banning plastic bags of less than 50 microns thickness), and also lay the foundation for accountability across the value-chain.
- The new rules **require producers and brand-owners to devise a plan** in consultation with the **local bodies to introduce a collect-back system**.
- The **extended producers' responsibility (EPR)** would assist the municipalities in tackling the plastic waste issue.
- The rules also state that the manufacture and use of multi-layered plastics that are hard to recycle must be phased out.
- Under the Good and Service Tax (GST), plastic waste was put under a 5 per cent bracket, hurting the informal sector, which already lacks a concrete action plan.
- **Latest amendments to plastic management rules 2016:**
 - Rule 15 (Explicit pricing of carrying bags) has been omitted in the amendment. It earlier required every vendor, who sold commodities in a carry bag, to register with their respective urban local body and pay a minimum fee of Rs 48,000 annum (4000/month) after the announcement of the bye-laws.
 - Other minor amendments include the addition of two more definitions: one on 'alternate use' and one on 'energy recovery'.

- The section 13 (2) now requires all brand owners and producers to register or renew registration with the concerned State Pollution Control Board (SPCB) or Pollution Control Committee if operational only in one or two states or union territories.
- They have to do the same with the Central Pollution Control Board (CPCB), if the producers/brand owners are operating in more than two states or union territories.
- Some states like Telangana, Maharashtra, Tamil Nadu, and Himachal Pradesh banned plastic bottles and Tetra packs, single-use straws, plastic/Styrofoam tea cups/containers, etc. But many like Bihar banned only polythene bags.
- The most detrimental single-use plastics are multi-layered sachets for packing products like tobacco. The Plastic Management Waste 2016 rules prohibit their use for storing and selling gutka / tobacco and paan Masala.

Shortcomings in the efforts:

- There is **no central and comprehensive definition for single-use plastic**, crucial for any ban to be successful. Governments currently use various definitions.
- The Plastic Management Waste 2016 rules are hardly enforced. Implementation of the rules has been poor in all aspects and the amendment says nothing to strengthen it.
- Packaging for snacks like chips and fries, chocolates, beverages, etc are equally harmful. These ubiquitous packages are not recycled.
- Section 9 (3) of the latest amendment to plastic management rules 2016 gives plastic producers a scope to argue that their products can be put to some other use, if not recycled.
- This move tantamount to revoking a complete ban, which it had implied earlier.
- This type of plastic was supposed to be banned by March 2018, but it is nowhere near a phase-out.
- The idea of extended producer responsibility (EPR), which was introduced in the rules of 2016, still remains nowhere close to being implemented even after two years.
- EPR targets have to be accounted for at the national level, irrespective of which state the products are sold or consumed in. The amendment does not address these issues. Moreover, no example of deposit refund scheme system has been implemented in any state.
- Lack of adequate infrastructure for segregation and collection is the key reason for inefficient plastic waste disposal.
- Most municipal corporations still do not have a proper system of collection and segregation, given their lack of access to technology and infrastructure, which are needed to dispose of plastic waste in a cost- and resource-efficient way.

- The Solid Waste Management Rules, 2016, mandate ULBs to set up facilities for processing sorted dry waste. However, the implementation has been rather bleak, owing to available land/space concerns.
- Source separation of waste, coupled with segregated collection and transportation, has been weak links in the waste supply.
- Imposing penalties or fines is easier said than done in a democratic setup.
- Plastic in oceans and forests are choking flora and fauna. In fact, plastic trash is expected to exceed the fish population in 2050.
- Microplastics has ability to enter food chain with the highest concentration of the pollutants

Way forward:

- ULBs could take a cue from cities like Bangalore where dry waste collection centres have not only been established but also have a self-sustainable business model.
- Municipalities must develop waste collection plans, coupled with outreach activities, to sensitise citizens on waste segregation.
- It is imperative to develop a phase-wise implementation of the EPR programme with yearly targets and a system of nationwide offsets and credit to ensure effective implementation of the rules.
- **International best practices:**
 - The success of imposing a plastic bag fee has also been established in cities like Chicago and Washington, showing that such interventions could be effective in shaping behaviour change.
 - The European Union is mulling new laws to ban some everyday single-use plastic products including straws, cutlery and plates citing plastic litter in oceans as the concern prompting the action.
 - **Encouraging plogging:** Picking up litter while jogging or strolling was kick-started on a small scale in a small part of Stockholm about a year ago, it has spread across the globe and India can adopt this as well.
 - Countries such as the U.S., Canada and the Netherlands have already put in place regulations to stop the use of microbeads in personal-care products. The sooner India adopts such regulations, the better
- Recycling has to ensure that wastes are converted into products of the same quality, if not better, compared to the original product.
- **Stop using single use plastic:**

- The Government of the state of Maharashtra has announced an ambitious ban of plastic bags, water bottles and other disposable plastic items in the state after the state civic bodies started facing serious problems on garbage disposing and its management.
- Fine for violating the ban will be Rs 5,000 for the first offence, Rs 10,000 for the second and Rs 25,000 for the third offence or a three-month jail term or both.
- With a worldwide crisis due to plastic waste, India has to involve all the stakeholders take the responsibility of ensuring minimisation, reuse and recycling of plastic to the maximum.
- Sensitise people to stop littering and segregate their waste. Nowadays the most popular eco-conscious effort is participating in beach cleanups.
- Sanitary napkins made from biodegradable material, menstrual cups should be promoted.

Indian Monsoon's increasing unpredictability calls for greater efficiency in rainwater storage and use. Do you agree? Elucidate with suitable justifications. (250 words)

Indianexpress

Why this question:

The article discusses the urgency of focusing on storage and use of rainwater efficiently to address the water crisis facing the country.

Key demand of the question:

The answer must relate the unpredictability of the Indian monsoon and relevance of rainwater storage and use.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Describe the recent unpredictable nature of Indian Monsoons.

Body:

The answer must explain the issue of Indian monsoon – fewer rainy days and more extreme precipitation, explain its impact on agriculture etc.

Discuss the monsoonal vagaries and how it has impacted the Indian economy and life.

Take hints from the article and debate over and form a balanced opinion and justify with examples the urgent need to press on storage and harvest of rainwater.

Conclusion:

Conclude with importance of conserving water.

Introduction:

It is said that “agriculture is the backbone of Indian economy.” To an agriculturist, water is more valuable. In many ways, the monsoon is the lifeblood of India's farm-dependent economy. The Monsoon's increasing unpredictability calls for greater efficiency in rainwater storage and use.

Body:

Unpredictability of Monsoon in India:

- In **June**, rainfall was **8 per cent deficient on an average** across India and the prospect of a monsoon failure loomed large.
- And with the dry spell extending from September in many parts, the return of food inflation, it seemed, would present the re-elected government with its first big challenge.
- But in **July**, the rains turned out **6 per cent more than the average**.
- In this month, till August 17, they have been a **whopping 34.9 per cent above normal**.
- As a result, cumulative rainfall for the southwest monsoon season (June-September), which was **almost one-third deficit till June-end**, has now become **9 per cent surplus**.
- Such a dramatic turnaround is, perhaps, unprecedented.
- The current revival has also helped substantially close the gap in kharif crop plantings: Till July 5, the total area sown by farmers was 26.7 per cent lower than last year's corresponding coverage.
- That has since narrowed to just 5.3 per cent, which should considerably assuage food inflation fears.

The monsoon's increasing unpredictability, with fewer rainy days and more extreme precipitation. For the farmer, this is a nightmare. When the rains don't come on time, pour when they do, or take extended breaks, it disrupts the entire cropping cycle from the sowing, vegetative and reproductive growth stage right up to harvesting. Agriculture is a gamble in the best of times; but now it becomes a game of pure chance embodying risk as well as uncertainty. And blaming it all on climate change is hardly helpful.

Rainwater harvest and storage – a potential solution:

- India has some 107 major reservoirs with over 166 billion cubic meters' active storage capacity.
- A time-bound programme for lining of irrigation channels — or even better, replacing all open canals with pressurised HDPE/PVC piped distribution networks — will enable the water filled in these dams during the monsoon to be used for a longer period.
- The same water can be further conveyed to farmers' fields through drip/sprinkler irrigation.
- Harvesting of rainwater, whether in large reservoirs or farm ponds, and which can take place any time during the monsoon season, will give farmers greater flexibility in their cropping operations.

Challenges in the above approach:

- **Dam safety issues:** Most dams are old and pose grave threat to the people living downstream.
- **Evaporation:** India has more than 300 sunny days and reservoir storage can lead to evaporation.
- **Issues with states:** The storage of water in reservoirs in one state can lead to shortage of water in other states leading to tussle between states.

- **Lack of education:** Huge storage levels could lead to reckless usage of water

Thus, only water storage is not the panacea. There is need for other measures too:

- In rainfed areas, **water security** primarily depends upon rainwater harvesting and the efficient use of the available water through techniques like drip irrigation, and the appropriate choice of farming systems.
- **Groundwater augmentation and management** is an important method of ensuring adequate and timely availability of water for crops. Fortunately, the concept of 'more crop per drop' is being promoted by the government.
- The government must resolve to address the structural issues and there is a need to give farmers not just a better, but also more stable, return on their crops.
- The monsoon-dependent Indian economy needs **climate-sensitive budgeting**.
- The excessive dependence on monsoon may be mitigated by the construction of modern irrigation canals, afforestation, and diversification of Indian industries.
- Farmers, especially smallholder farmers, need advance warning of emergent weather conditions at a local level.
- Develop **climate-smart agriculture practices**.
- Build adaptive capacities to climate variability and strengthen the sustainability of farming systems.
- Preventive measures for drought that include growing of pulses and oilseeds instead of rice.
- **Mobile telecommunication systems** are increasingly cost-effective and an efficient way of delivering weather-based agro-advisories to farmers at a large scale.
- **Allied agricultural practices like Agroforestry, Apiary, Fisheries, Animal husbandry** should be promoted which can act as economic alternative in times of Monsoon failure.

In the recent times Microplastics evidently have compelling populace to look at plastics in a different way. Critically examine.(250 words)

[Indianexpress](#)

Why this question:

The question is based on the theme of microplastics.

Key demand of the question:

The answer must capture in what way the menace of microplastics has alarmed the people across the world and compelled to rethink over the use of plastics.

Directive:

Critically examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with definition of what are microplastics.

Body:

Discussion should include the following:

Microplastics, which are defined as shreds of plastic less than 5 mm in length.

A study published in June estimated that the average human ends up consuming at least 50,000 particles of microplastics in food every year.

Quote facts similar to the above to justify the urgency to acknowledge the menace posed by the microplastics.

Explain in what way the use of microplastics can disrupt life.

Discuss what needs to be done to tackle the problem.

Conclusion:

Conclude with way solutions to address the issues.

Introduction:

Microplastics are small plastic particles in the environment that are **generally smaller than 1mm down to the micrometer range**. The researchers found huge amounts of them in the Arctic snow; their study claims to be the first that contains data on contamination of snow by microplastics.

Body:

Microfibres from washing of textiles, microbeads used in cosmetics and even paint from land run-offs can dump microplastics in the ocean. Plastic bottles, bags, fishing nets, and food packaging are some examples of the larger pieces that break down into microplastics, eventually finding their way into the soil, water and the air we breathe. According to a **2017 International Union for Conservation of Nature (IUCN) report**, microplastics are estimated to constitute up to **30% of marine litter polluting the oceans**.

Concerns posed by Microplastics:

- Microplastics escape the filtration and treatment processes for waste water and end up in sites of nature.
- This is resulting in significant global impacts on wildlife from marine environment pollution.
- Microplastics are killing the fish before they reach reproductive age, stunted growth and altering the behaviour in some fishes.
- Microplastics are found in the viscera of dead sea birds, reptiles like turtles, whales etc.
- World's coastal countries currently do not have the concerned recycling policies or the technical capabilities, and so large quantities of plastic are not recycled and enter landfill.
- The durable properties of plastics make them persistent and slow to degrade in the environment entering the food chains.
- It holds the potential for both bioaccumulation and biomagnification.
- Once the microplastics enter foodchain, they carry synthetic chemical compounds such as PCBs and PAHs, which are carcinogenic.

- Unlike POPs (Persistent Organic Pollutants) or chlorofluorocarbons (CFCs), Plastic pollution has received little attention in terms of international agreements.
- **Microplastics make up 94 percent** of an estimated 1.8 trillion pieces of plastic in the patch. But that only amounts to eight percent of the total tonnage

Measures needed:

- Local actions are required for mitigating plastic pollution, using mechanisms such as bans on plastic bags, maximum daily limits for emissions into watersheds, and incentives for fishing gear retrieval.
- Microbeads in cosmetics, daily use items must be banned globally.
- Countries should come together to establish measurable reduction targets for plastic waste. A meaningful international agreement—one with clearly defined waste reduction targets is the need of the hour.
- Effective policies must take into account all stages of the lifecycle of plastic—connecting producers to users and ultimately to waste managers.
- Nonprofits like 5 Gyres are now pushing an agenda toward public awareness, corporate responsibility and the idea of a circular economy — an economy that focuses on keeping waste to a minimum while maximizing materials' use.
- Fossil fuel subsidies incentivise the plastic market. Hence, Countries should end fossil fuel subsidies. Annually, 4–8% of oil is used to produce raw plastic.
- India has a major problem dealing with plastics, particularly single-use shopping bags that reach dumping sites, rivers and wetlands along with other waste.
- The most efficient way to deal with the pollution is to control the production and distribution of plastics.
- Banning single-use bags and making consumers pay a significant amount for the more durable ones is a feasible solution.
- Enforcing segregation of waste will retrieve materials and greatly reduce the burden on the environment.
- Waste separation can be achieved in partnership with the community, and presents a major employment opportunity.
- Eco-friendly substitutes (cloth/paper/jute bags, leaves/areca leaf plates, paper straws) should be developed. For this, scientific and financial support (soft loans and subsidies) is required.

Conclusion:

Marine plastic pollution is a “planetary crisis,” and we should hope for a “Paris-style” global treaty aimed at tackling it. We cannot transform our world into a ‘plastic planet’. What is needed is collective public effort to stop plastic pollution and safeguard our ecosystem/biodiversity.

Man-made fires in the Amazon rainforest have sent smoke to populated cities and the Atlantic coast. Why does it bring focus on President Bolsonaro’s policies? What impact can it have on the environment? Critically analyse. (250 words)

Indianexpress

Why this question:

The question is in the context of recent forest fires witnessed by the Amazon forests.

Key demand of the question:

The answer must evaluate the underlying causes for the forest fires and the impact it can have on the environment.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

First explain in short what are forest fires.

Body:

The article best explains the causes owing to which the Amazon forests are facing forest fires. One must explain the significance that these rainforests hold for the health of the world environment.

Explain the recent policies of the President Bolsonaro that have led to such alarming conditions that may become irreversible if policies are not put in place to conserve the forests.

Explain what needs to be done

Conclusion:

Conclude with way ahead.

Introduction:

The Amazon rainforest, covering much of northwestern Brazil and extending into Colombia, Peru and other South American countries, is the world’s largest tropical rainforest, famed for its biodiversity. The Amazon rainforests also called the ‘lungs of the earth’ account for **10% of the world’s terrestrial primary productivity** and serves as a **major carbon sink for nearly 20% of the total emissions**. Climate change, largely induced by increasing anthropogenic activity is instrumental in the rapid degradation of these forests.

Body:

Effects of Policies:

- Over the last several days, the Amazon rainforest has been burning at a rate that has alarmed environmentalists and governments worldwide.
- Mostly caused by farmers clearing land, the fires have thrown the spotlight on Brazil President Jair Bolsonaro’s policies and anti-environment stance.

- The environmentalists are blaming Brazilian President Jair Bolsonaro for the forest fires.
- When Bolsonaro was running for president, he had promised to restore Brazil's economy by exploring the economic potential of the Amazon rainforest.
- As per environmentalists, Bolsonaro has encouraged the farmers and ranchers to exploit and burn the rainforest like never before.
- According to the data from Brazil's National Institute for Space Research (INPE), the Amazon Forests in Brazil has experienced **74,155 fires since January 2019**.
- Amazon deforestation began in earnest in the 1970s, reaching its peak rate at the end of the 1990s and the start of the 2000s.
- In 2004, about 28,000 square km of forest had been cleared in Brazil alone (the Amazon spreads over nine countries, but 60 per cent of the rainforest is in Brazil).
- The thousands of fires burning in the Amazon don't look like the major forest fires of Europe or North America — instead, they are fuelled mainly by branches, vegetation and other by-products of deforestation in cleared areas.

Impact on Environment:

- The Amazon rainforest is a repository of rich biodiversity and produces approximately 20% of oxygen in the Earth's atmosphere.
- It is home to many indigenous communities, their life depends on the forests.
- Additional Carbon Emissions: Carbon intake by the Amazon basin matches the emissions released by nations in the basin. The burning of forests, therefore, implies additional carbon emissions.
- Further deforestation could lead to Amazon's transformation from the world's largest rainforest to a savannah, which would reverse the region's ecology.
- Savannah is a vegetation type that grows under hot, seasonally dry climatic conditions and is characterized by an open tree canopy (i.e., scattered trees) above a continuous tall grass understory (the vegetation layer between the forest canopy and the ground).
- The largest areas of savannah are found in Africa, South America, Australia, India, Myanmar (Burma)–Thailand region in Asia, and Madagascar.
- Impact on Water Cycle: Amazon rainforest has the ability to produce at least half of the rain it receives. The rain produced by the Amazon travels through the region and even reaches the Andes mountain range.

Measures needed:

- Reduce the use of wood and wood by-products in daily life to save trees and earth

- The government in the concerned countries should take measures to stop slash and burn agriculture
- Forest fires can be reduced if farmers reduce the burning of stubble in the area

Conclusion:

Amazon rainforests are unique and irreplaceable units. Its destruction is worrisome because it affects the lifeblood for entire Amazon region, we all should strive for protecting the rainforests in our best capability.

Beyond health costs, air pollution can also hurt the economy in other ways. Elucidate in the backdrop of alarming air pollution issue in the country.(250 words)

Livemint

Why this question:

The article provides for a detailed coverage of the ongoing air pollution crisis the country is witnessing.

Key demand of the question:

One must elaborate as to how the problem of pollution no more is only about the health but is also about the cost it bears on the economy in multiple other ways.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In short define air pollution, explain with facts how it affects in multiple fronts.

Body:

Explain that Beyond health costs, air pollution can also hurt the economy in other ways. In a 2018 study, Jamie Hansen-Lewis of Brown University finds that air pollution hurts productivity in India's labor-intensive industries.

It estimates that bringing the country's air to global standards would lead to a small increase in profits of 0.3% across manufacturing companies with more pronounced effects in labor-intensive firms.

Similarly, pollution is also hurting agriculture by stifling crop productivity. One 2014 study estimated that air pollutants were responsible for 19% of the loss in yields in wheat production in India in 2010.

Discuss that air pollution is also linked inextricably to climate change. Some of the same particles that clog up the lungs can clog up the atmosphere and contribute to the changing weather patterns.

Suggest solutions to tackle the problems.

Conclusion:

Conclude that India's air pollution policy needs to be more systematic and solutions need to be put in place with a multi-pronged approach.

Introduction:

According to WHO, of the 20 most polluted cities in the world, the top 14 are Indian cities. The problem of air pollution disrupts not only the NCR area but many other prominent urban areas like Allahabad and Ludhiana which figure above Delhi in the pollution ranking across the world. In India, air pollution is the third highest cause of death among all health risks, ranking just above smoking.

Body:

Impact of air pollution on the economy:

- Beyond health costs, air pollution can also hurt the economy in other ways.
- According to a report by the **United Nations Environment Programme (UNEP)**, India had the highest share of welfare costs (or a loss of income from labour), of about \$220 billion (about ₹1.4 trillion), in South and South-East Asia of a combined total of \$380 billion from mortality due to air pollution.
- In addition to human lives lost, there's an estimated global cost of \$225 billion in lost labour, and trillions in medical costs, Greenpeace report says.
- Government is keen to ascend the World Bank's "ease of doing business" chart, but images of people walking around Delhi in safety masks do little to attract investment.
- In a 2018 study, Jamie Hansen-Lewis of Brown University finds that air pollution **hurts productivity** in India's labour-intensive industries.
- She estimates that bringing the country's air to global standards would lead to a small increase in profits of 0.3% across manufacturing companies with more pronounced effects in labour-intensive firms. Similarly, pollution is also hurting agriculture by stifling crop productivity.
- A 2014 study estimated that air pollutants were responsible for 19% of the loss in yields in wheat production in India in 2010.

Government efforts in dealing with air pollution:

- The government acknowledged air pollution as a pan-India problem with the drafting of the **National Clean Air Programme (NCAP)**, which was intended to build and strengthen the institutional capacity to monitor air quality across India, carry out indigenous studies to understand the health impacts of air pollution and create a national emission inventory.
- Banning the use of private vehicles from November 1 onwards in Delhi, although drastic, will definitely not be enough to curb pollution.
- **Odd-even schemes** and, recently, the allowance by the Supreme Court (SC) for only green or zero-emission firecrackers, are the episodic measures that have been used, and still continue to be, to combat this methodical pollution.
- There have also been instances of **ban on construction activities**.
- States have got nearly Rs.650 crore to help farmers buy subsidised equipment such as **Happy Seeder, Paddy Straw Choppers and Zero Till Drill**.
- There is a **50% subsidy to farmers**, and a **75% waiver to cooperative societies, agencies** that rent out equipment, farmers' interest groups or gram panchayats to buy such machines.

Way forward:

- Short term measures should be accompanied by measures that **increase the forest cover** of the land and provide farmers with an alternative to burning the remains of their crops.
- An innovative approach could be to **use climate change funds to turn farm residues into a resource**, using technological options such as converting them into **biofuels** and **biofertilizers**.
- **Proactive engagements are necessary to persuade and reassure farmers.**
- It is important to find other uses for stubble such as biomass, which may encourage farmers to look for **alternative sources of income**.
- India should at least now give high importance to the **WHO warning about air pollution being the new tobacco**. Sharply escalated, deterrent parking fees can be implemented.
- From an urban development perspective, large cities should reorient their investments to **prioritise public transport, favouring electric mobility**.
- **Incentives** for adoption of **alternate mobility technologies** should be promoted.
- The **World Bank** has said it is keen to enhance its lending portfolio to tackle air pollution, opening a new avenue for this.
- Governments should make the **use of personal vehicles in cities less attractive** through **strict road pricing mechanisms** like **Congestion tax, Green-house Gas tax**
- Need to speed up the journey towards **LPG and solar-powered stoves**.
- **Addressing vehicular emissions** is within India's grasp but requires a multi-pronged approach. It needs to combine the already-proposed tighter emission norms (in form of BS VI), with a push for shared mobility and public transport and adoption of alternate mobility technologies.
- NCAP should take precedence from emerging practices in the country—**pollution cess in Delhi on truck entry, big diesel cars, and diesel fuel sales and the coal cess**—to generate dedicated funds to finance clean air action plan.
- **Tackle road dust** by **mechanised sweeping** and **water-sprinkling** but what would be more beneficial is if the sides of the roads could be paved or covered with grass that holds the soil together and stops the production of the dust in the first place.
- Attention to non-technological aspects such as **urban planning, to reduce driving, and to increase cycling, walking, and use of public transport** are needed.

In your opinion do you agree that grass-roots governance is the urgent call for safeguarding the bio-diversity of the Western Ghats region? Discuss.(250 words)

The hindu

Why this question:

The article highlights the significant arguments that were made by the Western Ghats Ecology Expert Panel (WGEEP) to preserve and conserve the ecology of the region.

Key demand of the question:

The answer must envisage upon the significance that grass root governance would hold in bringing in conservation and preservation of the ecology of the western Ghats to the forefront.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You must give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short explain the significance of western Ghats and its ecology in general.

Body:

Explain first the importance of democratic devolution.

Discuss the need for full advantage of powers and responsibilities conferred on citizens under provisions such as the 73rd and 74th Amendments to the Constitution, and the Biological Diversity Act, 2002.

Discuss the need to assert that conservation prescriptions should not be merely regulatory, but include positive incentives such as conservation service charges.

Explain that we must hand over economic activities like quarrying to agencies like the Kudumbashree groups that are accountable to local communities.

Conclude with significance of grass root empowerment.

Conclusion:

Conclude with significance of grass root empowerment.

Introduction:

In 2018, many people thought that the floods and landslides in Kerala that caused huge financial losses and manifold human tragedies marked a once-in-a-century calamity. But again, in 2019, a repeat of the **shocking trail of intense floods, landslides, financial losses and manifold human tragedies** has not just left the same set of people stunned but also made them realise that it is unwise to continue business as usual, and that we must think afresh of the options before us.

Body:

The Western Ghats is a **biological treasure trove** that is endangered, and it needs to be “**protected and regenerated, indeed celebrated for its enormous wealth of endemic species and natural beauty**”.

Democratic devolution and Western Ghats:

- **Decentralized water management plans** to be developed at least for the next 20 years. Water resource management plans with **suitable watershed measures, afforestation, eco-restoration of catchments, rainwater recharging and harvesting, recycling and reuse** should be built into the plans.
- **Basin level management plans:** These water management plans should integrate into basin level management plans. The objective is to **reduce the dependence on rivers and external sources** and **to improve recharge**.
- **Encourage use of organic manures:** Self-help groups/ local entrepreneurs should be supported to set up units for the manufacture of organic farming material such as **good quality organic manure, oil cakes, and bio-fertilizers** so that good quality manure can be assured on time and reduces ground water pollution

- **Agro-biodiversity conservation with local participation:** A **participatory plant breeding and crop improvement programme** needs to be launched at the Panchayat level with farmers, including women, to restore traditional varieties and develop good varieties suitable for each locality. **Conserving locally adaptive varieties** may also become extremely relevant in the context of climate change
- **Legislations:** **Joint Forest Management (JFM), Extension of Panchayat Raj to Scheduled Areas (PESA), Protection of Plant Variety and Farmers' Rights Act (PPVRFA), Biological Diversity Act (BDA) and the Scheduled Tribes and other Traditional Forest Dwellers (Rights over the Forest) Act (FRA)** have conferred substantial rights over natural resources to local communities and governments should devolve the powers as mentioned in these acts.
- **Environmental Impact Assessment:** For mining within the Western Ghats, cumulative EIAs must be made mandatory rather than entertaining EIAs for individual leases in the same areas.
- **Sustainable energy generation:** **Micro and mini hydel projects** in eco sensitive areas in the Ghats should be designed more to meet local power demand and not to feed to the grids as power lines are needed to evacuate power from these plants
- **Transportation:** All future proposals for railway lines and roads should undergo a thorough environmental and wildlife impact assessment. There should be a **subcommittee (comprising all relevant stakeholders and local communities and tribes)** to assess the environmental and ecological impacts of constructing any transport infrastructure through rich forests, wildlife habitats and wildlife corridors.

Way forward:

- It is necessary to use this vast experience and existing policies to formulate and implement appropriate policies, including transfer of financial powers, and institutions to promote sustainable and participatory forestry under the emerging programmes and mechanisms.
- We should assert that conservation prescriptions should not be merely regulatory, but include positive incentives such as conservation service charges.
- We must hand over economic activities like quarrying to agencies like the **Kudumbasree groups** that are accountable to local communities.
- We must take full advantage of powers and responsibilities conferred on citizens under provisions such as the 73rd and 74th Amendments to the Constitution, and the Biological Diversity Act, 2002.
- We, the sovereign people, are the real rulers of India and must engage ourselves more actively in the governance of the country and lead it on to a path of people-friendly and nature-friendly development.

Case study: **Kerala – A leader in devolution:**

- *Kerala leads the country in democratic devolution.*

- The Kerala High Court had ruled in favour of Plachimada Panchayat that cancelled Coca-Cola's licence because the company polluted and depleted groundwater reserves, drying up wells and adversely impacting agriculture and livelihoods.
- While doing so, the panchayat invoked its constitutional rights, arguing that it had the duty to protect the well-being of its citizens and had the right to cancel — or refuse permission for — anything that affected its citizens adversely.
- The company's counterargument was that the panchayat was subordinate to the State government, which had granted it the licence.
- The Kerala High Court rejected this contention, affirming that grass-roots institutions have the authority to decide on the course of development in their own locality.
- Furthermore, the Kerala legislature unanimously passed a law asking Coca-Cola to pay Plachimada Panchayat due compensation for losses inflicted on them.
- Kerala had also been at the forefront of the country's Literacy Mission of the late 1980s; it pioneered Panchayat Level Resource Mapping involving neo-literates and followed it up with the People's Planning campaign that attempted to involve every panchayat in the preparation of a Panchayat Development Report

Disaster and disaster management.

“River linking projects for the country are a great challenge and at the same time an opportunity to address the water issues arising out of climate change.” Critically analyse the statement in the light of recent floods witnessed across the country.(250 words)

Reference

The Big Picture- floods and river linking

Why this question:

The debate captures in depth analysis of river linking projects for India and in what way they are a boon and a bane at the same time.

Demand of the question:

The answer must analyse in detail the pros and cons of the river interlinking projects in the backdrop of recent floods witnessed across the country.

Directive word:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Start with key facts depicting the uneven distribution of rains across the country.

Body

The interlinking project aims to link India's rivers by a network of reservoirs and canals that will allow for their water capacities to be shared and redistributed.

According to some, this is an engineered panacea that will reduce persistent floods in some parts and water shortages in other parts besides facilitating the generation of hydroelectricity for an increasingly power-hungry country.

Discuss in brief the history of interlinking projects in India.

Then explain the positives of such a policy.

Discuss the demerits – financial viability, physical viability, will adversely affect land, forests, biodiversity, rivers and the livelihood of millions of people etc.

Discuss examples of successes and failures and suggest what should be done.

Conclusion

Conclude with a fair and balanced opinion.

Introduction:

The river interlinking project aims **to link India's rivers by a network of reservoirs and canals that will allow for their water capacities to be shared and redistributed.** Some experts claim that this is an **engineered panacea** that will **reduce persistent floods in some parts and water shortages in other parts** besides facilitating the generation of hydroelectricity for an increasingly power hungry country.

Body:

Opportunities arising out of River linking projects:

- India receives most of its rain during monsoon season from June to September, most of it falls in northern and eastern part of India, the amount of rainfall in southern and western part are comparatively low. It will be these places which will have shortage of water. Interlinking of rivers will help these areas to have water throughout the year.
- This will cut farmers dependence on monsoon rains by bringing millions of hectares of cultivatable land under irrigation.
- Crop productivity would increase and so would revenues for the State.
- Even one bad monsoon has a direct and debilitating economic impact.
- The river linking project will ease the water shortages in western and southern India while mitigating the impacts of recurrent floods in eastern India.
- The Ganga Basin, Brahmaputra basin sees floods almost every year. In order to avoid this, the water from these areas has to be diverted to other areas where there is scarcity of water. This can be achieved by linking the rivers. There is a two way advantage with this – floods will be controlled and scarcity of water will be reduced.
- Simultaneous floods and droughts continue to wreak havoc, destroying the lives and livelihoods of millions.
- India needs clean energy to fuel its development processes, and river water can be leveraged for this.
- Fulfilling water needs impact socio-economic life of people which will help end poverty.
- Need for interlinking of rivers to prevent inter-state water disputes.

- Potential benefits to transportation through navigation, as well as broadening income sources in rural areas through fishing.

Challenges posed:

- The idea that river linking would allow us to cope with flood in the north east and shortage of water in the Deccan is the positive aspect as pointed earlier but misleading one too.
- This floods come at the time when most parts of the country run short of water, we need to hold the water somewhere to use it in dry season but the amount of flowing in the short period of time in Brahmaputra and Ganga is so huge to store and use it later.
- **Variability in rainfall** is high which is the main source in the country, flood and drought simultaneously within the states of Bihar and Maharashtra.
- Irrigation potential from interlinking rivers will have limited impact. The net national irrigated area from big dams has decreased and India's irrigated area has gone up primarily due to groundwater.
- Interlinking of rivers is a **very expensive proposal**. The amount required for these projects is so huge that government will have to take loans from the foreign sources which would increase the burden on the government and country will fall in a debt trap.
- The river interlinking project will **adversely affect land, forests, biodiversity, rivers and the livelihood of millions of people**.
- The Ken-Betwa link threatens about 200 sq. km of the Panna tiger reserve.
- Interlinking of rivers will lead to **destruction of forests, wetlands and local water bodies**, which are major groundwater recharge mechanisms.
- Less than positive experience that other countries have, like diversion of Amu Darya and the Syr Darya or the Australia's experiments in its Murray Darling basin.
- It causes massive **displacement of people**. Huge burden on the government to deal with the issue of rehabilitation of displaced people.
- Due to interlinking of rivers, there will be decrease in the amount of fresh water entering seas and this will cause a serious threat to the marine life.
- The Shah committee pointed out that the linking of rivers will affect natural supply of nutrients for agricultural lands through curtailing flooding of downstream areas.

Way forward:

- To look at water as a strategic resource for development.
- Environment is one issue where anyone of us should be concerned about.
- Best practices done by China and neighbouring countries needs to be looked upon.

- The biggest, cheapest, most benign, possibly fastest and most decentralized storage option for India is the groundwater
- Invest in water conservation, more efficient irrigation and better farm practices.
- Recycling of water for internal usage as that of Israel.
- We need a mandatory enforceable river policy aimed at treating rivers as national treasure.
- Accumulation of silt in huge quantities, particularly the Ganga and its tributaries. These rivers need to be desilted.
- River linking in the south and other parts which was undertaken in the past has been going well so such model needs to be taken forward.
- Planting trees on the river banks is one way of bringing life back to the rivers.
- Forest catchments will need to be restored, wastewater from industries and towns will need to be treated, sand mining need to be stopped.
- Need to build the responsibility, capability and accountability in our water management institutions to revive our rivers.
- The judicious use of canal water, growing crops that are appropriate to a region, encouraging drip irrigation and reviving traditional systems such as tanks.

Conclusion:

The river linking project is a great challenge and an opportunity to address the water issues arising out of climate change. The long-term solution to water scarcity lies in making the IRL project work by building a network of dams and canals across the length and breadth of the country. However, interlinking has to take place after a detailed study so that does not cause any problem to the environment or aquatic life.

The recent floods of catastrophic dimensions have ravaged many states in the country, don't you think this has proved the rejection of Gadgil panel report to be a costly error for people and environment? Critically analyse.(250 words)

Livemint

Why this question:

Gadgil panel report on rapid erosion of Western Ghats is back in focus amid floods.

Demand of the question:

The answer must analyse the key findings of the report and in what way the recommendations of the report were ignored and such an ignorance has actually led to intensification of the disasters marring the western Ghats.

Directive word:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When

'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction

Explain what is the issue.

Body

First explain what was Gadgil report all about? What were its key recommendations? Why was the report rejected and on what basis?

Then discuss its implications. Relate it to the current conditions of the western Ghats and associate it with the causative factors of the recent floods.

Conclusion

Conclude with solutions and way ahead.

Introduction:

The Centre constituted the 14-member **Western Ghats Ecology Expert Panel (WGEEP)** in 2010 under the chairmanship of noted **ecologist Madhav Gadgil**. It was tasked to look into **measures to arrest the ecological devastation from human activities in the Western Ghats**. The Gadgil panel report (2011) had **recommended controls on mineral extraction and mining**. It recommended **against building new large-scale dams and inter-basin diversions of rivers**.

Body:

Key recommendations:

- The Gadgil Committee divided the Western Ghats into **three ecologically sensitive zones (ESZ) the highest (ESZ1), high (ESZ2) and moderate sensitivity (ESZ3) zones**.
- This is in addition to the Protected Areas managed under acts such as the Wildlife Protection Act.
- It suggested that **ESZ1 and ESZ2 would be largely 'no-go' zones** implying mining, polluting industries as well as large-scale development activities, including new railway lines are restricted.
- It also objected to new dams, thermal power stations or massive windmill farms or new townships in ESZ1.
- The panel however gave **importance to the local communities and gram sabhas**, where they were given a larger say in deciding on matters relating to the ecology of these regions.
- **No more new hill stations, no change of land-use from forest to non-forest use, or public to private ownership and no more inter-basin diversions** of rivers in the Western Ghats
- It also called for **stricter regulation on tourism; phasing out of plastics and chemical fertilisers; a ban on diversion of forest land into non-forest applications; a ban on conversion of public lands into private lands**.

The Gadgil Panel report was rejected by the then Union Environment Minister and was also unacceptable to any of the six Western Ghats States. The recommendations, which have been ignored

by state governments, are back in focus as the states face monsoon fury with floods and landslides killing hundreds across Kerala, Karnataka and Maharashtra.

Implications of rejection of report:

- Most of the rivers in the Western Ghats are either dammed or diverted. West-flowing rivers have been virtually made into east-flowing rivers by violating all natural laws.
- Kerala has a total 5,924 quarries, an average of six quarries per panchayat, of which 3,332 are in the ecologically sensitive zones identified by Gadgil.
- The vibrations from these blasts are shaking the hills. **Sound waves go fastest in diamonds, and the next in granites.** The density variations arising out of quarrying are destroying millennia-old forests in the Western Ghats
- Most sites where landslides took place, in fact, fall into the zones which would otherwise have been marked ecologically sensitive, had the key recommendations of the report been adopted.
- Referring to the region, as the **“Protector of the Indian Peninsula”**, the report had raised alarm on the rapid erosion of natural capital for man-made capital in the Western Ghats, which has led to “excessive, unnecessary environmental damage”.
- Both the **Athirappally project in Kerala and Gundia hydel project in Karnataka** fall in ESZ1 zone, these projects should not be accorded environmental clearance.
- There is **premature silting up of reservoirs** due to the massive encroachment and deforestation of catchments consequent to dam construction. **Idukki dam** is a classic case wherein the entire catchment was encroached along with dam construction
- The large-scale shift to cultivation of soil-eroding monoculture plantations of tea, coffee, cardamom, rubber, banana, pineapple and timber on steep slopes, leading to increased surface run-off and low seepage deep into the soil.
- Land-use changes mapped by Kerala Forest Research Institute shows Wayanad has lost a forest cover of 1086 square km, an area larger than all of Delhi.
- The fragmentation of forests is also reflected in human-animal conflict that has been on a rise.
- Wayanad has also witnessed a change in temperature of 2-3 degrees, that otherwise happens over centuries, over a short span of years

Way forward:

- The Western Ghats States need to reconsider their stand in view of the recent calamity.
- The “environment vs development and livelihoods” debate should not be used to shield vested interests.
- **A different governance regime**, as suggested by the Gadgil panel, may be required to administer the Western Ghats.

- However, Kasturirangan panel's observation that results are better achieved through incentives than policing is valid.
- Indeed, the challenge is to set up decentralised, participatory institutions to manage hilly regions and river basins.
- The Centre should urge the States to accept the best in both the reports.
- It should not entertain any further reduction of ecologically sensitive areas, for nature's and hence people's sake.

Conclusion:

A policy shift is urgently warranted curtailing the environmentally disastrous practices and switching over to a more sustainable farming approach in the Western Ghats. **Decommissioning of dams and thermal projects** that have crossed their viable life span of 30-50 years in a phased manner is need of the hour.

In the backdrop of recent floods that deluged most parts of the country, don't you think the water footprint needs to be reinstated, and the relationship with water resources rebuilt to face a future of changing weather patterns? Elucidate.(250 words)

The hindu

Why this question:

The article captures the policy level lacunae and the lack of proper planning with respect to existing water resources that has led to the current conditions of floods in the country.

Key demand of the question:

The answer must discuss and detail upon need of conscious efforts in terms of planning and effective ways to rebuild the relationship with the water resources.

Directive:

***Elucidate** – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.*

Structure of the answer:

Introduction:

Describe the current flood situation being witnessed across the country.

Body:

The answer must discuss in detail the issue – causes of the flood situation; Large-scale urbanization, Dilution of laws, lack of planning etc.

Then discuss what should be done essentially to overcome the problem, take clues from the article and detail on the aspects that need focus.

Conclusion:

Conclude with way ahead.

Introduction:

In an unnerving reminder of last year's devastating floods, **Kerala's** worst in about 100 years, incessant precipitation has deluged many districts, causing havoc, snapping communication lines and claiming several lives. Rains have battered **Karnataka and Maharashtra**, too, leaving many dead and several missing. Meanwhile, dramatic visuals from **Madhya Pradesh, Rajasthan and Gujarat** have revealed

widespread distress. Parts of **Bihar and Assam** are also reeling under torrential rainfall, with a large number of people left battling grim circumstances.

Body:

The water footprint is a measure of humanity's appropriation of fresh water in volumes of water consumed and/or polluted. It helps us understand for what purposes our limited freshwater resources are being consumed and polluted.

Factors causing floods:

Natural factors:

- **More than average rainfall:**

- India's western coast has received above-average rainfall on account of sustained low-pressure conditions.

Anthropogenic factors:

- **Land use:**

- Injudicious use of land is responsible for making states more prone to floods and landslides.
- However, other factors such as a change in land use patterns and climate change could have contributed to the situation on the ground.

- **Deforestation:**

- Unfettered development activity had increased the chances of landslides, a major cause of casualties during the floods.

- **Uncontrolled urbanization:**

- The linear development which has been along major road networks, has completely ignored the varying and ecologically sensitive landscape.
- Substantial portions of revenue lands in the State are wetlands and forests, which has resulted in a shortage of buildable land parcels.
- This in turn is creating huge pressure on these ecologically fragile areas for conversion to government-supported infrastructure projects as well as private profit-making enterprises.

- **Poor planning:**

- The State Action Plans on Climate Change elucidate measures for disaster-risk reduction in the wake of an increasing frequency of heavy rainfall in turn leading to more flooding and landslides.

- Though plans and laws such as Integrated Water Resources Management or Coastal Regulation Zone Notification hold key solutions to natural disasters that are linked to water management, most of them are not implemented or followed to the letter.
- A lack of holistic and coordinated measures within planning departments has resulted in further problems
- **Roads, railway lines and housing colonies** being laid and built without regard for natural water ways, but with formal planning permission.
- **Dilution of laws:**
 - The need of the hour is for a review and revision of building bye-laws for urban and rural areas in accordance with bettering environmental sustainability.
 - For instance, in 2017, a judgment of the High Court of Kerala mandating the inclusion of a clause in building rules, and which said that ‘natural drains and streams shall not be obstructed by this development/building permit’, has yet to come into effect.
 - Further, the Kerala Conservation of Paddy Land and Wetland Act, 2008 — it has immense potential to preserve such land as natural watershed buffers — has suffered too many dilutions even as rampant reclamation of paddy lands continues.
- **Mismanagement of dams:**
 - For dams to truly tame floods, experts say dam reservoirs need to be relatively empty before the onset of rain. This was not the case in many states.
 - Local officials have been blamed for exacerbating the situation by failing to gradually open the dams dotting the state’s complex river network, waiting instead until they were already full before unleashing the excess water.
 - More flooding was caused by emergency releases from dams that were full. Despite forecasts of more rain, there were no controlled releases.
 - **World Bank analysis** while preparing the National Hydrology Project (NHP) in 2015 showed that although weather forecasts are more accurate now, dam managers (especially bureaucrats) are reluctant to authorise advance controlled releases.

Measures needed for flood management:

- The dire need is for **watershed-based master planning and development legislated guidelines** for each major river basin, especially those that impact densely populated settlements.
- There must be a demarcation of ecologically sensitive zones using existing village survey maps and public participation.

- There must be clear land use plan for these zones specifying flood plains, protected forest areas, agricultural and plantation zones, with details of the types of crops, building usages permitted and the density of buildings permitted.
- To compensate owners in non-buildable areas, there must be strategies such as Transfer of Development Rights to buildable zones in cities.
- The master plan should focus on permitting only ecologically sensitive building strategies for these areas by proposing new construction techniques.
- Controlled development can be proposed using building height rules, floor area ratio control, and restrictions on cutting and filling natural land.
- Strategies to make sure that all infrastructure projects are carried out in a scientific manner with strict scrutiny must be specified.
- This should include roads built on difficult terrain and all public infrastructure projects in wetlands and the High Ranges.
- Copenhagen in Denmark, which faces a similar problem of repeated flooding, has come up with active cloudburst responsive planning as a process to develop the city in line with climate change needs.

Conclusion:

A complete overhaul of processes to hire technical expertise which allows access to necessary skills, and with a long-term vision of capacity building of local agencies, is the way forward.

Role of external state and non-state actors in creating challenges to internal security.

Discuss the important initiatives and laws taken by government of India to deal with Left wing extremism effected areas. (250 words)

Livemint

Why this question:

The question is straightforward and is about discussing the important initiatives and laws taken by government of India to deal with Left wing extremism effected areas.

Key demand of the question:

The answer must discuss important initiatives and laws taken by government of India to deal with Left wing extremism effected areas.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start by pointing out the regions effected by LWE in India.

Body:

Explain that in order to holistically address the LWE problem in an effective manner, Government has formulated National Policy and Action Plan adopting multi-pronged strategy in the areas of security, development, ensuring rights & entitlement of local communities etc.

Brief upon the various schemes undertaken – Security Related Expenditure (SRE) Scheme, Special Central Assistance (SCA) for 30 most LWE affected districts, Scheme of Fortified Police stations etc.

Conclusion:

Conclude that an ideology based on violence and annihilation is doomed to fail in a democracy which offers legitimate forums of grievance redressal. Thus steps are required to tackle the issue in the right direction.

Introduction:

Left Wing Extremism (LWE) movement has its roots in the Naxalbari area W.Bengal in the 1960's. These Maoists insurgents started running a parallel system of administration in parts of central and Eastern India. They kill civilians, destroy public buildings and extract ransom from businessmen. In the recent years, however, LWE movement is showing decline, because of the shift in the approach of the successive Governments

Body:**Government approach on security front:**

- In the past operations like **Operation Steeplechase, Operation Greenhunt and Operation Greyhound (Andhra Pradesh)** were used to tackle the Naxalites. The **Combat Resolute Action force (COBRA)** is still in place which performs combing actions against Naxal Spread and influence.
- Government would try to bring the insurgents on negotiation table, and offer ceasefire. But the insurgents would misuse the ceasefire to mobilize more weapons and troops.
- Central Armed Police Forces (CAPF) would conduct "Area domination exercises", But when insurgents feel strong presence of CRPF, they would simply vanish, and the moment CRPF retreated, they would come back in the area.
- Because of the above constraints government changed the strategy. Instead of offering ceasefire or conducting area domination exercises, it focused on (surgical) strikes based on hard intelligence. As a result, many of the key leaders have been arrested or eliminated, and the armed insurgent camps have been decimated.
- **Security Related Expenditure (SRE) Scheme** Under this scheme funds are provided to states for meeting the recurring expenditure relating to insurance, training and operational needs of the security forces, rehabilitation of Left Wing Extremist cadres (who surrender in accordance with the surrender and rehabilitation policy of the State Government concerned), community policing, security related infrastructure for village defence committees and publicity material
- **Scheme of Fortified Police Stations:** Some 400 police stations in 9 LWE affected States at a unit cost Rs. 2 crores were sanctioned under this scheme Civic Action Programme Under this scheme financial grants are sanctioned to CAPFs to undertake civic action in the affected states.

- **Surrender Policies by State Governments:** Naxal-affected states have also announced surrender policies whereby they offer cash assistance, land and other benefits in lieu of surrender. However, there is no effective intelligence mechanism to identify Naxal cadres.
- **Special Infrastructure Scheme (SIS)** to construct fortified police stations.
- 2016's **demonetization drive** also affected the LWE-funding
- Further, in 2017, Home Ministry launched '**SAMADHAN**' doctrine. It involves:
 - Controlling arms supply to Maoist using GPS trackers and Unique Identification number (UID) for Gelatin sticks and explosives manufacturers.
 - Each CRPF battalion deployed in the Maoist hotbed is given atleast one UAV.
 - More helicopter support for operations, including private helicopter services.
 - Joint Task Forces along inter-State boundaries, better inter-state coordination and intelligence sharing.
 - Stricter implementation of Prevention of Money Laundering Act (PMLA) to choke funding to LWE groups.

Government approach on Development front:

- In 2014: Ministry of Tribal Affairs launched **Vanbandhu Kalyan Yojana** for holistic development of the tribal people by targeting their education, employment, healthcare, infrastructure and connectivity.
- In 2015: Mines and Minerals (Development and Regulation) Act was amended to setup District Mineral Foundation (DMF). Through this fund, all mining districts receive portion of the mining royalties. The money is spent on the development activities decided by the local people.
- **Civic Action Plan:** Each CRPF company is given Rs.3 lakh for holding medical camps, sanitation drives, sports meets, distribution of study material to children, minor repairs of school building, road, bridges to build confidence among the locals.
- **Media Action Plan:** Each district is given Rs.7 lakh to advertise Government schemes.
- Union Government is organizing extensive training and capacity building programs for of the state service officials for **implementation of Forest Rights act and PESA Act.**
- **Additional Central Assistance' (ACA) for LWE affected districts** for creating public infrastructures and services such as school, hospital, road and rail connectivity, mobile connectivity, and electricity network.
- Schemes employment, skill development, ITI construction etc. have special funds earmarked for LWE with Key Performance Indicators (KPI).

- Union Government implemented the 14th Finance Commission report due to which LWE State Governments have more funds at their disposal to carry out tailor-made developmental schemes as per their requirements.
- In order to holistically address the LWE problem in an effective manner, Government has formulated National Policy and Action Plan adopting multi-pronged strategy in the areas of security, development, ensuring rights & entitlement of local communities etc.

Conclusion:

The issues of internal armed rebellion are sensitive and needs a strategic multi-pronged approach of deterrence and development. Militarization against own countrymen will not bring any solution. The government has to reach out to the local people and ascertain them of their good intent of bright futures for their children in education and peace.

The Maoist insurgency doctrine often glorifies violence as the primary means to overwhelm the existing socio-economic and political structures. Critically analyse the statement with examples.(250 words)

Reference

Why this question:

The question is based on the theme of Maoist insurgency, its spread, causes and repercussions.

Key demand of the question:

Explain in detail the Maoist insurgency doctrine, its philosophical basis and in what way it can be overcome.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Explain the background of the question.

Body:

Explain the dynamics Of Maoist Insurgency in India.

Discuss what are the factors responsible for the growth and spread of Maoism in India. In areas under Maoist domination, the absence of governance becomes a self- fulfilling prophecy since the delivery systems are extinguished through killings and intimidation. This is the first step in the strategy of the Maoists to seek to control the countryside. Explain how they stridently take up issues like ‘displacement of tribals’, ‘corporate exploitation’, ‘human rights violations’ by security forces etc. and often make fantastic claims in this regard which get reported even by the mainstream media etc.

Suggest what needs to be done.

Discuss few initiatives taken by the government to tackle the issue.

Conclusion:

Conclude with way forward.

Introduction:

The Naxalite–Maoist insurgency is an ongoing conflict between Maoist groups known as Naxalites or Naxals and the Indian government. Maoism is a form of communism developed by Mao Tse Tung. It

is a doctrine **to capture State power through a combination of armed insurgency, mass mobilization and strategic alliances**. Since its inception at Telangana in the 1930s, the insurgent movement has become one of the major threats to the democratic structure and internal security of the Indian nation.

Body:

Glorification of Violence as solution to problems:

- Some sections of the society, especially the younger generation, have romantic illusions about the Maoists, arising out of an incomplete understanding of their ideology. The central theme of Maoist ideology is violence.
- The Peoples Liberation Guerilla Army (PLGA), the armed wing of CPI (Maoist), has been created with this purpose in mind. In the first stage of the insurgency, the PLGA resorts to guerrilla warfare, which primarily aims at creating a vacuum at the grass-roots level of the existing governance structures.
- This is achieved by **killing lower-level government officials, police-personnel of the local police stations, the workers of mainstream political parties and the people's representatives of the Panchayati Raj system**.
- After creating a political and governance vacuum, they **coerce the local population** to join the movement. A strident propaganda is also carried out against the purported and real inadequacies of the existing state structure.
- In areas under Maoist domination, the **absence of governance becomes a self- fulfilling prophecy** since the delivery systems are extinguished through killings and intimidation.
- Most of the Front Organisations are led by well-educated intellectuals with a firm belief in the Maoist insurgency doctrine. These ideologues function as masks to cover the violent nature of the CPI (Maoist) ideology. They also form the propaganda/disinformation machinery of the party.
- They stridently take up issues like 'displacement of tribals', 'corporate exploitation', 'human rights violations' by security forces etc. and often make fantastic claims in this regard which get reported even by the mainstream media.
- The Front Organisations also skilfully use state structures and legal processes to further the Maoist agenda and weaken the enforcement regime. The important functions of these Organisations include **recruitment of 'professional revolutionaries', raising funds for the insurgency, creating urban shelters for underground cadres, providing legal assistance to arrested cadres and mass- mobilisation by agitating over issues of relevance/ convenience**.
- In a nutshell, the CPI (Maoist), the main LWE outfit in India, aims to overthrow the existing democratic state structure with violence as their primary weapon, and mass mobilization and strategic united fronts as complementary components and plans to usher in So-called 'New Democratic Revolution' in India.

However, the socio-economic underdevelopment is the naked truth which has driven Naxalism to its work. Government has taken many initiatives to step up the development in the underdeveloped areas.

- In 2014: Ministry of Tribal Affairs launched **Vanbandhu Kalyan Yojana** for holistic development of the tribal people by targeting their education, employment, healthcare, infrastructure and connectivity.
- In 2015: Mines and Minerals (Development and Regulation) Act was amended to setup District Mineral Foundation (DMF). Through this fund, all mining districts receive portion of the mining royalties. The money is spent on the development activities decided by the local people.
- **Civic Action Plan:** Each CRPF company is given Rs.3 lakh for holding medical camps, sanitation drives, sports meets, distribution of study material to children, minor repairs of school building, road, bridges to build confidence among the locals.
- **Media Action Plan:** Each district is given Rs.7 lakh to advertise Government schemes.
- Union Government is organizing extensive training and capacity building programs for of the state service officials for **implementation of Forest Rights act and PESA Act.**
- **Additional Central Assistance' (ACA) for LWE affected districts** for creating public infrastructures and services such as school, hospital, road and rail connectivity, mobile connectivity, and electricity network.
- Schemes employment, skill development, ITI construction etc. have special funds earmarked for LWE with Key Performance Indicators (KPI).
- Union Government implemented the 14th Finance Commission report due to which LWE State Governments have more funds at their disposal to carry out tailor-made developmental schemes as per their requirements.
- In order to holistically address the LWE problem in an effective manner, Government has formulated National Policy and Action Plan adopting multi-pronged strategy in the areas of security, development, ensuring rights & entitlement of local communities etc.

Conclusion:

It is imperative that government instead of being reactionary goes after them proactively. But it has herculean challenge of doing it in democratic way. It is obvious that there is and should be two pronged approach to counter it, one at ideological level and other at physical level. In former case, good governance by government and delivering good results in fields of Education, Health and overall standard of living will be instrumental.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention

Discuss the most prominently witnessed internal security threats due to social media also discuss the Existing laws for regulation over electronic media in India.(250 words)

The hindu

Why this question:

The question is directly from the static portions of GS paper III.

Key demand of the question:

Explain in detail the prominent internal security challenges/threats that have been witnessed or being witnessed due to social media and one must explain the laws and regulations in place to curb the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Body:

Explain how Spread of social media and cell phones has created the phenomenon of 'flash crowds' at the site of encounters. In addition, media like Facebook and YouTube are being used to great advantage to carry out propaganda.

One can discuss recent examples/incidences to substantiate the possible threats posed by social media on the internal security aspects of the country.

Then move on to detail upon the Existing laws for regulation over electronic media in India.

Conclusion:

Conclude that a serious and clear debate on the issue of freedom of expression, social responsibility, anonymity and data security is the need of the hour. And social media needs to be managed with proper and strict regulations in place.

Introduction:

Social Media can be defined as any web or mobile based platform that enables an individual or agency to communicate interactively and enables exchange of user generated content and it is explained by a number of tools, which includes blogs, Wikis, discussion forums, micro-blogs, twitter and social networking sites. Social Media in recent times has become synonymous with Social Networking sites such as Facebook or Micro Blogging sites such as Twitter.

Body:

Social media threat to nation's internal security

- The advantages of Social media are so many but they are posing threat to Internal Security in various forms like Cyber Terrorism, Fraud, crime, spreading violence, etc.
- According to the Cisco 2013 Annual Security Report, the highest concentration of online security threats is on mass audience sites, including social media. The rapid spread of false information

through social media is among the emerging risks identified by the World Economic Forum in its **Global Risks 2013 Report**.

- With limited government oversight, industry standards or incentives to educate users on security, privacy and identity protection, users are exposed to identity theft and fraud.
- Additionally, these platforms have huge confidential user information, and are likely vulnerable to outside or inside attack which is detrimental to Internal Security.
- **Radicalization: In Recruitment from other countries:**
 - ISIS is using the network of their recruiters around the world & paying them \$2000 to \$10000 depending upon who is recruited. Recruiters are using social media platform.
 - They are releasing videos of to target individuals who are susceptible to its message of violence and adventure.
 - ISIS has also benefited from “disseminators”, individuals who are sympathetic to their cause but not fighting for them.
- **Fake News:**
 - Competition among websites and social media platforms has sometimes resulted in the generation of fake news.
 - Everyone is in hurry to LIKE/SHARE/COMMENT rather than checking the authenticity of the news.
 - The most common fake stories revolve around politics and the attempt is to polarise society, particularly during political events.
- **Cyber Terrorism:**
 - The biggest challenge for internal security of nation through social networking site is cyber terrorism.
 - Today terrorists select Social Media as a practical alternative to disturb the function of nations and other business activities because this technique has potential to cause huge damage. It poses enormous threat in international system and attracts the mass media, the security community, and the information technology corporation.
 - At the same time, due to the convenience, affordability and broad reach of social media platforms like YouTube, Facebook and Twitter, terrorist groups have increasingly used social media to further their goals and spread their message.
 - Social Media became a platform for coordination of plans of attack, communication with cells, or propaganda and information and spread of hate campaign or messages that can hurt the sentiments of people.

- Chat rooms and electronic forums enable the insurgent and extremists groups to communicate with members and supporters all over the world, to recruit new followers and to share information at little risk of identification by authorities.
- **International users:**
 - The other national and international users such as the political parties, NGO's, hackers pose a serious threat using the social media. For example, during the civil turmoil in the Arab Spring Uprising, the various governments were threatened through the social media.
- **To Bring Revolution:**
 - Some countries in the world feel threatened by the fact that social media can bring the people together and thus, create a revolution. This in turn can cause political instability
- **Communal Violence and Fanning Tensions:**
 - Importantly, social media also seems to be playing a significant role in polarising different communities in India and compounding India's Security challenges. The viral videos and false updates of communal clashes, riots and terrorists attack have created a massive impact in the life of public.
 - Mobile and social network interface was used to send offensive clips and hate messages that triggered panic and mass exodus of north east Indians from large parts of India in the aftermath of the ethnic clashes in Assam in 2012.
 - In September 2013, a morphed video on YouTube was used to fan communal riots in Muzaffarnagar in Uttar Pradesh and led to mass panic.
- **Virtual Community:**
 - Popular social networking websites are another means of attracting potential members and followers. These types of virtual communities are growing increasingly popular all over the world, especially among younger demographics. This can build Anti-national Sentiments among Society.
- **Fraud:**
 - Social networking sites also invite fraudsters to take excellent opportunity to become wealthy by applying deceiver schemes.
- **Criminal Activity and Money laundering:**
 - Social networking sites also pose major challenge in financial and organized crime which destabilizes the system. It creates threat to a company's security because of what employees might disclose and they are on prime target for cyber criminals.

Existing laws for regulation over electronic media in India

- Information Technology Act 2000
- Draft Data Protection Bill

Way forward:

- Institutionalise the blueprint for a National Social Media Policy:
 - The Indian establishment needs to recognise the medium and grant it a legal status if it needs to deal with the multitude of challenges that rise out of it effectively.
 - The National Cyber Security Policy needs to be revised to include social media challenges which are distinct from the cyber security threats.
- Replicate “Social Media Labs” across the country.
- Serious and clear headed debate on the issue of freedom of expression, social responsibility, anonymity and data security is the need of the hour.

Meticulous co-operation and intelligence-sharing are needed between the countries to fight the new age terrorism which has global reach and sophisticated tools at its disposal.
Discuss.(250 words)

Reference

Why this question:

Key demand of the question:

Explain in detail the need for Meticulous co-operation and intelligence-sharing are needed between the countries to fight the new age terrorism.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

State the present challenges or the ones faced in the past on this front.

Body:

Briefly define terrorism and state with examples of how a new version of terrorism has evolved. Discuss the reasons that led to the emergence of new age terrorism. Suggest way forward how countries should tackle this threat and conclude suitably.

Conclusion:

Conclude by suggesting solutions to the issue.

Introduction:

International terrorism poses an increasingly dangerous and difficult threat to world. Today’s terrorists seek to inflict mass casualties, and they are attempting to do so across globe. They are less dependent on state sponsorship and are, instead, forming loose, transnational affiliations based on religious or ideological affinity and a common hatred. This makes terrorist attacks more difficult to detect and prevent.

Body:

Trends in Terrorism:

44% Since peaking in 2014, deaths from terrorism have fallen 44%.

60 Since 2012, more than 60 countries experience at least one fatal terrorist attack each year.

Source: START GTD, IEP Calculations

The increase in attacks and deaths across more countries has meant that the impact of terrorism is becoming more widespread, even as deaths from terrorism are decreasing. As the intensity of terrorism has increased over the last two decades, its impact has also spread to more countries around the world.

Measures need to tackle global terrorism:

- A comprehensive and multidimensional strategy for the “War on Terror” must involve an integrated view of these strategic military and economic domains, among others.
- Addressing UN High-Level conference on Heads of Counter Terrorism, India extended a five-point formula –
 - Exchange of timely and actionable intelligence.
 - Prevention of misuse of modern communication through collaboration with the private sector.
 - Building capacities for improved border controls.
 - Sharing of info related to the movement of passengers.
 - Designation of Counter-Terror focal points to fight global terror.
- In addition, there should be a concerted effort from the countries affected by the scourge of terrorism to pressurize countries who engage in state-sponsored terrorism.
- It is necessary for countries fighting terrorism **to learn more closely from their differences, rather than try to generalise from experience.**

- The success or failure of each of these approaches must be studied & applied to smaller countries suffering from global terrorism based on applicability.
- **United Nations must become the global Centre to fight global terrorism.** For such, Comprehensive Convention on International Terrorism must be agreed upon on basis on common definition of terrorism.
- The functioning **UNSC 1267 Committee** should be strengthened.
- The complete implementation of **UN Global Counter-Terrorism Coordination Compact** that was agreed upon in 2018.
- **Intelligence sharing between countries** needs to be strengthened and countries currently not affected by global terrorism need to take the threat seriously.

Conclusion:

India should play a proactive role to neutralize any threat of terrorism. There is a need for the world to join hands and take concrete multilateral initiatives to ensure that terror groups are dealt with a heavy hand. Accepting and ratifying the Comprehensive Convention on International Terrorism (CCIT) proposed by India would be good first step.

What do you understand by Cyber warfare? Outline and discuss the cyber threats which India is vulnerable to and bring out the state of the country's preparedness to deal with the same. (250 words)

Economictimes

Why this question:

The question is based on the concept of cyber warfare.

Key demand of the question:

The answer must explain what is cyber warfare, India's preparedness aspects in detail.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is cyber warfare.

Body:

Discussion should include the following:

Discuss the concept of cyber warfare – Cyberwarfare is a broad term describing the use of technological force within cyberspace.

Then move on to discuss the preparedness aspect of India.

Conclusion:

Conclude with need for preparedness and readiness in terms of policies, force and laws.

Introduction:

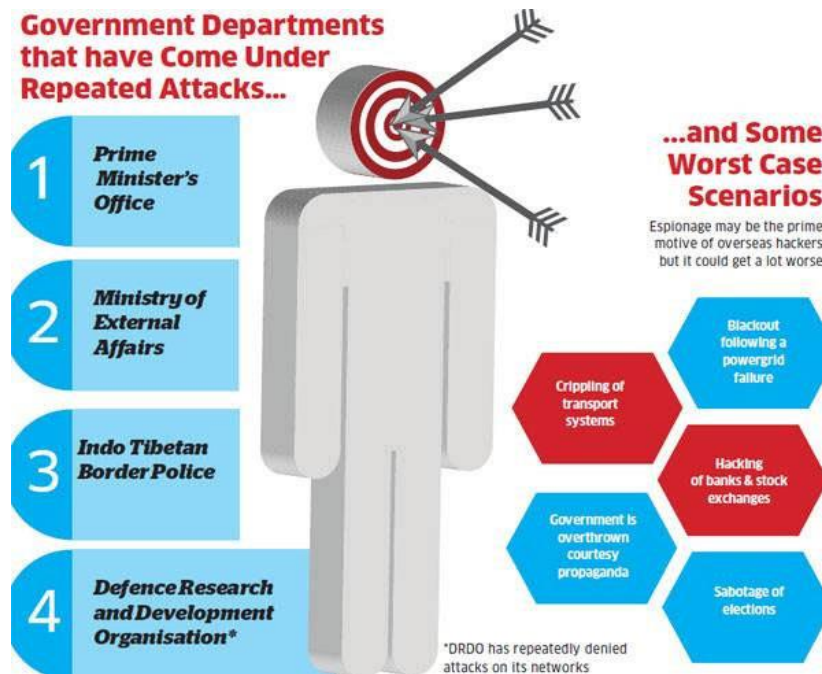

Cyber warfare is computer- or network-based conflict involving politically motivated attacks by a nation-state on another nation-state. In these types of attacks, nation-state actors attempt to disrupt

the activities of organizations or nation-states, especially for **strategic or military purposes and cyber espionage**.

Body:

It involves the actions by a nation-state or international organization to attack and attempt to damage another nation's computers or information networks through, for example, computer viruses or denial-of-service attacks.

India's vulnerabilities to cyber threats:

India's preparedness and challenges faced:

- The attacks can be more tangible causing damage to physical or digital infrastructure.
 - This includes a country's water system or electric grid.
 - Cyber tentacles can spread to political parties, universities and private businesses and Citizens.
 - Potentially worrisome cyber incidents include interference in political affairs, leaks and espionage and the compromising of critical national infrastructure.
- A 2017 study conducted by Symantec found that India ranked fourth in online security breaches, accounting for over 5 per cent of global threat detections. In the beginning of 2017, the newly launched Bharat Interface for Money application (BHIM app) reportedly faced spam threats.
- The real danger to India lies in targeted cyber attacks coming from adversarial nation states.

- Countries like China can bring immense assets to bear in carrying out sophisticated cyber attacks. The success of Stuxnet, which damaged the Iranian centrifuge facility at Natanz is an example.
- Cyber warfare is characterised by an absence of clarity.
 - India can never be certain about the capability of the other side and also the chances of success if we launch a cyber counterstrike.
- There is a push towards greater digital dependence with demonetisation a cashless system is being propagated. Aadhaar and the wider platforms such Digital India and Smart Cities will push things further along. India is the world's second largest digital nation with more than 350 million Indians are online and millions more will be getting connected in the years to come.
- India is not even a signatory to some of the basic international frameworks on Cybersecurity like the Convention of Cybercrime of the Council of Europe which not only European nations but Japan, US, South Africa have become signatories to, except India.
- Indian laws are not in tandem with the ever-changing global cyberspace.
 - The laws are old and hence need to be more dynamic in nature to deal with issues like cyber-espionage, data theft and so on.
 - The Information Technology Act, 2000 (IT Act 2000) is the sole law that deals with cyberspace in India and was passed way back in 2000.
 - Also, the Cyber Law of India has been subject to amendments on various occasions but hasn't served the changing dynamics and the growing threats and manifestations of cyberwar.

Measures needed:

- **A Defence Cyber Agency** could be the first step the government plans to for critical infrastructure and military networks that are increasingly becoming dependent on the Internet, thus increasing vulnerabilities.
- The Defence Cyber Agency will work in coordination with the National Cyber Security Advisor. It will have more than 1,000 experts who will be distributed into a number of formations of the Army, Navy and IAF. According to reports, the new Defence Cyber Agency will have both offensive and defensive capacity.
- Equally important is **cyber propaganda**. During the Doklam conflict, China tried its best to unleash cyber propaganda on India and indulged in complex psy-ops
- **Critical cyber infrastructure** needs to be defended and the establishment of **the National Critical Information Infrastructure Protection Centre(NCIIPC)** is a good step in this direction
- Individual ministries and private companies must also put procedures in place to honestly report breaches. It is only then that the NCIIPC can provide the requisite tools to secure these

networks. This partnership must be transparent and not mired in the usual secrecy of intelligence organisations.

- The **upgrading of the Defence Cyber Agency to a Cyber Command** must be implemented at the soonest.
- A robust ecosystem must be built to secure India from acts of state and non-state actors, including protocol for grievance redressal in international forums.
- Better capabilities must be built to detect and deflect attacks.
- The **computer emergency response team (CERT)** must be strengthened and aligned with military and foreign affairs operations.
- Building a joint task force between the government and key technology players will be crucial.
- The government should push for the creation of a **global charter of digital human rights**.
- A **national gold standard** should be created, which ensures that Indian hardware and software companies adhere to the highest safety protocols
- Impart cybercrime investigation training and technological know-how to the various law enforcement agencies.
- **Cyber awareness** must be spread and there should be multi-stakeholder approach- technological inputs, legal inputs, strengthening law enforcements, systems and then dealing with transborder crime involves lot of international cooperation.

Conclusion:

Most of the Indian banking industry and financial institutions have embraced IT to its full optimization. Reports suggest that cyber-attacks are understandably directed toward economic and financial institutions. With innovative, technology led programmes such as AADHAAR, MyGov, GeM, Digital Locker the new India is the land of technological prowess and transformation. Government and the private sector jointly have to give cyber security some priority in their security and risk management plan.

Proactive participation of state governments is one of the best possible ways to battle Maoist insurgency in the country. Analyse.(250 words)

[Indianexpress](#)

Why this question:

The question aims to analyse the role of state govt. in tackling the problem of Maoist insurgency.

Key demand of the question:

The answer must discuss in what way the long-standing internal national security threat can be handled with active participation of state governments.

Directive:

analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Begin with brief on the current situations of Maoist insurgencies in the country.

Body:

Discussion should include the following:

First explain the scenario of insurgency in the country and expanse, in what way can the insurgency be handled through proactive engagement of government. Take hints from the article and discuss the same with suitable illustrations.

Conclusion:

Conclude with way forward.

Introduction:

In 2006, then Prime Minister Manmohan Singh named Maoist insurgency as “the single biggest internal-security challenge” the country has ever faced. While security forces have made continuous inroads, the Central Committee of the CPI (Maoist) has repeatedly admitted in various reports and meetings that their base area has shrunk, fresh recruitment almost dried up, and desertions increased.

Body:**States’ response to Maoist insurgency:**

- States’ response to the Maoist insurgency has evolved over the years, influenced by both the intensity of threat and the nature of political dispensation at the Centre and the affected states.
- While the previous United Progressive Alliance (UPA) government laid the foundation for the country’s Counter-Insurgency (COIN) strategy, the current National Democratic Alliance (NDA) government has accelerated the pace and enhanced the effectiveness.
- Various COIN initiatives have been an amalgamation of both population-centric and enemy-centric approaches, combining law-and-order mechanisms and development instruments.
- Given that law and order is under the purview of the states or provinces, the most crucial counterinsurgency efforts are in the hands of state-level leadership.
- The federal government supported these efforts with joint strategies, resources, intelligence and coordination.
- **Andhra Pradesh and Chhattisgarh:**
 - Different states have pursued different strategies with different levels of effectiveness. For example, while **Chhattisgarh** has struggled to clean up its part of the so-called “**Red Corridor**”, **Andhra Pradesh’s Greyhounds**, an elite anti-Maoist military unit raised in 1989, have done a stellar job of not just chasing the Maoists out of the state but of keeping them out as well.
 - The Andhra Pradesh state succeeded in stamping out left-wing extremism by **combining police action with socio-economic programmes** implemented by an **effective service delivery mechanism**.

- The Greyhounds have also inspired similar units raised specifically to fight asymmetric wars in jungle terrain, including the **CRPF's Commando Battalions for Resolute Action (CoBRA)**.
- In fact, CoBRA is part of the Union government's anti-Maoist campaign launched in 2009, commonly referred to as **Operation Green Hunt**—a search-and-destroy campaign to clear out the jungles—which prompted massive retaliatory attacks on security forces.
- The state governments took proactive steps by deploying additional resources and are trying their best to check Maoists' expansion.
- In **Chhattisgarh**, many new police stations and security camps have been established. The SP, Kabirdham, organised a number of awareness campaigns in remote areas which are most vulnerable to Maoist influence. He made arrangements for villagers' training and facilitated government employment for hundreds.
- Counter-insurgency strategy involved the nurturing and strengthening of a vigilante group, popularly called **Salwa Judum (or Purification Hunt)**. The Chhattisgarh state government supported the Salwa Judum movement by creating a local militia called Special Police Officers (SPOs) comprising former rebels and local youth.
- The state government also adopted a **Surrender and Rehabilitation policy** and passed the **Chhattisgarh Special Public Securities Act, 2006**, which dramatically expanded the ambit of "unlawful" activities including verbal or oral communications.
- The game-changer seems to have been the **improved road connectivity**: 11 key road projects were finished by 2018, connecting the Sukma, Bijapur and Jagdalpur districts.
- In addition, **enhanced combat capability of local police through modernisation and fortified police stations and improved coordination between Centre and state** in intelligence and paramilitary support are resulting in palpable decrease in Maoist threat.
- **Jharkhand & Odisha:**
 - The most crucial operation for Jharkhand's state forces was the ambitious plan to recapture the forested region of Saranda, which has been a Maoist stronghold since the early 2000s.
 - Together with central forces, the state launched **Operation Anaconda** to weed out Maoists from Saranda and succeeded in 2011. The Central government immediately framed the Saranda Development Plan in 2012.
 - In Odisha, the hotspots of Maoist activities were the most backward and forested, mineral-rich districts with huge adivasi populations—i.e., **Koraput, Malkanagiri, Nabarangapur, Rayagada, Gajapati, Kandhmal and Ganjam and Keonjhar**.
 - State response to left-wing extremism in Odisha was not very different from that of other Maoist-affected states: **from loud denial to grudging acceptance**.

- The State also opened a **training school** in each of the seven police ranges, supplemented by 17 battalions of Central forces stationed in key Naxal-affected districts.
- One of these measures was the **allotment of patta (land entitlements) to adivasis** across several Naxal-infested districts.
- The State also came out with a **model Resettlement and Rehabilitation Policy** to address some of the core issues related to land acquisition and displacement.
- There were also efforts to **conduct food rationing, implement a job scheme, construct roads, and undertake livelihood and entitlements-based programmes.**
- **Bihar, Madhya Pradesh, Maharashtra and West Bengal** too has intensified anti-Maoist operations on the above lines in LWE affected areas.

Way forward:

- Though, Maoists have weakened in states, and their expansionist policy is under check, security forces cannot afford to ignore their protracted war strategy.
- The mobile war (capability to attack at will in base areas and escape unscathed) has to be reversed and the areas of security vacuum (where there is no presence of the security forces) plugged.
- Better technologies, including **Ground Penetration Radar**, are required to detect and defuse IEDs.
- Security forces also need to learn from previous tactical errors and adhere to time-proven SOPs.
- The information network should improve with better road and telecom connectivity in far-flung areas. Surrender and rehabilitation policies must be implemented in letter and spirit.
- The administrative and political vacuum in remote areas must be filled.
- **'The Forest Rights Act'** should be interpreted in favour of forest dwellers. The root cause of the problem that is exploited by the Maoists —socio-economic deficits — must be bridged.
- The human rights of the local populace must be protected by the administration and security forces if the credibility of efforts so far is to be established.

Conclusion:

. The states aimed, and succeeded to a significant degree, to puncture the **Maoist narrative of “an exploitative state run by the bourgeoisie”**. In a show of cooperative federalism—evident from **institutional coordination and the implementation of joint mechanisms**—both Centre and states have exhibited a clear common purpose in counterinsurgency and reducing LWE violence.

What is money laundering? Examine the recent policy efforts by the Government of India to tackle the problem.(250 words)

Livemint

Why this question:

The CBI's case is that the INX Media allegedly flouted the conditional FIPB approval, and brought in over ₹305 crore of FDI against the approved inflow

CBI alleges that INX Media engaged Karti Chidambaram, the promoter director of Chess Management, to resolve the issue.

Key demand of the question:

The question aims to evaluate in detail about money laundering- definition, purpose, means etc. It also wants us to discuss the available policies such as PMLA to tackle the same.

Directive:

Examine – When asked to 'Examine', we must investigate the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Write a few lines about the meaning of money laundering- e.g Money laundering is the process of creating the appearance that large amounts of money obtained from criminal activity, such as drug trafficking or terrorist activity, originated from a legitimate source. The money from the illicit activity is considered dirty, and the process "launders" the money to make it look clean.

Body:

Discuss the steps in money laundering- Placement-criminally derived funds are introduced in the financial system; Layering-the property is 'washed' and its ownership and source is disguised; Integration- 'laundered' property is re-introduced into the legitimate economy; This three staged definition of money laundering is highly simplistic. The reality is that the so-called stages often overlap and, in some cases, for example in cases of financial crimes, there is no requirement for the proceeds of crime to be 'placed'.

Briefly explain how globalization impacts money laundering.

Examine the recent policy efforts taken by the government – India is a full-fledged member of the Financial Action Task Force (FATF), PMLA 2002, Financial intelligence unit -IND etc.

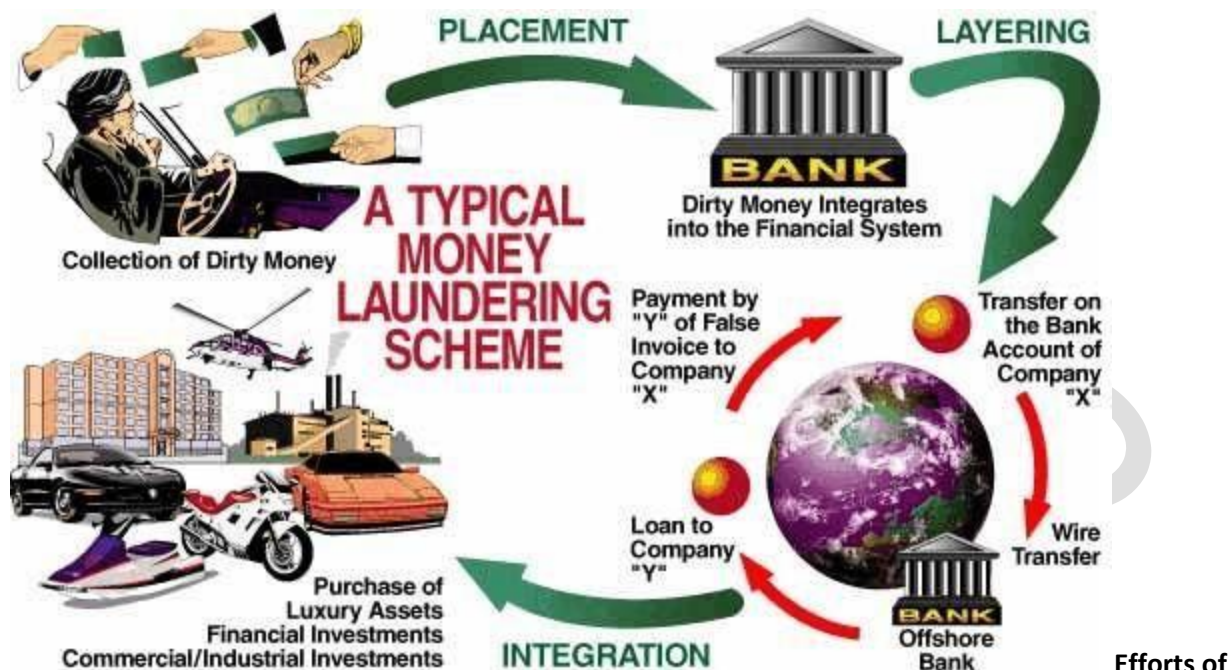

Conclusion:

Conclude with way forward.

Introduction:

Money laundering is a process where the proceeds of crime are transformed into apparently legitimate money or other assets. It is the processing of criminal proceeds to disguise its illegal origin. In simple words, it can be defined as the act of making money that comes from one source to look like it comes from another source. Money laundering is a single process however, its cycle can be broken down into three distinct stages namely, placement stage, layering stage and integration stage.

Body:

Government of India to address money laundering:

In India, before the enactment of Prevention of Money Laundering Act, 2002 (PMLA) the major statutes that incorporated measures to address the problem of money laundering were:

PMLA Act:

- It prescribes obligation of banking companies, financial institutions and intermediaries for verification and maintenance of records of the identity of all its clients and also of all transactions and for furnishing information of such transactions in prescribed form to the Financial Intelligence Unit-India (FIU-IND).
- It empowers the Director of FIU-IND to impose fine on banking company, financial institution or intermediary if they or any of its officers fails to comply with the provisions of the Act as indicated above.
- PMLA envisages setting up of an Adjudicating Authority to exercise jurisdiction, power and authority conferred by it essentially to confirm attachment or order confiscation of attached properties.

The Black money (undisclosed foreign income and assets) and Imposition of Tax Act, 2015:

- To deal with the menace of the black money existing in the form of undisclosed foreign income and assets by setting out the procedure for dealing with such income and assets.

Benami Transactions (Prohibition) Amendment Bill, 2015:

- It aims to expand the definition of Benami Transactions and specifies the penalty to be imposed on a person entering into a Benami transaction.

Institutional framework:**Enforcement directorate:**

- PMLA empowers certain officers of the Directorate of Enforcement to carry out investigations in cases involving offence of money laundering and also to attach the property involved in money laundering.

Financial Intelligence Unit:

- It was established in India in 2004 as the central national agency responsible for receiving, processing, analyzing and disseminating information relating to suspect financial transactions.
- FIU-IND is also responsible for coordinating and strengthening efforts of national and international intelligence, investigation and enforcement agencies in pursuing the global efforts against money laundering and related crimes.
- FIU-IND is an independent body reporting directly to the Economic Intelligence Council (EIC) headed by the Finance Minister.

Way forward:

- Make common people more aware about the problem- The poor and illiterate people, instead of going through lengthy paper work transactions in Banks, prefer the Hawala system which needs to be stopped.
- Fulfilling the purpose of KYC Norms by doing proper KYC.
- Establishment of comprehensive enforcement agencies
- Promote cashless digital transaction

In most cases, Data deprivation makes cybercrime difficult to tackle. While privacy and data protection are necessary, and data localization may pose its own business challenges, India needs to work out a way to crack cyber frauds and crimes. Elucidate.(250 words)

[Livemint](#)

Why this question:

The question is based on the theme of rising cyber crimes and cyber frauds being witnessed across the country.

Demand of the question:

Explain the changes in Sino-Indian relations, the causes and affect it has on the global politics.

Directive word:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction**

Discuss the recent controversies pos abrogation of article 370.

Body

One must explain the recent stances where the India and China had a face off, discuss the causes leading to such changing relations and explain what needs to be done to overcome it.

Such answers are best explained with examples to substantiate.

Conclusion

Conclude with what should be India's stand, what needs to be done to ensure peace and security of its borders and peaceful relations with neighborhood country.

Introduction:

Cybercrime is a criminal action that encompasses mobile phones, laptop, network, and computer. It is a threat to country's external and internal security and monetary status. Bengaluru registered the most number of cybercrime cases in 2018. The country's technology capital saw a whopping 5,035 FIRs registered

Body:

Instances of cybercrimes in recent times:

- there have been many instances of the hard-earned money of Indians being taken out of bank accounts and charges loaded onto credit cards through online frauds.
- Another emerging casualty of such cybercrimes is the emerging "startup" ecosystem.
- We are beginning to see multiple cases where customers of genuine startups, unicorns and Indian businesses have been subjected to online fraud.
- These customers initially presume that it is the customer care departments of the companies that have conned them, as we see in many of the cases that get filed.
- This is a dangerous trend. Not only does it shake people's faith in digital systems, the scepticism vis-à-vis online transactions also hurt the potential of emerging companies.

Data Localization – need and prospects:

- Data localization can broadly be defined as 'any legal limitation on data moving globally and compelling it to remain locally'.
- Data localisation laws refer to regulations that dictate how data on a nation's citizens is collected, processed and stored inside the country.
- The main intent behind data localisation is to protect the personal and financial information of the country's citizens and residents from foreign surveillance and give local governments and regulators the jurisdiction to call for the data when required.
- Data localisation is essential to national security. Storing of data locally is expected to help law-enforcement agencies to access information that is needed for the detection of a crime or to gather evidence.
- Where data is not localised, the agencies need to rely on mutual legal assistance treaties (MLATs) to obtain access, delaying investigations.

- On-shoring global data could also create domestic jobs and skills in data storage and analytics, as the Justice SriKrishna report had pointed out.

Challenges of Data localization:

- **Facebook's** Mark Zuckerberg recently expressed **apprehension about nations wanting to store data locally**. According to him, it gave rise to possibilities where authoritarian governments would have access to data for possible misuse.
- The US Electronic Communications Privacy Act bars US-based service providers from disclosing electronic communications to law enforcement agencies of any country unless US legal requirements are met.
- The U.S. criticised India's proposed norms on data localisation as 'most discriminatory' and 'trade-distortive'.
- **EU** termed data localisation as **unnecessary and potentially harmful** as they would create unnecessary costs, difficulties and uncertainties that could hamper business and investments.
- The **bilateral mechanism of the India-US Mutual Legal Assistance Treaty is a bit outdated** and does not seem to work.
- The US Cloud (Clarifying Lawful Overseas Use of Data) Act, however, enables law enforcement authorities in India to request electronic content directly from US service providers under an executive agreement with the US government.
- Data Localization **could affect expression rights** in a number of ways given that the Internet is built on the principle of easy transfer of information across borders.
- Localization may also permit **greater censorship of domestic dissident or political voices** and affect the extent to which Indian content is accessible abroad.
- One of the main arguments against mandatory localization stems from the **cost** that it is likely to impose on businesses and consequently, their consumers and the economy as a whole.

Way forward:

- **Data localisation is a critical necessity** for law enforcement.
- **Access to data by Indian law agencies**, in case of a breach or threat, cannot be dependent on the whims and fancies, nor on lengthy legal processes of another nation that hosts data generated in India.
- India urgently needs a **legally-backed framework** for a collaborative trigger mechanism that would bind all parties and enable law enforcers to act quickly and safeguard Indian citizens and businesses from a fast-growing menace.
- The customer also has a responsibility to **maintain basic cyber hygiene**, which includes following practices and taking precautions to keep one's sensitive information organized, safe and secure.

- **Real-time intelligence** is required for preventing and containing cyber attacks.
- **Periodical 'Backup of Data'** is a solution to ransomware.
- Using **Artificial Intelligence (AI)** for predicting and accurately identifying attacks.
- Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
- Increased awareness about cyber threats for which **digital literacy** is required first.

Conclusion:

All the players involved, including banks, telecom companies, financial service providers etc. and the government, need to play a responsible role in ensuring innocent citizens do not undergo the trauma of suffering losses. As a nation making a huge transition to a cashless economy, public faith in the digital system needs to be consistently reinforced.

Security challenges and their management in border areas; linkages of organized crime with terrorism

Border administration/ management is a multifaceted task due to difficult topography and challenging relations with some countries. Elucidate the challenges and approaches for effective border management.(250 words)

Why this question:

The question expects us to discuss the challenges of border management and the strategies India has employed to tackle such challenges.

Key demand of the question:

The answer must discuss the issues faced by the country in managing its borders owing to hostile relations with neighbours or other countries and in what way it should manage and handle.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Begin with brief introduction stating the context of the question.

Body:

Discussion should include the following:

Explain the existing issues India is facing on border security fronts.

Explain challenges – Unilateral actions by some nations to change the status quo in their favour.

Misuse of borders (especially porous open borders) for smuggling, illegal migration, etc.

Little or no support from counterparts of neighbouring nations and in some cases active support by cross border elements to illegal activities.

Cultural, ethnic and linguistic affinity across borders and clan loyalties

Multiple agencies are involved in border management, lack of Inter agency cooperation and coordination

Support of state and non-state actors to aid infiltration, smuggling, trafficking.

Then discuss the measures that can be taken.

Conclusion:

Conclude with way forward.

Introduction:

India has one of the longest and most varied of international borders. Historical and political reasons have left India with an artificial unnatural border. Border Management is an integral approach towards borders in which along with security enhancement, infrastructure & human development is undertaken. The challenge of coping with long-standing territorial and boundary disputes with China and Pakistan, combined with porous borders along some of the most difficult terrain in the world, has made effective and efficient border management a national priority.

Body:

India has had to deal with **numerous challenges** with respect to border management such as:

- India's rate of growth has far outpaced that of most of its neighbours and this has generated peculiar problems like mass migrations into India.
- **Current fence:**
 - The present one has a high rate of degradation due to snow and has to be repaired after every season which costs about Rs. 50-60 crore every year
 - Over time infiltrators have devised ways to cross it.
- India's internal security challenges are inextricably linked with border management. This is so because Indian insurgent groups have for long been provided shelter across the nation's borders by inimical neighbours.
- **No real-time coordination:**
 - Due to the lack of understanding of military issues among the decision-making elite, India's borders continue to be manned by a large number of military, paramilitary and police forces
 - Each of which has its own ethos and each of which reports to a different central ministry at New Delhi, with almost no real coordination in managing the borders.
- Border management is designed for a 'fire fighting' approach rather than a 'fire prevention' or pro-active approach
 - It is based on a strategy of 'reaction and retaliation' rather than on a holistic response to the prevailing environment, resulting in stress and decision making problems at the functional level.
- Due to the non-permanent presence of the Myanmar army in that region, the reason primarily being the hostile terrain, ousting the Indian militants remains a challenge.

- Similarly, ethnic rebels from Myanmar have found bases within states like Mizoram. Thus, the 1,643 kilometre long Indo-Myanmar border remains a challenge.
- The border security scenario is marked by
 - increased cross-border terrorism
 - infiltration and ex-filtration of armed militants
 - emergence of non-state actors
 - nexus between narcotics traffickers and arms smugglers
 - left-wing extremism
 - separatist movements aided and abetted by external powers
 - The establishment of madrasas, some of which are potential security hazards.
- Perennial and Seasonal Rivers via which terrorists can infiltrate.
- Un-demarcated boundaries with overlapping claims cause constant friction along borders.
- Mountainous and Hilly terrain especially in North Indian borders which are snow clad and inhabitable during winter season.
- Unilateral actions by some nations to change the status quo in their favour.
- **Little or no support from counterparts of neighbouring nations** and in some cases active support by cross border elements to illegal activities.
- Cultural, ethnic and linguistic affinity across borders and clan loyalties
- Multiple agencies are involved in border management, lack of Inter agency cooperation and coordination
- Support of state and non-state actors to aid infiltration, smuggling, trafficking etc.

Strategies for effective border management have been continuously evolving. Some of them are:

- 24x7x365 day surveillance along Indo-Pak border with **5 layer smart fence**
- Agreement on basic guiding principles and standard operating procedures
- Increasing confidence building measures and communication linkages to avoid unnecessary confrontation and escalation
- Integrated border management by involving and enhancing cooperation with counterparts of neighbouring countries especially along open borders.
- Effective implementation of the recommendations of **One Border One Force** by the Task Force on Border Management to weeds out inter agency frictions.

- **Community measures and awareness** can be deployed along open borders to prevent illegal activities.
- Implementation of **Border Area Development Programme** and other developmental initiatives so that there is no feeling of being left out.

Way forward:

- Infrastructure along with border has to be improved – **rail connectivity along with road connectivity** has to be provided for quick mobilization.
- Building of **additional checkpoints and Border posts** along major and minor trade routes connected with borders
- Building of **floating bridges, walls & electrical fences** where there is high probability of infiltration.
- Taking up of **joint Border management with Countries like Myanmar, Bhutan and Nepal**.
- **Improving healthcare, physical infrastructure and digital connectivity in villages** around borders thus making them stakeholder in Border Management.
- **Madhav Godbole task force** recommendations on border management need to be implemented.
- It had recommended that the **CRPF should be designated as the primary national level counter-insurgency force**. This would enable the other central paramilitary forces like the BSF and Indo-Tibetan Border Police to return to their primary role of better border management.
- It had also recommended that **all paramilitary forces managing unsettled borders should operate directly under the control of the army** and that there should be **lateral induction from the army to the paramilitary forces** so as to enhance their operational effectiveness.
- The **principle of 'single point control' must be followed** if the borders are to be effectively managed.
- The **advances in surveillance technology, particularly satellite and aerial imagery**, can help to maintain a constant vigil along the LAC and make it possible to reduce physical deployment.

Conclusion:

Keeping a strong vigil on its border is very important for any nation to check any kind of illegal activities or intrusion through them. For India, the task becomes difficult where terrain and climate is very complex across some of its border areas. Focussing on improved technology will help in making the task easier for the security forces and make its borders more secure.

Discuss the similarities between the terrorism and organised crime, also discuss what are the various facets of linkages between organized crimes and terrorism.(250 words)

Reference

Why this question:

The question is direct from the static portions of GS paper III.

Key demand of the question:

Explain in detail the linkages of terrorism and organized crime and the similarities between the two, one can discuss how it can be tackled.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define the terms – terrorism and organized crime.

Body:

Explain there are a number of increasingly similarities between terrorism and organized crime. Both use extreme violence and the threat of reprisals. Both use extreme violence and the threat of reprisals. Both use kidnappings, assassinations, and extortion. Both operate secretly, though at times publicly in friendly territory.

Discuss the challenges posed by them.

Conclusion:

Conclude by suggesting solutions.

Introduction:

Organized crime is described as any group having a corporate structure whose main aim is to obtain money through unlawful activities often surviving on fear and corruption. Terrorism is an act that appears to be intended to terrorise or force a civilian population to influence policy of a government by extortion or to affect the conduct of the government by assassination or abduction.

Body:

Similarities between terrorism and organized crimes:

- First similarity is that **both operate secretly**. Although both terrorist groups and criminal organizations have a strong central leadership, they are mainly based on cell structures to achieve their own goals. Day to day operations are carried out by members of small cells.
- **Both use violence and produce mostly civilian victims.**
- **Intimidation and fear** are characteristics of both groups.
- They use **similar tactics**, such as **kidnapping, assassination, extortion.**
- Terrorist and crime group organizations **use front organizations such as legitimate businesses or charities.**
- Both uses **similar ways to conceal profits and fund raising.**
- The activities of both groups are in cross the **national-regional transnational divide; both groups require safe havens**, and as a result both tend to take advantage of Diaspora communities.

- Both groups are **aided by corrupt officials whose services provide mutual benefits**, such as access to fraudulent documents, including passports and other identification and customs documents to smuggle goods and weapons.

Linkages between Organized crimes and terrorism:

- In general, there appear to be three ways that the crime-terror nexus interact:
 - Through shared tactics and methods;
 - Through the process of transformation from one type of group to the other over time; and JMLC
 - Through short- or long-term transaction-based service-for-hire activities between groups
- In present global climate, high profile crime is committed to gain power and generate huge funds to live lavishly. Researchers have stated that there is strong link between terrorists with criminal organizations.
- Both crime and terrorism have occurred under parallel conditions. These conditions comprise of economic adversity, social stratification, oppressive regimes, weak or limited law enforcement, socioeconomics, and the politics of a particular region.
- Both crime and terrorism allow the marginalised or the subjugated to gain life success by choosing another path that breaks the institutional barriers of entry using innovative, illegal approaches. These methods provide opportunities for ideological wins, financial advantage and vertical movement in a society. .
- Other linkage is through the **spread of fake currency**. Terrorists are the main agent of this currency. Indian mujahidin resorted to crime to raise funds. This includes robberies and kidnapping. Maoists terror movement also uses coercion, robberies of banks and kidnapping to collect huge funds.
- Nexus between organized crime and terrorism increases also due to many factors such as **globalization** in which free flow of trade and human provide opportunity for both to intermingle, communication rebellion through internet, end of cold war that reduce state financing of terrorist therefore terrorist indulge in criminal activities to fill financial needs and lastly, global war on terror.

Conclusion:

In summary, the usual distinction between terrorist and criminal organizations is really a continuum, with purely financial motives at one extreme and purely ideological or political objectives at the other.

“The exponential growth of computer related crime equal with the increasing dependence of computers in our day-to-day lives has posed another tool for terrorists to spread terrorism”. Critically examine the statement in light of recent cyber incidences. (250 words)

The hindu

Reference

Why this question:

The question is straight forward and is about discussing the increasing cyber terrorism incidence across the world.

Key demand of the question:

Explain the rising incidences of cyber terrorism across the world, quote examples and examine the issue in detail.

Directive:

Critically examine – When asked to examine, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Define what is cyber terrorism.

Body:

Explain the rising incidences of cyber crimes and interlinkages of it with terrorism. Discuss the causative factors, analyse the security challenges it poses owing to its invisibleness.

What needs to be done to address the challenge and control the spread of the same.

Conclusion:

Conclude by suggesting solutions and way forward.

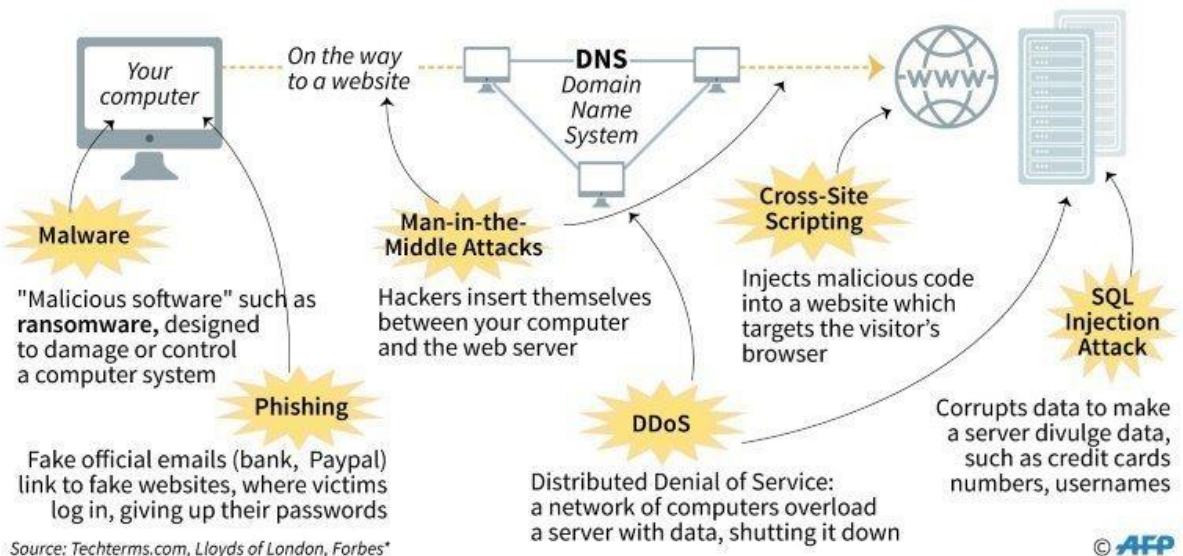

Introduction:

Cyber-attacks have grown in terms of sophistication and reach in the recent times. The countries are witnessing growing cybercrime ranging from fraud calls to malwares that bring banking systems to a standstill. India was one of the worst hit countries by the WannaCry ransomware malware affecting sectors such as banking, finance and manufacturing last year.

Body:

The different types of cyber attacks

Cyber crime worldwide cost \$400 billion in 2015 and is forecast to reach \$2 trillion in 2019*

CYBERATTACKS IN INDIA OF LATE

July 2016

UNION BANK OF INDIA HEIST

Through a phishing email sent to an employee, hackers accessed the credentials to execute a fund transfer, swindling Union Bank of India of \$171 million. Prompt action helped the bank recover almost the entire money

May 2017

WANNACRY RANSOMWARE

The global ransomware attack took its toll in India with several thousand computers getting locked down by ransom-seeking hackers. The attack also impacted systems belonging to the Andhra Pradesh police and state utilities of West Bengal

May 2017

DATA THEFT AT ZOMATO

The food tech company discovered that data, including names, email IDs and hashed passwords, of 17 million users was stolen by an 'ethical' hacker—who demanded the company must acknowledge its security vulnerabilities—and put up for sale on the Dark Web

June 2017

PETYA RANSOMWARE

The ransomware attack made its impact felt across the world, including India, where container handling functions at a terminal operated by the Danish firm AP Moller-Maersk at Mumbai's Jawaharlal Nehru Port Trust got affected

State of cyber security in India:

- According to EY's latest Global Information Security Survey (GISS) 2018-19 – India edition, one of the highest number of cyber threats have been detected in India, and the country ranks second in terms of targeted attacks.
- Although Banking and Telecom are the most attacked sectors but Manufacturing, Healthcare, and Retail have also faced a significant number of cyber attacks.
- India ranks 3rd in terms of the highest number of internet users in the world after USA and China, the number has grown 6-fold between 2012-2017 with a compound annual growth rate of 44%. (NITI Aayog)
- India was ranked among the top five countries to be affected by cybercrime, according to a 22 October report by online security firm "Symantec Corp". India was ranked second globally when it comes to spam and phishing (misleading emails, weblink etc.)

- As per a report by Indian Computer Emergency Response Team (CERT-In), more than 53,000 cyber security incidents took place in India in 2017
- As per the data by NCRB (National Crime Record Bureau), 12317 cases related to cybercrime were registered in 2016.

Need for Cyber Security

- **For Individuals:** Photos, videos and other personal information shared by an individual on social networking sites can be inappropriately used by others, leading to serious and even life-threatening incidents.
- **For Business Organizations:** Companies have a lot of data and information on their systems. A cyber attack may lead to loss of competitive information (such as patents or original work), loss of employees/customers private data resulting into complete loss of public trust on the integrity of the organization.
- **For Government:** A local, state or central government maintains huge amount of confidential data related to country (geographical, military strategic assets etc.) and citizens. Unauthorized access to the data can lead to serious threats on a country.

Way forward:

- Real-time intelligence is required for preventing and containing cyber attacks.
- Periodical 'Backup of Data' is a solution to ransomware.
- Using Artificial Intelligence (AI) for predicting and accurately identifying attacks.
- Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
- Increased awareness about cyber threats for which digital literacy is required first.
- India needs to secure its computing environment and IoT with current tools, patches, updates and best known methods in a timely manner.
- The need of the hour for Indian government is to develop core skills in cyber security, data integrity and data security fields while also setting stringent cyber security standards to protect banks and financial institutions.

Trace the changed security situation in Jammu and Kashmir and discuss the road ahead post the recent landmark political changes. (250 words)

[Livemint](#)

Why this question:

The question is in the backdrop of recent scrapping of article 370 and the effect it has on the security front in Kashmir.

Key demand of the question:

The answer must trace the security situation in Kashmir and in what way the dynamics have been changing around the state.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief upon what were the issues I the past to current.

Body:

Discussion should include the following:

Explain first that the volatile security scenario in J&K is a manifestation of Pakistan's proxy war with India, combined with the unsettled political issues of the state.

Explain the causative factors of challenges on security on various fronts.

Discuss the possible solutions.

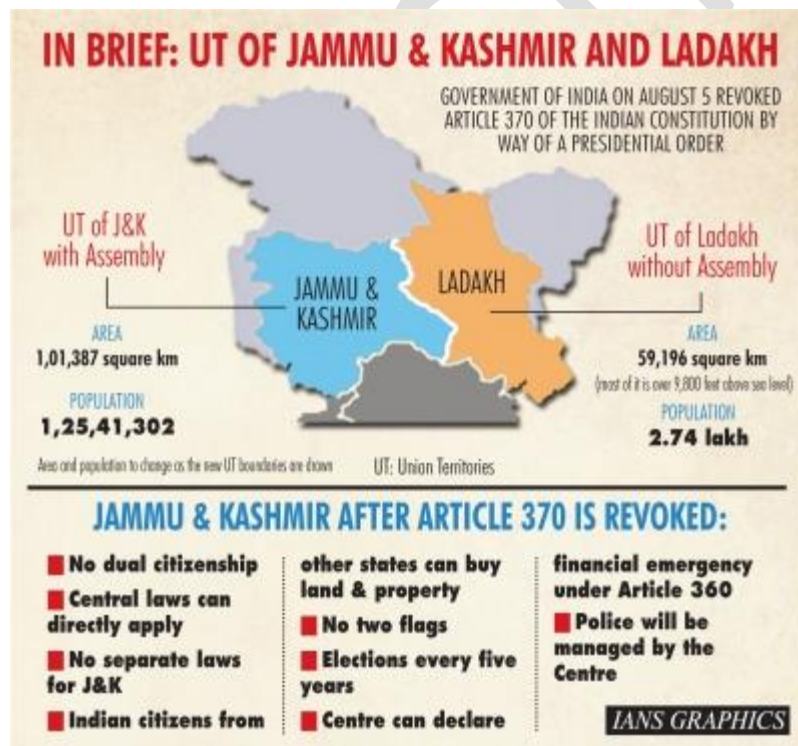

Conclusion:

Conclude with way forward.

Introduction:

The government recently introduced a **resolution to remove provisions of Article 370**, which provides special status to Jammu and Kashmir. In addition, Home Minister also introduced a Bill bifurcating the State of Jammu of Kashmir into Union Territory of Ladakh and the Union Territory of Jammu and Kashmir. The Presidential Order has extended all provisions of the Constitution to Jammu and Kashmir, including the chapter on Fundamental Rights. Therefore, the discriminatory provisions under Article 35A are now unconstitutional.

Body:

Changed security situation in Jammu and Kashmir:

- In effect, the state of Jammu and Kashmir will now cease to exist; it will be replaced by two new Union Territories: Jammu and Kashmir, and Ladakh.
- The UT of Jammu and Kashmir will have an Assembly, like in Delhi and Puducherry.
- The law and order is now under the direct control of Union Government.
- The Government's argument that the continued fragile situation in Kashmir, and the ascendancy of the Taliban and fellow jihadists in Kabul as a fallout of the future US withdrawal from Afghanistan made it necessary to make it a UT.
- National security planners have reviewed how Harkat-ul-Ansar (parent of the Jaish-e-Mohammed) and Lashkar-e-Taiba (LeT) camps had shifted to Khost in eastern Afghanistan under the protection of the then Taliban regime.
- The threat of terrorism in Kashmir could increase just as it did after the Taliban took control of Kabul in 1996, the official added. The rise of the Taliban in the past led to terror attacks by jihadists in Jammu and Kashmir as well as the IC-814 hijacking by the Harkat-ul-Ansar.
- But scrapping 35A has fuelled concerns about whether this is an effort to change the texture of Kashmir, to allow people who weren't part of the permanent resident class in Kashmir to buy land and come in. This could flare up the situation.
- Rejection of the Government move by Pakistan could also lead to further pumping in of state sponsored terrorists to spoil the security situation in JK
- Extremist terrorists may attack vulnerable targets or attack troops as a way of ramping up tensions, forcing the Indian government to respond militarily and creating that spiral of violence that they benefit from.
- The separatists will get a great boost. It gives them a talking point: We've been telling you for all this time that the Indian government doesn't see you as one of them and doesn't respect Kashmiri identity.
- Further, with OBOR running through Kashmir region, it could sour the relations between India and China going forward as India considers it as an intrusion into her sovereignty.

Measures needed:

There is a need for sustained and coordinated efforts of public outreach involving **all the key stakeholders**.

State:

- Non-violent and democratic methods to achieve political aspirations.
- The way out of the deadlock is **to strengthen democracy**.
- **Empowerment of Local Governments** which involves people at the grassroots level.

- Setting aside of the mutual fears of the people of Jammu and of Kashmir and bringing the people of Ladakh into this ambit as well.
- **Socio economic development through various governmental schemes.**
- **Conducting recruitment rallies to employ the youth**, who are in a different state of mind.

Security Forces:

- While the army's **Operation Sadbhavna (a military civic action initiative of 20 years)** has helped in extending marginal outreach, the lack of mass engagement has prevented the development of any perception change and the creation of alternative narratives to counter the propaganda from Pakistan and the separatists.
- **Direct outreach:** conduct of public meetings or "awami sunwais" in the field in areas where the reach of the administration had become marginal. **Example:** Awami Sunwai's of the past.
- Maximum opportunity to the common citizens to **speak, criticise and complain**, so they can realise that there are enough people willing to listen rather than talk down to the common Kashmiri.
- Need to engage the security personnel especially army and CRPF for public outreach and conduct of public meetings and include the politicians and the public officials along with.

Religious heads:

- Involvement of **local clergies** who has substantial hold on the local populace and seek its cooperation in messaging the youth and others on the uniqueness of the Indian system.
- Exploitation of social media, as much as the countering of online propaganda of radicalisation.

Non-State Actors:

- The other major determinant is J&K is the part of Non-State Actors like Separatists, Neighbouring Pakistan and the state sponsored terrorists.
- They have a considerable hold on the people and their opinions.
- Engaging the non-state actors through **interlocutors, Tier-2 diplomacy** should help alleviate the fears and misunderstandings that have cropped up.

Media:

- Media described as the fourth pillar of democracy plays a very vital role.
- They are responsible for reporting of the incidents in a true and unvitiated manner. However, the political patronage and ownership by big media houses has made more one sided views.
- With internet on the surge and ease of access of information at tips, they help in shaping the views and opinions of people.

- Media should be ethical and democratic in its approach. It should spread the message of peace and harmony across people.

Conclusion:

The significant move, in theory, opens up potential opportunities for development-led economic growth in the Union Territories of J&K and Ladakh. Thus, the move is bound to have a significant impact on the demography, culture, and politics of J&K. Whatever its intent in enabling the full integration of Jammu and Kashmir with India, this decision to alter the State's status could have unintended and dangerous consequences.

Various Security forces and agencies and their mandate.

Which forces are responsible for internal security of the country? Discuss their significance in maintaining peace and harmony. (250 words)

IDSAs articles

Why this question:

The question is straightforward and is about discussing the forces that are responsible for maintaining internal security of the country.

Key demand of the question:

The answer must detail upon the forces responsible for internal security of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Begin with brief on need and importance of internal security.

Body:

There are many divisions of Central Armed Police Force, which deal with internal threats – Assam Rifles (AR), Border Security Force (BSF), Central Industrial Security Force (CISF), Central Reserve Police Force (CRPF), Indo Tibetan Border Police (ITBP), National Security Guard (NSG), Sashastra Seema Bal (SSB) etc. discuss the roles played by each of the forces and use case studies wherever possible to justify the answer better.

Conclusion:

Conclude with significance of the forces and need to keep them strengthened.

Introduction:

Internal security is an **act of ensuring and keeping peace within the borders of a nation by maintaining the national law and order and defending its people from internal security threats**. Responsibility to maintain it lies with agencies ranging from police to paramilitary forces, and in demanding circumstances, the military itself.

Body:

Home grown challenges and threats from across international borders have taken different shapes, be it ethnic insurgency, militancy or terrorism that have weakened and damaged the nation.

Central Armed Police Forces: There are many divisions of Central Armed Police Force, which deal with internal threats.

- **Assam Rifles (AR):** The Assam Rifles contribution towards assimilation of the people of the North-East into the national mainstream is truly monumental. They perform many roles including the provision of internal security under the control of the army through the conduct of counter insurgency and border security operations, provision of aid to the civil power in times of emergency, and the provision of communications, medical assistance and education in remote areas.
- **Border Security Force (BSF):** Its operational responsibility is spread over 6385.36 kms. of international border along Indo-Pakistan, Indo-Bangladesh borders. BSF is also deployed on LoC in J&K under operational control of the Army.
- **Central Industrial Security Force (CISF):** Raised in the year 1969, CISF is presently providing security cover to important installations like space and atomic energy establishments, sea ports, airports, coal mines, steel plants, thermal and hydel power plants, oil and petrochemicals installations, heavy industries, defence establishments, security presses, museums and historical monuments. The charter of CISF has been expanded to provide security cover to VIPs as well as to provide technical consultancy services relating to security and fire protection to industries in public and private sectors.
- **Central Reserve Police Force (CRPF):** The Force is presently handling a wide range of duties covering law and order, counter insurgency, anti-militancy and anti terrorism operations. The Force plays a key role in assisting States in maintaining public order and countering subversive activities of militant groups.
- **Indo Tibetan Border Police (ITBP):** ITBP plays an important role in organizing the annual Kailash Mansarovar Yatra besides providing assistance in disaster management in the central and western Himalayan regions. New challenging role that has emerged for ITBP is disaster management as it is the first responder for natural Disaster in Himalayas. ITBP is in the forefront of movement for the preservation of Himalayan environment & ecology.
- **National Security Guard (NSG):** National Security Guard was raised in 1984, following Operation Blue Star and the assassination of Indira Gandhi, “for combating terrorist activities with a view to protect States against internal disturbances”. The primary role of this Force is to combat terrorism in whatever form it may assume in areas where activity of terrorists assumes serious

proportions, and the State Police and other Central Police Forces cannot cope up with the situation.

- **Sashastra Seema Bal (SSB):** As a border guarding force and lead intelligence agency (LIA) for Indo-Nepal border and Indo-Bhutan border. To promote sense of security among the people living in the border area. To prevent trans-border crimes and unauthorized entries into or exit from the territory of India. To prevent smuggling and other illegal activities.

Conclusion:

Keeping a strong vigil on its border is very important for any nation to check any kind of illegal activities or intrusion through them. For India, the task becomes difficult where terrain and climate is very complex across some of its border areas. Focussing on improved technology will help in making the task easier for the security forces and make its borders more secure.

Border Security Force plays a vital role in protecting the sovereignty and integrity of the nation. Comment.(250 words)

Reference

Why this question:

BSF is an important security organization which works in varied terrains ranging from the Thar desert to the Jammu Kashmir and in the swamps of eastern India. It is important to know about the role played by this paramount organization in protecting the sovereignty and integrity of the nation.

Key demand of the question:

Explain in detail the role played by the BSF in protecting the borders in terms of sovereignty and integrity of the nation.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Explain in few lines the origin and genesis of BSF.

Body:

Discuss the wartime and peacetime role of BSF.

Then move onto explaining the role played by the BSF protecting the sovereignty and integrity of India. e.g. discuss its role in 1971 Indo Pak war and Liberation of Bangladesh; discuss the role of BSF in Tackling the Problem of Insurgency in North-Eastern India; Terrorism in Punjab and the Role of BSF (1989-1993); Kashmir Militancy; BSF in Operation Vijay: Kargil, 1999; Left-Wing Extremism etc.

Conclusion:

Conclude by reasserting significance of such forces in maintaining peace and harmony.

Introduction:

Border Security Force (BSF) is a paramilitary force under home ministry responsible for guarding India's land border during peace time and preventing transnational crime. It is a primary border guarding organisation of India and termed as First Line of Defence of Indian Territories. It is the sentinels of Indian borders with Pakistan and Bangladesh. It came into existence on 1st December, 1965.

Body:

BSF currently stands as the world's largest border guarding force with 186 battalions and 2.57 lakh personnel including an expanding air wing, marine wing, artillery regiments, and commando units.

Role played by the BSF:**Peace time:**

- Promote a **sense of security** among the people living in the border areas.
- **Prevent trans border crimes, unauthorized entry into or exit** from the territory of India
- **Prevent smuggling and any other illegal activity.**
- In 2017, Border Security Force (BSF) personnel detected a cross-border tunnel in the forest area of Damala nullah in Jammu's Arnia sub-sector.
- BSF personnel have been performing **Internal Security Duty in Manipur** for the last two years and have been successfully fighting insurgency in those areas.
- During the earthquake in Gujarat in 2001, the BSF was the first to reach out to help the distressed people and during the communal disturbances BSF personnel went all out to restore amity and brotherhood among the people.
- The BSF took over the **erection of the border fencing in Jammu & Kashmir**
- The BSF has been **defending the borders** along with the army and **checking infiltration** on the borders during the current standoff with Pakistan.

War Time:

- Holding ground in less threatened sectors so long as the main attack does not develop in a particular sector
- The BSF units can continue to remain deployed in particular sector even in a war situation to release the Army for offensive tasks. In the event of a major attack developing, which is not within the capacity of the BSF to deal with, the Army can be expected either to reinforce the BSF with Artillery or other support, or relieve the BSF from its role in the particular sector.
- **Protection of vital installations** particularly air-fields against enemy commandoes/para troopers or raids.
- Providing extension to the flanks of main defence line by the holding of strong points in conjunction with other units.
- Limited Aggressive action against paramilitary or irregular forces of the enemy within the overall plan of the Armed Forces.
- Performing special tasks connected with intelligence including raids. These are tasks which might be entrusted to BSF Units by the Army in a war situation according to local necessity. It

would, however, be expected that the state of training and equipment of the particular BSF Units would be kept in view in assessing their adequacy for the tasks.

- Acting as guides in an area of responsibility where routes are known. This is a task which the BSF should be able to perform.
- Maintenance of law and order in enemy territory administered under the control of Army. Normally, ordinary civil police force would be utilised for this task but the BSF could be used to supplement the civil police or to act in lieu thereof in a situation where civil police is not readily available.
- **Provision of escorts.**
- **Guarding of prisoners of war cages**
- **Assistance in control of refugees.** It is the intention to utilise civil police force and armed Home Guards etc. for these tasks but again depending upon local exigencies, the BSF might be entrusted with these tasks.
- **Anti – infiltration duties** in specified area. This is an important responsibility which will have to be performed by security forces. The exact responsibility of the BSF in this matter is still under consideration and separate instructions are expected to be issued.
- During the Kargil conflict in 1999, the BSF remained on the heights of the mountains and defended the integrity of the country with all the might at its command in unison with the Army

Conclusion:

Thus, with a wide set of responsibilities and variety of roles under its belt, BSF helps in maintaining the integrity and security of India.

Discuss the key mandate carried out by Assam rifles. What are the issues and concerns surrounding the dual control of the same? Critically analyse while suggesting solutions to the same. (250 words)

Reference

Why this question:

The question aims to examine the mandate of the security force – Assam rifles, the issues surrounding it.

Key demand of the question:

The answer must discuss the significance of Assam rifles as an internal security force, the issues and concerns involved in it and solutions to tackle the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

Begin with brief intro on genesis of Assam Rifles.

Body:

Discussion should include the following:

Explain the genesis – The Assam Rifles was established in 1835. It is considered as the oldest of all paramilitary forces.

Significance – This force plays a crucial role in North East India, handling counterinsurgency and border security operations. They are also guarding the 1,643 km long Indo-Myanmar border since 2002.

Though it is classified as a Central Armed Police Force, its tactics, training, equipment and operational mandate closely mirror those of the Indian Army. It is headed by an Army officer of the rank of Lieutenant General. It currently reports to the Ministry of Home Affairs.

Discuss the issues involved with respect to dual control and others.

Conclusion:

Conclude with way forward.

Introduction:

Assam Rifles which is also referred to as the **Sentinels of North East** is the **oldest paramilitary force of India**. The unit can trace its lineage back to a paramilitary police force that was formed under the British in 1835 called **Cachar Levy**. There are currently 46 battalions of AR under the **Ministry of Home Affairs**. The noted anthropologist Verrier Elwin once described Assam Rifles as “**friends of the hill people**”.

Body:**Key mandate of Assam Rifles:**

- They perform many roles including the **provision of internal security** under the control of the army through the **conduct of counter insurgency** and **border security operations**.
- Provision of aid to the civilians in times of emergency
- Provision of communications, medical assistance and education in remote areas.
- In times of war they can also be used as a combat force to secure rear areas if needed.
- Since 2002, they are also guarding the 1,643 km long Indo-Myanmar border.

Issues and concerns:

- **Dual control:** Assam Rifles is under the administrative control of the Ministry of Home Affairs (MHA) while the operational control lies with the Ministry of Defence.
- **High Attrition:** The number of Assam Rifles personnel taking up voluntary retirement in the past three years has increased more than six times. This is due to high level of stress and strain caused by continuous deployment in the remote and insurgency-hit Northeast.
- **Separation from family, problems linked to increased number of nuclear family structure, maintaining higher living standards.**
- **Managing multiple households, children education and related lifestyle diseases.**

- They also struggle with poor roads and communication network, problems in food and safe drinking water and lack of proper channel to air their grievances without disclosing their identity to their commanding officers.

Solutions:

- Quick resolution of the issue of control over the force.
- Better facilities for soldiers in terms of food, stay, safety and security devices.
- Use of technology to reduce the casualties caused to the soldiers.
- Timely vacation by efficient planning of utilization of human resource.
- Developing infrastructure to reduce the deployment and reach time in case of exigencies.
- Grievance redressal mechanism to listen to the woes of the soldiers.

Conclusion:

Given that the Assam Rifles has been deployed in the Northeast since its inception, no other forces in India is more experienced or has a better understanding of the ground scenario. This shows the imperative nature of Assam rifles in guarding our north eastern border.

Discuss the critical role played by National Disaster Response Force (NDRF) in providing a specialist response to a threatening disaster situation or disaster in the country.(250 words)

Reference

Why this question:

The recent disasters ranging from earthquakes to floods have necessitated discussion around the role played by NDRF in the country.

Key demand of the question:

Explain the role played by NDRF.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

The National Disaster Response Force (NDRF) is a specialized force constituted “for the purpose of specialist response to a threatening disaster situation or disaster” under the Disaster Management Act, 2005.

Body:

Explain in brief the composition of the NDRF -is a force of 12 battalions, organized on para-military lines, and manned by persons on deputation from the para-military forces of India: three Border Security Force, three Central Reserve Police Force, two Central Industrial Security Force, two Indo-Tibetan Border Police and two Sashastra Seema Bal.

Discuss the functional parameters- The aim of the National Disaster Management Authority is to build a safer and disaster resilient India by developing a holistic, proactive, multi-disaster and technology driven strategy for disaster management.

This has to be achieved through a culture of prevention, mitigation and preparedness to generate a prompt and efficient response at the time of disasters. This national vision inter alia, aims at inculcating a culture of preparedness among all stakeholders.

Quote the recent case studies where it has played crucial role.

Conclusion:

Conclude by reasserting its importance.

Introduction:

The National Disaster Response Force (NDRF) is a specialised force constituted “for the purpose of specialist response to a threatening disaster situation or disaster” under the **Disaster Management Act, 2005**. The “Apex Body for Disaster Management” in India is the **National Disaster Management Authority (NDMA)**. The Chairman of the NDMA is the **Prime Minister**.

Body:

At present, National Disaster Response Force consists of **12 battalions, three each from the BSF and CRPF and two each from CISF, ITBP and SSB**. Each battalion have **18 self-contained specialist search and rescue teams of 45 personnel each including engineers, technicians, electricians, dog squads and medical/paramedics**. The **total strength of each battalion is 1,149**. All the 12 battalions have been equipped and trained to respond natural as well as man-made disasters. Battalions are also trained and equipped for response during chemical, biological, radiological and nuclear (CBRN) emergencies.

Objectives of NDRF:

- To fight all natural disasters including radiological, biological, chemical and nuclear disasters.
- Conduct search and rescue operations in the event of any natural catastrophe.

Role of NDRF:

Pre-disaster:

- Will impart disaster management training to local police, administration, local bodies and other stake holders.
- Will organize community awareness and preparedness programme during familiarization and recce of vulnerable areas in the Area of Responsibility.
- Will impart training to teachers and school children in the management of natural disasters.

During-disaster:

- Pro-active deployment at level-III disaster.
- Provide hi-tech specialist response during search and rescue operations.
- Provide immediate relief with available men and material in the affected areas.

Post-disaster:

- To assist states in recovery and maintenance of normalcy at the areas of disaster.

Conclusion:

Since its inception NDRF has continued to win hearts of millions of countrymen, by demonstrating its expertise and compassion while handling disaster situations. The list of such challenges is long. The practice of “**proactive availability**” of this Force to the States and that of “pre-positioning”, in a threatening disaster situations have immensely helped minimise damage, caused due to natural calamities in the country.

The need for a single-point adviser between the government and the armed forces has been a long-standing demand of the defence establishment. In this context, discuss the challenges and strategic advantages of creating The Chief of Defence Staff post in Indian Army.(250 words)

[The hindu](#)

Introduction:

The Chief of Defence Staff (CDS) is a **high military office that oversees and coordinates the working of the three Services**, and **offers seamless tri-service views and single-point advice to the Executive** (in India’s case, to the Prime Minister) on **long-term defence planning and management**, including **manpower, equipment and strategy**, and above all, “**jointsmanship**” in operations. It shall **provide “effective leadership at the top level”** to the three wings of the armed forces, and to help **improve coordination among them**.

Body:

CDS – the strategic advantages:

- The appointment of the CDS will certainly change the civil-military balance, and, if done correctly, will address some of the grievances of the Armed Forces pertaining to their status vis-à-vis the civil services.
- The underlying rationale for appointing a CDS is to separate management and command of the Armed Forces.
- To take the logic of the CDS to its conclusion, the Armed Forces must be operationally restructured into theatre commands—complete joint war-fighting formations—led by combatant commanders.
- In the years ahead, a combination of climate change, violent non-state actors and volatile politics will increase the demands on the government to deploy military forces beyond the subcontinent.
- Despite a multitude of threats, India’s Armed Forces have very limited capacity to operate overseas. Hence, the need for an expeditionary CDS.
- From a defence policy perspective, the CDS presents us with the opportunity to optimize defence economics and make expenditure more effective.

Challenges of CDS:

- The challenge, however, will be **execution and preventing the political apprehensions, bureaucracy-military and inter-service rivalry from scuttling these reforms.**
- **Human capacity deficit:** Each individual service neither understands modern industrial supply chains or economics of scale, but more importantly because their respective leaderships refuse to rationalise and streamline their services.
- Poor leadership and atrocious supply chains because of a heavily-outdated logistics chain, too many different types of ammunition and equipment to bring about economies of scale and general disinterest in logistics is complicating.
- The problem of mass producing cheap precision munitions is still absent in India.
- The heavily army-centric approach of the Indian military as a whole, ignoring the fact that it is air forces and navies that win modern wars.
- Worse still, while armies themselves have moved towards a less manpower-intensive paradigm, the Indian Army continues to invest heavily in manpower, as for example the ill-fated mountain strike divisions.

Way forward:

- To take the logic of the CDS to its conclusion, the Armed Forces should be operationally restructured into theatre commands
- The late strategic thinker K. Subrahmanyam argued that the army and navy chiefs should first hand over their command to theatre commanders, with the air chief doing so at a later stage.
- Three theatres are straightforward: Northern, Western and Southern to address the threats from China, Pakistan and the Indian Ocean, respectively.
- He envisaged doubling the air force to 60 squadrons by 2030 and placing them under theatre commands.
- The solutions are required at the foreign interaction, educational, and industrial level — not at the top, but at the bottom. This is not a macro problem; it is a severe micro problem.

Conclusion:

Most countries with advanced militaries have such a post, albeit with varying degrees of power and authority. The United States Chairman Joint Chiefs of Staff Committee (CJCS), for example, is extremely powerful, with a legislated mandate and sharply delineated powers. The role of the CDS becomes critical in times of conflict.

SECURE SYNOPSIS

MAINS 2019

GS-III

SEPTEMBER 2019

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

Discuss the current economic slowdown being witnessed by the country. What are the underlying causes and what measures are needed to be taken to bounce back on the right growth trajectory? Explain.

Indianexpress

Why this question:

The article reflects and highlights the current conditions of fall in GDP numbers of the country and brings out in detail the causes and consequences.

Key demand of the question:

Explain the causes of the slowdown of the economy and discuss what measures are to be taken to overcome the issue.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief discuss the current scenario of the economy.

Body:

The latest GDP growth of 5 % is the lowest in six years with the previous low recorded at 4.3 % in March 2013. It is also lower than 5.8 % GDP growth in the March quarter in 2018-19. This is the second straight quarter when the quarterly GDP growth was lower than 6 %. The growth has slowed down in five out of eight sectors, reflecting the widespread weakness in the overall economy.

Explain then the factors responsible for the slowdown – domestic and global.

Discuss what measures must be taken to resolve in short term as well as long term.

Conclusion:

Conclude with way forward.

In economics, a recession is a business cycle contraction when there is a general decline in economic activity. Recessions generally occur when there is a widespread drop in spending. In India there has been recently, a steady decline in the economic momentum in India, and growth expectations for the current year have already fallen from 7.4% to 7%, thus making it important to find the reasons affecting our economic growth.

Underlying causes –

- **shortage of money** - While currency in circulation is not a problem, the money that much of the formal economy uses for transactions, and sees as bank deposits is not finding its way to the market.
- **Lacunae with financial systems** - Our Financial system which converts base money to M3 is not functioning smoothly. When banks give new loans, they “create” money. When the financial system is not functioning effectively, this process of money creation slows down, failing the money multiplier effect. This can be seen in the **failure of banking sectors to extend loans to credit seekers** in the era of **increasing NPAs**.

- Recent **failure of Non-Banking Finance Companies (NBFCs)** which had stepped in to support credit growth has resulted in restricted growth to ensure survival, as a result of which system-wide credit growth has slowed sharply.
- **Govt. Failure to address the issues** - Government has also failed in addressing these issues as there is a general apprehension of running into the risk of another build-up of bad loans.
- There has been a reported **drop in the households' financial savings to GDP ratio in 2017 to 9.4%** highlighting the fact that there aren't enough savings available for both the government and the private sector to be funded adequately, which further impedes the growth.
- There are several other challenges such as **a weak and ailing real-estate market, problems in agriculture, worrying levels of external dependence in India's energy ecosystem, crumbling municipal infrastructure, and stagnating capital flows**, among several others.

Measures required to stunt the slowdown-

- The govt. should **address the growth slowdown concerns**; free up funds for investment and spending by banks, housing finance companies and MSMEs; and importantly, undo some controversial proposals, in the budget and outside it, which were affecting sentiment in the markets and the corporate sector.
- **Promote the ease of doing business** and even the ease of living for ordinary citizens.
- The **issues surrounding auto sector must be addressed** - the accelerated depreciation of 15% (in addition to the existing 15%) for all vehicles acquired till March 31, 2020 and the deferment of the proposed increase in registration fee for new vehicles to June 2020 are positive measures that will boost sentiment and, it is to be hoped, translate into demand.
- Strong **push** to be given for **repo rate linked loan products**.
- Some **welcome initiatives already in effect** – roll-back of the capital gains tax imposed in the budget on foreign portfolio investors, withdrawal of angel tax on start-ups and the promise that non-compliance with corporate social responsibility (CSR) norms will be decriminalised show a government that is willing to listen to feedback from the ground etc.

Thus it is clear that the economy needs to be addressed based on the ideology of reform, perform and transform in totality to overcome the current challenges of slowdown.

Deep Ocean mining for rare minerals still remains an untapped sector in India; in such a context discuss the relevance of project Samudrayaan and its significance.

Livemint

Why this question:

The question intends to examine the prospects of rare minerals from deep ocean and the significance of Samudrayaan.

Key demand of the question:

One should discuss in detail the relevance of Samudrayaan project and potential of deep ocean mining to India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain what rare earth minerals are.

Body:

First state the context – The ‘Samudrayaan’ is a part of the Ministry of Earth Sciences’ pilot project for deep ocean mining for rare minerals. The project proposes to send a submersible vehicle with three persons to a depth of about 6000 meters to carry out deep underwater studies.

Explain what can be the positive consequences of such initiatives, why is it so significant to the Indian economy.

Conclusion:

Conclude with importance of Marine studies and exploration to Indian economy.

Deep sea mining is a mineral retrieval process that takes place on the ocean floor. It is envisaged that 10% of recovery of that large reserve can meet the energy requirement of India for the next 100 years. It has been estimated that 380 million metric tonnes of polymetallic nodules are available at the bottom of the seas in the Central Indian Ocean.

Significance and potential of Deep ocean mining:

- The floor of the world’s seas is scattered with vast beds of black potato-shaped polymetallic nodules comprising copper, nickel, cobalt, manganese, iron and rare earth elements. These natural minerals are key to making modern gadgets, from smartphones and laptops to pacemakers, hybrid cars and solar panels.
- As expanding technology and infrastructure fuel global demand for these resources whose supply is dwindling fast onshore more and more countries are eyeing the ocean. Once thought to be too costly and difficult, industrial-scale sea mining could begin as early as 2019.

Why India needs seabed minerals?

- India is most interested in copper, nickel and cobalt, as it ramps up clean power generation.
- Cobalt, also produced in Democratic Republic of Congo, is used to make batteries that can store energy from renewable sources, including solar and wind.
- These metals are not widely available in India, so they have strategic importance.
- India’s goal is to become self-reliant in the minerals, and it is “not in a race with anybody”.

Relevance of project Samudrayaan –

Samudrayaan is a pilot project of the Ministry of Earth Sciences for deep ocean mining for rare minerals. It proposes to send men into the deep sea in a submersible vehicle for ocean studies. The project is expected to become a reality by 2021-22. The project has been undertaken by the National Institute of Ocean Technology (NIOT). If the ‘Samudrayaan’ project is successful, India will join the league of developed nations in the exploration of minerals from oceans.

Thus India could be the first developing country to undertake such a project and tap the untapped.

Does the pay-out of ₹1.76 lakh crore to the union government damage the credibility of the Reserve Bank of India as an independent central bank? Critically analyse.

[The hindu](#)

**Why this question:**

The question is amidst the recent controversies of payout of ₹1.76 lakh crore to the government by the RBI in accordance with the recommendations of Bimal Jalan committee.

Key demand of the question:

The answer must address as to in what way the move somewhere has made the RBI lose its credibility yet once again.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:**Introduction:**

In brief narrate the recent happenings between RBI and the government.

Body:

Explain What is the issue around RBI payouts this cycle of the year, why and in what way is it different. What is the controversy around the transfer? Explain how RBI earns money in a variety of ways.

Then discuss in what way such move has diluted the powers of RBI.

Conclusion:

Conclude with positives and negatives of the move.

Recently, the Reserve Bank of India (RBI) central board **decided to transfer ₹1.76 lakh crore to the government** (including a sum of ₹52,637 crore from its contingency reserve), a move that is likely to **address the Central government's precarious fiscal situation**.

The transfer amount included the payment of dividend worth ₹1.23 lakh crore, and funds from its reserves, as identified under a **new economic capital framework (ECF) adopted by the RBI board**. The RBI had formed a **committee chaired by former RBI Governor Bimal Jalan to review its ECF** last year.

What is the issue around RBI payouts this cycle of the year?

- The RBI's transfer of funds to the government per se is nothing new. **The amount of funds** being transferred by the central bank to the government **this year is much higher than earlier — 146.8% more than what it had paid out last year**, when it transferred ₹•50,000 crore as dividend.
- The massive payout has **raised concerns** that the **government may be using money from the RBI to meet its urgent spending needs**, thus effectively turning the central bank into a banker for the government. Central banks such as the RBI, however, are supposed to be independent from all forms of government influence.
- In July, the **government amended the Finance Bill** to ensure that the **Securities and Exchange Board of India (SEBI) transferred surplus funds** in its custody over to the government.
- It is a common view that the move to get the RBI to let go of a portion of its accumulated reserve as part of a **wider campaign by the government to strip the powers of various independent regulatory bodies**.

The current relationship between RBI and the Government-

The government **has been criticized** for taking steps since last year **to progressively dilute the powers of the RBI**. The government had tried to convince the central bank to part with more than ₹3 lakh crore from its reserves last year. The **government appointed a committee headed by Mr. Jalan Bimal to overhaul the economic capital framework**.

Impact of the fund transfers-

Negative impacts-

- The primary impact of the fund transfer between the RBI and the Government is **the damage that it does to the credibility of the RBI as an independent central bank**.
- The transfer of surplus reserves to the government is **in effect a forced injection of extra liquidity into the economy**.
- The increased demand to meet the government's fiscal needs will thus **compromise the RBI's ability** to fulfill its primary mandate — **to preserve the value of the rupee by reining in inflation**, by retaining full and final **control over the supply of rupees in the wider economy**.

Positive impacts-

- The government is **expected to achieve its 3% fiscal deficit** target this year with the help of the funds it has received from the RBI.
- The fresh funds will also **help the government to spend more on any fiscal stimulus** plan that it may decide to implement in order to tackle the slowdown in the economy.
- The transfer of money from the vaults of the RBI to fund government spending **will increase the amount of money supply in the economy**, thus exerting an upward pressure on prices.
- The RBI's transfer of surplus funds to the government could thus **effectively turn into a monetary stimulus for the economy** which has been slowing down for several consecutive quarters now.

Government is planning to replace fossil fuel dominated vehicles fleet by electric vehicles till 2030. In this context, discuss the advantages and challenges involved in achieving it.

[downtoearth](https://www.insightsias.com/downtoearth)

Why this question:

The article explains the future of electric cars and the switch over to the non-fossil fuel based industry of automobiles.

Key demand of the question:

One must explain the shift and justify with advantages and also quote the possible challenges that would be faced.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the current policy measure being taken aggressively to switch over to electric cars in India.

Body:

Explain the recent initiatives in this direction first.

Back the initiative with the possible advantages it carries with it.

Explain the issues and concerns involved.

Suggest solutions to address the imbalance that might get created due to this sudden transitional change.

Conclusion:

Conclude with way forward.

To enhance National fuel efficiency, provide affordable and environment friendly transportation India has aimed to achieve 100% electrification of road transport vehicles by 2030. National electric mobility plan 2020 is one step in this direction. It has ambitious target of 6 to 7 billion sales of hybrid and electric vehicle by 2020, FAME India scheme has been launched under this plan to achieve the goal.

Why zero emissions vehicles make sense in India?

India is desperate to curb air pollution, strengthen energy security and mitigate climate impacts. Electric vehicles (EVs) provide these co-benefits. Official estimates show that India with ambitious EVs can save about 64 per cent of energy demand for road transport, 37 per cent of carbon emissions by 2030 and save \$60 billion in diesel and petrol costs by 2030.

An initiative by the NITI Aayog, the Federation of Indian Chambers of Commerce and Industry and Rocky Mountain Institute estimates that with 100 per cent electrification, India can save 20 lakh crore and 1 gigatonne of CO2 emissions.

There are worries that while fully battery-operated electric vehicles have zero tailpipe emissions on road, their life cycle emissions depends on source of power generation—coal being the dirtiest compared to hydro and renewable energy. But life cycle emissions intensity of electric vehicles can reduce substantially with more renewable energy infusion as per India's post-2020 climate action plans. The energy source of electricity can change flexibly if renewable energy expands. About 15 per cent of India's power is from hydro while renewables can expand to meet the target of 175 GW by 2022.

Moreover, centralized energy generation to power vehicles opens up better opportunity for pollution control at the source than decentralised emissions control of numerous tailpipes of combustion engines. Delhi-based non-profit Centre for Science and Environment estimates that if all the vehicles (except trucks) were to run on electricity by 2030, the electricity consumed will be about 110 Terawatt-hour or about 5 per cent of the total electricity demand of India in 2030 as projected by 2017 report of NITI Aayog. Likewise, the European Union estimates that EVs will consume 9-10 per cent of their total electricity demand by 2050, when 80 per cent of vehicles can be electric.

Advantage of 100% electrification

- Fuel security - India's dependence on imported oil will reduce energy demand by transport sector will be 64% less.
- Curbing air pollution - burning of fossil fuels releases poisonous gases like NOx and SOx. 100% electrification dependence on fossil fuel for transportation will be zero

- Reduces health risk - air pollution causes many non-communicable diseases. This can be avoided with the use of electrical vehicles
- Mitigate climate change - electrification will reduce the carbon footprint of transport sector. Hence help in getting to the emission target for mitigating climate change it can reduce CO2 emission by 37%.
- Job creation - use of electrical vehicle will cause new to Enterprise to come up it will create new jobs
- Implementation of self-driving cars - electrical vehicle is best suited for the concept of self-driving Cars.
- Inspiration for budding engineers - electric vehicle is a new dimension in transport sector it has potential to attract innovative minds

Challenges

- The time limit for or achieving the target seems very difficult - according to Society of Indian automobile manufacturer (SIAM) only 40% electric vehicle sale is possible by 2030 hundred percent can be achieved by 2047
- No penetration of public charging infrastructure
- On adoption of electrical vehicles problem of e-waste management may aggravate. Large number of batteries will get defunct every years
- Current market of internal combustion engine vehicle will be affected and cause millions to lose their job
- To make electrical vehicle really environment friendly shift to renewable energy is prerequisite
- The major limitation for battery operated electrical vehicle is speed and mileage. Therefore advancement in battery technology is also required to be done in parallel with the adoption of electrical vehicle.
- Example thermal battery has higher power density than that of lithium ion battery but presently only Lithium ion batteries are being used in electrical vehicles

Conclusion

Present requirement to mitigate climate change SDG 7 SDG 13, UNFCCC demands of deep emission cuts on an unprecedented level. Government of India's target of 100% electrification is in line with that but the target has disruptive effect on current automobile industry. Therefore multipoint approached is required to achieve the goal with complete automobile industry in mind.

India's record in promoting occupational and industrial safety remains weak even with years of robust economic growth. In this context, discuss the key provisions of the Occupational Safety, Health and Working Conditions Code, 2019. To what extent, it deprives the basic rights of workers in Industrial ecosystem?

[The hindu](#)

Occupational safety refers mainly to health safety and welfare of the people at work. Status of occupational safety in India has not been robust in preceding years.

Every year 48000 fatal accidents occur in India. Only 20% working population was covered under any occupational safety regulation. For instance fire crackers Factory at Batle Punjab claimed 23 lives this year; Sivakashi factory explosion - 2012, 40 died and 70 injured.

Reason for weak record in occupational safety

- **High competition in market** - to make more profit Industries tends to do cost cutting which impacts occupational safety at workplace.
- **Large availability of cheap workforce** - due to high unemployment people get ready to compromise on their safety in order to get a job.
- **Lack of coverage** - 90% of the workforce in India is under informal sector and majority of employer in informal sector are not covered under occupational safety regulation.
- **Lack of awareness** - employed tend to ignore operational safety at workplace and concentrate more on completing the target

Therefore to enhance the operational safety in India, government has passed operational safety health and working condition code 2019 which combines 13 different labour laws and regulation regarding operational safety and health at workplace in the country.

What is the Code for?

- A healthy workforce would be more productive and the occurrence of fewer accidents and mishaps at work would be economically beneficial.
- So, safety, health, welfare and improved working conditions are pre-requisite for wellbeing of the worker and the country's economic growth.
- With this in mind, the Code repeals and replaces 13 labour laws relating to safety, health and working conditions.
- These include the Factories Act, 1948, the Mines Act, 1952, and the Contract Labour (Regulation and Abolition) Act, 1970.
- The Code enhances the ambit of provisions from existing about 9 major sectors to all establishments having 10 or more employees.
- It does not apply to apprentices.
- Further, it makes special provisions for certain types of establishments and classes of employees, such as factories, mines, and building and construction workers.

Key Provisions of the Code

- **Relevant authorities** - All establishments covered by the Code must be registered with registering officers.
- **Further**, Inspector-cum-facilitators may inquire into accidents, and conduct inspections of establishments.

- Both these authorities are appointed by the central or state government.
- Additionally, the government may require certain establishments to set up safety committees comprising representatives of employers and workers.
- Advisory Bodies - The central and state governments will set up Occupational Safety and Health Advisory Boards at the national and state level, respectively.
- These Boards will advise the central and state governments on the standards, rules, and regulations to be framed under the Code.
- Duties of employers - The Code specifies several duties of employers which include -
 - providing a workplace that is free from hazards that may cause injury or diseases
 - providing free annual health examinations to employees, as prescribed
- In case of an accident at the workplace that leads to death or serious bodily injury of an employee, the employer must inform the relevant authorities.
- Rights and duties of employees - Duties of employees under the Code include -
 - taking care of their own health and safety
 - complying with the specified safety and health standards
 - reporting unsafe situations to the inspector
- Every employee will have the right to obtain from the employer information related to safety and health standards.
- Working Hours - Work hours for different classes of establishment and employees will be provided as per the rules prescribed by the central or state government.
- For overtime work, the worker must be paid twice the rate of daily wages.
- Female workers, with their consent, may work past 7pm and before 6am, if approved by the central or state government.
- Leave - No employee may work for more than 6 days a week.
- However, exceptions may be provided for motor transport workers.
- Workers must receive paid annual leave for at least one in 20 days of the period spent on duty.
- For sales promotion employees, medical leave must be provided for at least one-eighteenth of the period of service.
- During medical leave, the worker must be paid half his daily wages.
- Working conditions and welfare facilities - The employer is required to provide a hygienic work environment.
- These include ventilation, comfortable temperature and humidity, sufficient space, clean drinking water, and latrine and urinal accommodations.

- Other welfare facilities may be provided as per standards prescribed by the central government.
- These facilities may include separate bathing places and locker rooms for male, female and transgender employees, canteens, first aid boxes, and crèches.
- Offences and penalties - An offence that leads to the death of an employee will be punishable with imprisonment of up to 2 years, or a fine up to Rs. 5 lakh, or both.
- Further, courts may direct that at least 50% of such fine be given as compensation to the heirs of the victim.
- For any other violation where the penalty is not specified, the employer will be penalised with a fine between 2 and 3 lakh rupees.
- If an employee violates provisions of the Code, s/he will be subject to a fine of up to Rs 10,000.

Positives

- It increased the Ambit of application of occupational safety regulations by including migrant workers, electronic media etc. under it.
- It reduced the threshold for its application to 10 workers.
- It enabled employing women in night shifts.
- Rationalize the compliance mechanism with organization now required to obtain only one license.

Negatives

- Formation of safety committee and appointment of safety officer the letter in the case of establishment with 500 employees are at the state's discretion.
- Maximum working hour's fixation is left to government to decide which was earlier fixed at 8 hours a day.
- Maximum permissible limit of working condition at hazardous place is also left at the mercy of government.
- No special provision regarding transgender employees.
- Equal pay for equal work finds no explicit mention.

Way forward

- Maximum working hours and limits for working condition should not be left at the discretion of the government it should be aligned with best International practices.
- Implementation of management information system MIS should be made mandatory for hazardous industries.
- The standards of occupational safety and health should be quantified.
- Time to time inspection by third party should be made necessary so that there is no deviation from safety standards.

Conclusion

With the ultimate aim of extending the safety and healthy working conditions to all workforce of the country, the Code enhances the ambit of provisions of safety, health, welfare and working conditions from existing about 9 major sectors to all establishments having 10 or more employees.

It is evident that the Occupational Safety, Health and Working Conditions has some unique new initiatives for both workers and employers.

It promotes health, safety, welfare and better working conditions of workforce by enhancing the ambit of a dynamic legislation as compared to the existing sectoral approach limited to few sectors.

Besides, it also drastically rationalizes the compliance mechanism with one license, one registration and one return for the establishments under the ambit of the Code thereby saving resources and efforts of the employers.

Thus, it balances the requirements of worker and employer and is beneficial to both the constituents of the world of work.

Government has hiked ethanol procurement price for blending with petrol, allowed conversion of old sugar into ethanol. How is the move expected to address problems of the Sugarcane growers in the country? Discuss.

[Indianexpress](#)

Why this question:

The government approved an increase in the price of ethanol to be procured by public sector oil marketing companies (OMCs) from sugar mills for blending with petrol for the 2019-20. The Cabinet Committee on Economic Affairs (CCEA) also allowed conversion of old sugar into ethanol, which again is expected to help mills deal with the current overproduction in the sweetener and make timely payments to farmers for the cane delivered by them.

Key demand of the question:

The answer should explain the effect of recent initiative taken by the govt. to address the sugar woes of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the recent initiatives taken by the govt. to address the sugarcane woes of the country.

Body:

What is ethanol and how do mills produce it?

How is using ethanol becoming a solution? Given the surplus sugar production in the country, the government has allowed mills to produce ethanol from molasses and directly from sugarcane juice.

Explain that since the country is producing too much sugar and is importing oil, the ethanol-blending programme is beneficial both for mills and for the country's balance of payments.

Conclusion:

Conclude with way ahead.

The **government approved an increase in the price of ethanol** to be procured by public sector oil marketing companies (OMCs) from sugar mills for blending with petrol for the 2019-20. The Cabinet Committee on Economic Affairs (CCEA) also **allowed conversion of old sugar into ethanol**, which

again is expected to help mills deal with the current overproduction in the sweetener and make timely payments to farmers for the cane delivered by them.

What is ethanol and how do mills produce it?

- **Ethanol is basically alcohol of 99%-plus purity**, which can be used for blending with petrol.
- The normal rectified spirit used for potable purposes has only 95% alcohol content.
- Both ethanol (also called anhydrous alcohol) and rectified spirit are produced mainly from molasses, a byproduct of sugar manufacture.
- From **one ton of cane, mills can produce 115 kg of sugar (at 11.5% recovery) and 45 kg of molasses (18 kg TFS) that gives 10.8 litres of ethanol.**
- But rather than produce sugar, **mills can also ferment the entire cane.** In that event, they would end up making 84 litres of ethanol and zero kg of sugar.

How is using ethanol becoming a solution?

- Given the surplus sugar production in the country, the government has allowed **mills to produce ethanol from molasses and directly from sugarcane juice.**
- CCEA approved even **use of sugar and sugar syrup for production of ethanol**; mills can simply add these to the molasses mother liquor for further fermentation.
- Currently, **ex-factory prices of sugar** are ruling at around **Rs 32 per kg.**
- But if it were to convert the entire cane juice into 84 liters of ethanol, **the gross prices will be at around 59.48/litre.**
- This is a huge incentive to produce ethanol. This has been additionally facilitated by the **government mandating 10% blending of petrol with ethanol.**
- If mills are able to **divert more of cane juice for ethanol**, it would mean **producing less sugar.**
- Since the country is **producing too much sugar** and is **importing oil**, the ethanol-blending programme is **beneficial both for mills and for the country's balance of payments.**

Way ahead-

- Mills are expected to close the 2018-19 sugar season (October-September) with **all-time-high stocks of 136 lakh tonnes (lt)**, which is equivalent to **six months of domestic consumption.**
- As of now, the sugar mills **have outstanding cane dues of over Rs 10,000 crore**, of which Rs 7,000 crore-plus is in UP alone.
- These will **mount further as crushing for the 2019-20 season begins** in a month's time.

Ethanol is the only **real savior** under the circumstances — both for mills and cane growers.

What do the bank mergers mean for the banking sector? Explain the connection between bank merger and economic growth of the country.

The hindu

**Why this question:**

Finance Minister Nirmala Sitharaman recently announced that 10 banks owned by the Government of India will be merged into four larger banks; thus the total number of state owned banks in the country will have come down from 27 (in 2017) to 12.

Key demand of the question:

One must explain what are bank mergers, their significance and effect on Indian economy.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

In brief narrate the background of the question.

Body:

Discuss the following aspects in the answer body –

Explain what is a merger and why are so many state owned banks being consolidated.

Discuss the various reasons cited by the government for its decision to merge state owned banks.

Explain the effect such mergers will have on the economy in detail while presenting pros and cons.

Conclusion:

Conclude with significance of such move to the current conditions of the economy.

Government announced mega bank amalgamation plan that merged 10 PSBs into four larger entities. The four new banks are-

- **Punjab National Bank, Oriental Bank of Commerce and United Bank of India** are to merge to form **the country's second-largest lender**. These three banks are technologically compatible as they use Finacle Core Banking Solution platform.
- **Canara Bank and Syndicate Bank** to amalgamate which would render the merged entity the **fourth-largest public sector bank**.
- **Union Bank of India to acquire Andhra Bank and Corporation Bank** which would make the merged entity the **fifth largest public sector bank**.
- **Indian Bank** (Strong presence in South India) is to **merge with Allahabad Bank** (strong presence in East & North India) – To **maximise geographical synergies**.

History of bank mergers-

- **Narasimham Committee of 1998** had proposed a three-tier banking structure for India – Three large banks of international size, eight to 10 national banks and a large number of regional banks.
- Government had merged **Dena Bank and Vijaya Bank with Bank of Baroda on January 2019, creating the third-largest bank** by loans in the country.
- Earlier, **the State Bank of India** had acquired **its associate banks and Bhartiya Mahila Bank**.
- With these series of mergers, the number of state-owned banks is **down to 12 from 27**.

Other reform measures-

- There will be a number of smaller reforms to the boards of the banks that are aimed at improving their efficiency and accountability.
- In order to make the management accountable to the boards of the banks, **a board committee would be made in charge of appraising the performance of officers** of the rank of general managers and above, including the managing director.
- The banks have also been allowed to **recruit chief risk officers from the market**, at market-linked compensation **to attract the best available talent**.
- Other reform measures were aimed at **increasing the engagement of non-official directors**, allowing bank boards to **reduce or rationalize the number of committees**, and increasing the effectiveness of the directors on the Management Committees of Boards by increasing the length of their terms.

How will the mergers help the banking sector?

- The move is aimed at creating a **robust banking system with global reach**.
- The mergers will help **create stronger institutions** thereby leading to **efficiencies of scale** and **stronger balance sheets**.
- It will help **rationalize costs** across many areas including branches, people, technology etc.
- **Customers** should be able to **get better service and better product suite** and the best of all the merged entities.
- **The Banking sector as a whole will get strengthened** due to obvious efficiencies and will lead to **enhanced productivity** and better results thereby leading to better lending too.

Way Forward

- Dual regulation by the Ministry of Finance and RBI on PSBs often results in paralysis in decision making – which makes consolidation of banks a redundant measure if they are not given power to act swiftly, as pointed by PJ Nayak.
- Governance of public banks needs to be improved before making any significant change in any emerging architecture.
- Bigger banks offer more resilience to the banking sector but overlooking bigger red flags like strong credit appraisal and risk control system would do little help in creating robust banks.
- Therefore due focus on ensuring strong foundation of PSBs is important.

While India has had the longest, uninterrupted and most substantial ties with Gulf nations, it also has the highest stake in regional stability because of its energy and economic interests. Analyse.

[Livemint](#)

Why this question:

In the early hours of 14 September, ten unmanned drones from Yemen caused severe damage to Saudi Arabia's oil facilities in the Eastern Province north of Riyadh. The target: the oil processing plant at Abqaiq and the country's second-largest oil field at Khurais. As markets opened on 16 September, oil prices went from \$59 to \$71 per barrel, though they eased later after the US announced it would release its reserves to stabilize prices.

Key demand of the question:

One should discuss the recent happenings and the oil crisis that the world countries are facing.

Directive:

analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Explain in brief the recent happenings of oil explosions.

Body:

Explain that In West Asia, India has an eight million-strong resident community, whose welfare is of paramount importance not only to the Centre but also several state governments.

Take cues from the article and explain the relevance of it to India and then discuss in detail the relevance of India and its role in the stability of the region.

Conclusion:

Conclude with what should be the way ahead.

India's relations with the West Asian countries are historical since the independence. India has interests in economic, political, security and strategic fields with the West Asian nations. For decades, India was a passive player in West Asia-a beneficiary of good relationships with multiple actors. Historically, India's West Asia policy has been multi-directional. During the Cold War years, India maintained close economic cooperation with both Saudi Arabia and Iran, the rival poles in regional geopolitics. In the post-Soviet world: The bi-directional approach has been expanded to a tri-directional foreign policy to accommodate the three key pillars of West Asia — Saudi Arabia, Iran and Israel.

Importance of west Asia for India

India has huge stakes involved in the region such as energy, trade and safety of Indian community in the region.

Energy security: 70 per cent of India's imported energy needs come from West Asia and this dependence will only increase as the Indian economy continues to grow at 8 per cent or more.

Security of Indian community:

- India is the largest recipient of foreign remittances from west Asia.
- 11 million Indians working in West Asia. Therefore, stability in the region is high on India's core agenda.
- To counter radicalization: close cooperation is essential to counter radicalization in India.
- Gate way to central Asia : West Asia is gate way to land locked and energy rich central Asia .
- Geostrategic importance: To reduce the influence of china in west Asia and in Arabian Sea. China is continuously making in road to west Asia through OBOR initiative.

Challenges in west Asia

- **Political instability -**
- The security situation in West Asia has been continuously deteriorating ever since the onset of the Arab Spring in December 2010.

- The internal security situation in Syria, Iraq and Yemen has gone from bad to worse. The regional powers continue to fight proxy wars on sectarian lines, pumping huge amount of money and weapons to bolster their favored groups.
- The involvement of extra-regional players such as the USA and Russia in the internal conflicts in West Asia has further aggravated the situation.
- The GCC-Iran rivalry, Shia-Sunni conflict, external intervention in the region, the fear of rise of religious radicalism etc. have further contributed to instability in West Asia.
- **Terrorism:** Terrorism has emerged as the biggest security threat to the region. The rise of the Islamic State in Iraq and Syria (ISIS) is the most disturbing trend.
- **Saudi-Iran rivalry:** destabilizing West Asia and influencing West Asian geopolitics.
- **Pakistan factor:** Pakistan is very close ally of many west Asian countries especially with GCC.
- **Shia- Sunni divide** may impact internal security of India.
- India's close relation with Israel is another sore point with west Asia.
- India's close relation with Iran may antagonize Saudi Arabia. India has to balance its ties with all three regional power in west Asia-Iran, Israel and Saudi Arabia.

India's "Look West" policy

India adopted look west policy in 2005. However, the policy did not get much attention since 2005. Recent visit of Prime Minister Narendra Modi to number of west Asia countries has the potential to transform our engagement with West Asia.

Change in West Asian strategic thinking

- Several factors have contributed to this fundamental shift in West Asian strategic thinking.
- First, the structural change in the global energy market with West Asian oil and gas increasingly heading to South and East Asian markets rather than to the Trans-Atlantic markets.
- Second, partly as a consequence of this change in flows and partly owing to the fiscal stress faced by the trans-Atlantic economies, West Asia is looking to India and other Asian powers to step in and offer security guarantees to the region. Many GCC states have welcomed defence cooperation agreements with India.
- Third, in the wake of the Arab Spring and the mess in Egypt and Iraq, the Gulf States find India and China to be more reliable interlocutors than many western states.
- Fourth, under pressure from radical and extremist political forces within West Asia, most states in the region have come to value the Indian principle of seeking and securing regional stability as an over-riding principle of regional security.

Indian economy is one of the fastest growing major economies in the world. To sustain the high economic growth of around 8% in the coming decades, energy security is of paramount importance to India. Despite India's efforts to develop its domestic energy capacity, it is dependent on imports for 80% of its oil needs, of which roughly 55% is sourced from the Persian Gulf region and more than

80% of gas supplies. This highlights the need for energy policy cooperation with the resource rich West Asian countries. Consequently, India has adopted a 'Look West' or 'Link West' policy in this regard.

Saudi Arabia is India's second largest source of oil. Iraq is also a major source of Indian energy imports. Further, the energy imports from Iran picked up in the recent past after the easing of sanctions by US. India has also enhanced its bilateral engagement with countries like Oman and UAE and also at institutional level with GCC (Gulf Cooperation Council).

Though countries such as Saudi Arabia, Kuwait, Iran, Iraq and Qatar will continue to be its major suppliers of oil and gas, India is trying to walk the diplomatic tight rope in West Asia by partnering with Israel in its Leviathan natural gas field in the East Mediterranean Sea.

India's energy relation with West Asian countries are intricately related with the Central Asian countries. Thus India has developed Chabahar port in Iran to access the Central Asian energy market. Besides energy infrastructure projects like TAPI gas pipeline and International North South Corridor will have ripple effects on the India's energy engagements with the West Asian Nations.

India's energy policy engagement with the West Asian region is also related to providing maritime security in the region as most of the shipping vessels pass through Persian Gulf and Indian Ocean. Other major powers like China have increased its footprint in the region. Thus India must also take stock of this geopolitical game in order to secure its own energy security.

Analyse the causes of economic slowdown in detail and suggest measures to boost the economy.

Livemint

Why this question:

The article talks about the causes of recent economic slowdown being witnessed by the country.

Key demand of the question:

One should explain the causes of the economic slowdown and what are the necessary measures that need to be taken to overcome the situation.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Start with what is an economic slowdown.

Body:

Explain in detail the following dimensions:

Discuss first what is meant by slowdown in an economy?

What is the problem with Indian economy?

Discuss the structural and cyclical reasons leading to do the current slowdown in the Indian economy.

Suggest what all reforms can be done?

Conclusion:

Conclude with way forward.

Economic growth is measured by an increase in gross domestic product (GDP), which is defined as the combined value of all goods and services produced within a country in a year. Many forces contribute to economic growth. However, there is no single factor that consistently spurs the perfect

or ideal amount of growth needed for an economy. Unfortunately, recessions are a fact of life and can be caused by exogenous factors such as geopolitical and geo-financial events.

Causes for slowing economy:

- One of the reasons of slowing down of growth can be attributed to shortage of money. While currency in circulation is not a problem, the money that much of the formal economy uses for transactions, and see as bank deposits i.e. M3 or broad money and is eight times the hard currency in circulation, is not finding its way to the market.
- Our Financial system which converts base money to M3 is not functioning smoothly. When banks give new loans, they “create” money. When the financial system is not functioning effectively, this process of money creation slows down, and the ratio of M3 to M0 (also called the money multiplier) falls.
- This can be seen in the failure of banking sectors to extend loans to credit seekers in the era of increasing NPAs.
- Recent failure of Non-Banking Finance Companies (NBFCs) which had stepped in to support credit growth has resulted in restricted growth to ensure survival, as a result of which system-wide credit growth has slowed sharply.
- Government has also failed in addressing these issues as there is a general apprehension of running into the risk of another build-up of bad loans.
- There has been a reported drop in the households’ financial savings to GDP ratio in 2017 to 9.4% highlighting the fact that there aren’t enough savings available for both the government and the private sector to be funded adequately, which further impedes the growth.
- There are several other challenges such as a weak and ailing real-estate market, problems in agriculture, worrying levels of external dependence in India’s energy ecosystem, crumbling municipal infrastructure, and stagnating capital flows, among several others.

Curing the ailing growth

- One way of addressing the economic woes is to speed up the privatization of Public Sector Banks as it has been established beyond doubt that there are structural problems with a state-owned banking system.
- Reducing bank interest can also potentially boost the capacity of lenders to extend loans and, in turn, boost growth in the world’s fastest-growing major economy.

Way Forward

India's growth has been impressive in recent years but this is a country whose development is hampered by endemic structural problems. India requires significant investment in infrastructure, manufacturing and agriculture for the rapid growth rates of the last fifteen to twenty years to be sustained. In order to fulfill this it needs to create a robust financial structure that can serve the needs and demands of growing nation.

India's experience with existing free trade agreements has been lukewarm so far, explain the underlying reasons and discuss what should be the way ahead to change this experience into a positive outcome.

Reference

Why this question:

The article critically examines the Indian scenario of Free trade agreements and its effects on India's economy.

Key demand of the question:

India signed a series of Free Trade Agreements (FTA) in Asia that came into force in the 2000s. Across industry and policy-makers, a view has emerged that these FTAs have not served India well, and even actively damaged Indian industry. Thus one has to analyse in detail the aspects of FTAs with respect to Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define what FTAs are.

Body:

Explain in what way the success of an FTA should be judged against its objective of enhancing trade. Discuss the factors responsible for such an effect and also suggest what steps should be taken to ensure better realization of the FTAs.

Conclusion:

Conclude with way forward.

Free trade agreements are a key to creating seamless trading, but there are genuine concerns when India signs up new such pacts because of past experience.

Trade theory has consistently been a strong proponent of free trade of goods, services, capital and labour. However, a growing wave of protectionism has dominated global trade of late. While it is difficult to assess whether this will lead to a significant shift in the global trade paradigm, a review of India's existing free trade agreements (FTAs) before negotiating new ones is necessary.

Review of India's FTAs:

India is a fairly open economy with overall trade (exports plus imports) as a percentage of GDP at around 40%. Its exports have diversified both in terms of markets and products in the past two decades. Indian exports have gradually found their way into new markets and the export sector has moved up the value chain, leading the way with high-value products like industrial machinery, automobiles and car parts, and refined petroleum products.

Indian exports are sensitive to price changes, global demand and supply-side bottlenecks. Estimates suggest that a 1% increase in the country's international relative export price could reduce export volume growth by about 0.9% for all industries, and by about 1.1% for the manufacturing sector. However, global demand operates with a factor slightly above 1.5, suggesting that, given the composition of our export basket, increase in global demand drives India's exports much more than price cuts.

India's exports to FTA countries have not outperformed overall export growth, or exports to rest of the world.

For example, India's trade deficit with Asean (Association of Southeast Asian Nations), South Korea and Japan has doubled to \$24 billion in FY2017 from \$15 billion in FY2011 (with the signing of the respective FTAs) and \$5 billion in FY06.

Also, India's exports are much more responsive to income changes as compared to price changes. So, a tariff reduction or elimination does not boost exports significantly. Utilization rate of regional trade agreements (RTAs) by exporters in India is very low.

Most estimates put it at less than 25%. Lack of information on FTAs, low margins of preference, delays and administrative costs associated with rules of origin, non-tariff measures, are major reasons for under-utilization.

When it comes to the **India-Asean FTA**, there is a deterioration of the quality of trade. Apart from the surge in total trade deficit due to tariff cuts, sector wise trade flows also paint a grim picture.

As per the UN's Harmonised System of Product Classification, products can be grouped into 99 chapters, and further into 21 sections like textiles, chemicals, vegetable products, etc. India has experienced a worsening of trade balance (deficit increased or surplus reduced) for 13 out of 21 sectors.

This also includes value-added sectors like chemicals and allied, plastics and rubber, minerals, leather, textiles, gems and jewellery. Sectors where trade balance has improved include animal products, cement and ceramic, arms and ammunitions. Sectors where trade deficit has worsened account for approximately 75% of India's exports to Asean.

So, there are genuine concerns of trade asymmetry when India signs up new FTAs because of past FTA experience. However, FTAs are instrumental in creating seamless trade blocs that can aid trade and economic growth. Here are some suggestions while going forward with future FTA negotiations.

Way Forward:

Before getting into any multilateral trade deal, India should review its existing FTAs in terms of benefits to various stakeholders like industry and consumers, trade complementarities and changing trade patterns in the past decade. Negotiating bilateral FTAs with countries where trade complementarities and margin of preference is high may benefit India in the long run.

Also, higher compliance costs nullify the benefits of margin of preference. Thus reducing compliance cost and administrative delays is extremely critical to increase utilization rate of FTAs. Proper safety and quality standards should be set to avoid dumping of lower quality hazardous goods into the Indian market.

Conclusion:

Circumvention of rules of origin should be strictly dealt with by the authorities. Well-balanced FTA deals addressing the concerns of all the stakeholders are the need of the hour.

Discuss how the Automobile Industry slump coincides with an overall economic slowdown of the Industrial Sector that has affected almost all segments of the society?

Timesofindia

Why this question:

The state of the Indian economy is at a worrying situation at present. The GDP growth rate has slipped to 5 per cent in the first quarter of Financial Year 2020, the lowest in over six years. The recent collapse of the automobile sector, the rising Non-Performing Assets, the falling demands of the consumers proves the slowing down of the Indian Economy.

Key demand of the question:

Explain in what way the slowdown in the automobile sector has a multiplier effect on the entire economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Comment on the fact that over the past few months, the Automobile Industry is facing a slowdown.

Body:

Explain first the reasons for the slowdown of the overall economy.

Why is there a slowdown in automobile industry? How is it related to Industries and back to all the sectors of the society?

Explain the overall impact on the Industrial Sector due to Slowdown in the Automobile Sector.

Conclusion:

Conclude with suggestions to contain the slowdown and what needs to be done.

The state of the Indian economy is at a **worrying situation** at present. The GDP growth rate has **slipped to 5 per cent** in the first quarter of Financial Year 2020, the **lowest in over six years**.

The recent **collapse of the automobile sector**, the **rising Non-Performing Assets**, the **falling demands of the consumers** proves the slowing down of the Indian Economy.

Over the past few months, the **Automobile Industry is facing a slowdown**. The sale of vehicles across categories in the country slumped badly. The slowing down of the automobile sector resulted in **slowing down of production** as well as **job cuts** in the sector.

Reasons for the slowdown of the Overall Economy:

- Major economic reforms brought about in the recent past like **Demonetization** was brought about in 2016, **GST** was rolled out in July 2017. Just as the effects of these were weaning off the **Infrastructure Leasing & Financial Services triggered** the crisis of Non-Banking Financial sector credit crunch in 2018.
- There is also a **global economic slowdown** that is happening and given the fact that India is a net commodity exporter, there has been a slump in the volumes of exports.
- **Non-Food Inflation** continued to surpass food inflation in the past two years, amounting to income transfer from rural to urban areas.
- The health of real estate sector is also in a bad shape as there is **increasing inventory of unsold properties**.

**Reasons for the slowdown in the Automobile Industry:**

- The primary reason behind the slump in the automobile sector is considered to be the **slowdown of the income growth** and **rising crisis of the Non-Banking Financial Companies (NBFC)**.
- There is a lack of clear migration policy towards **Electric Vehicles (EV)**. This creates confusion among buyers, **deficit monsoon** and **liquidity crunch** in the economy are also contributing towards a reduction in automobile sales.
- There is a **decline in the demand of new vehicles**, which is mainly because of postponement by the consumers in anticipation of an **expected fall in Goods and Service Tax (GST) rates**.
- The consumers also expect that the **transition from Bharat Stage-IV (BS-IV) to BS-VI** may offer to big discounts between January and March 2020.
- There has been significant **growth in pre-owned cars** over the past two years. This shows that the consumer now prefer to invest in a second hand car. This led to **sharp price hikes and fall in the demand** of new vehicles.
- The government increased the official maximum load **carrying capacity of heavy vehicles by 20-25%** with the aim of bringing down logistics costs. This adversely affected the sale of automobiles, particularly commercial vehicles and is believed to have a weightage of 10% in explaining the decline in the auto industry sales.
- Increased availability of **automobile rentals**, **tech-led** disruptions like shared mobility from firms such as Ola and Uber promotes consumers to rent vehicles instead of buying them.

Overall impact on the Industrial Sector due to Slowdown in the Automobile Sector:

- The continuous decline in the sale of automobile has increased the pressure on the manufacturers to **cut down on their costs, and reduce headcounts**.
- The slowdown of the Automobile Sector has resulted in the **laying off of 8-10 lakh contract employees** in recent months in the auto parts sector.
- The permanent employees of the automobile sector are also in a dilemma as there is **not much work in the factories due to poor demand from original equipment manufacturers**. For instance, leading auto parts maker Bosch had to close its factory for five days recently.
- Crisil Ratings has estimated that **tractor makers** would witness 5-7% sales contraction this fiscal. Weak growth in rural income, moderation in rural infrastructure spending, higher channel inventory, and the effect of a high base will lead to de-growth in tractor sales volume.
- The slowdown has resulted in an **8% loss in GST** collection in the first six months of 2019. In order to recover the loss the auto industry will need to grow at a rate of at least 7% in the remaining 6 months of the Financial Year 2020.

Conclusion:

The economic slowdown has affected every section of the society. The slowdown can be contained to some extent by improving credit availability, addressing the pain points in some sectors, and stepping up capital spends.

Fundamental weaknesses in the structure of the economy need to be removed to sustain high growth along with countercyclical policies to boost demand. Explain the role of government in this case.

Indianexpress

Why this question:

The article states that despite the recessionary conditions in the industrialised countries, it may still be possible to pitch for a higher growth in exports. The recent announcements on boosting exports is a recognition of this

Key demand of the question:

Explain in what way fundamental weaknesses in the structure of the economy need to be removed to sustain high growth along with countercyclical policies to boost demand.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief discuss the current economy of the country.

Body:

First using statistics explain the issues marring the economy of the country.

Explain – Several sectors such as automobiles and housing are facing a sharp weakening of demand. And there has been a significant fall in the savings and investment rate. Within household savings, the proportion of savings in financial assets has sharply declined.

Discuss what measures need to be taken to overcome this challenge.

Conclusion:

Conclude with way forward.

India's GDP growth rate slowed down to 5 per cent in Q1 of FY20 and is expected to be around 6 per cent or below in this financial year.

- As former Reserve Bank of India governor Y V Reddy mentioned recently, a combination of cyclical and structural factors have been responsible for the slowdown.
- Global uncertainties have added to the problem.
- In the last few weeks, the government has announced several measures to improve both consumption and investment in different sectors and for the economy as a whole.
- The announcement of reduction in corporate tax rates announced recently may help in reviving the sentiments of the private sector but the tax revenue may also decline and put pressure on fiscal deficit. But, these measures alone may not help in getting higher growth.

Structural issues to be tackled-

- We need to focus on **three structural issues:**
- Physical **infrastructure development,**
- **Raising human capital** and
- **Revival of rural economy** for a long-term growth of 7 to 8 per cent and attaining \$5 trillion economy by 2024.

**Infrastructure Development-**

- Spending on infrastructure will have multiplier effects in the overall economy including stimulating private investment, aggregate demand and jobs.
- Construction sector was an important source of job creation during 2004-05 to 2011-12. This sector has to be revived in order to create growth and employment.
- The government seems to be fast tracking public capex, encouraging public sector enterprises (PSEs) to invest more and trying to clear the pending bills for the corporate sector and MSMEs.
- The announcement of Rs 100 lakh crore over five years for infrastructure by the government is an important measure.
- The Vijay Kelkar committee's recommendation on PPPs would be useful. The private sector's role is equally important.

Raising human capital for higher growth

- Health and education achievements are essential for human capital. Yet the country's progress on both these aspects leaves much to be desired
- The Niti Aayog says that only 2.3 per cent of Indian workers have formal skill training compared to 70 to 80 per cent in other countries.
- Promotion of technology and knowledge economy will add to growth. One can't have a "demographic dividend" for growth with low human capital.
- Women's labour participation rates have been low and declining. Raising women's human capital and participation rates can improve economic growth.
- We may also not achieve high human capital and productivity with 40 per cent of our children suffering from malnutrition.

Revival of rural economy

- 70 per cent of our population lives in rural areas and has stagnant incomes and wages.
- There is a need for revival of the rural economy with infrastructure investment and structural reforms.
- Agricultural marketing reforms should be a priority.
- For better price discovery, agriculture has to go beyond farming and develop value chains comprising farming, wholesaling, warehousing, logistics, processing and retailing.
- Agricultural exports should be promoted with various policies. Similarly, rural infrastructure and water management are other priorities.
- Stimulus and structural reforms can raise farmers' prices and wages and rise in demand for manufacturing and services.

Suggestions:

- Lower GST and local taxes, as high as 28 % . Like for both tobacco and automobiles.

- Boost private investment- Thru international MOUs , like petro net and tellurian.
- Give sops like tax reduction for consumers to have higher disposable income.
- Experiment on small scale other viable options like, tax free income for low income women.
- Giving preference to infrastructure over capital expenditure.
- Taking measures to boost rural demand and unorganized sector which forms 90 % of the workforce.

Recent steps like rolling back of surcharges, merger of banks can give short term gains, but long term requires bringing structural changes.

Inclusive growth and issues arising from it.

Can India Achieve the UN Goal Of Gender Equality By 2030? What are the steps and measures that can be taken on-ground to determine the way forward?

Reference

Why this question:

A report compiled by Equal Measures 2030, found that not a single country is on track to achieve gender equality by 2030; India ranked 95th out of 129 countries. Thus makes it important for us to analyse the UN goal of gender equality by 2030.

Key demand of the question:

One has to elucidate on the progress being made by India on gender equality front. Discuss the challenges and concerns associated while suggesting way forward.

Structure of the answer:

Introduction:

In brief throw light on the UN goal of gender equality by 2030.

Body:

Since gender inequality constitutes one of the history's most persistent and widespread forms of injustice, eliminating it will call for one of history's biggest movements for change. Women and girls continue to suffer discrimination and violence in every part of the world.

Explain the Indian scenario.

Why is gender equality important? Its relationship with development of the country?

UN Goal 5 and India – quote facts and explain the current status of India.

Discuss solutions on this front.

Conclusion:

Conclude with need for holistic and multi-pronged approach.

Gender equality is not only a fundamental human right, but a necessary foundation for a peaceful, prosperous and sustainable world.

A report compiled by Equal Measures 2030, found that not a single country is on track to achieve gender equality by 2030; India ranked 95th out of 129 countries. To achieve gender equality, models and solutions need to create an enabling environment targeting gender inequality, especially gender-based violence (GBV). This creates equal access to opportunities and resources for women and girls in India. Effective programs have put women at the centre of the programming.

The Ministry of Statistics and Programme Implementation noted that 25% of recorded cases under crimes against women are related to sexual assault. Violence functions as a mechanism to maintain existing power inequalities, especially to subjugate women. Gender-based violence (GBV) is founded

in this unequal power-relations between men and women. It prevents women from achieving their full potential. But GBV cannot be attributed to any single factor. Therefore, strategies to prevent gender-based violence must be grounded in programmes and interventions that promote gender equality as the ultimate goal.

India scored 56.2 out of 100 in the study that led to the report, with 100 being absolute gender equality. Our country is not alone in falling short—none of the UN member states is on track to achieve gender equality by 2030. Moving beyond binaries, India has a long way to go in terms of mainstreaming equality for all.

However, there is good news. Different legislative acts enable safety, security and justice such as POSH—which is the Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013, Dowry Prohibition Act, 1961 and more. The role of civil society becomes critical to witness the realization of the goal and subsequently, better ranking in the Gender Index.

What are the steps and measures that can be taken on-ground to determine the way forward?

Only 25.5% of women participate in the workforce compared to 53.3% of males. The approach to achieving gender equality and therefore providing space for girls and women to fulfill their aspirations, requires an ecological framework that promotes gender equality at the heart of every design, be it policy or programme. It needs to address the complex interplay of factors that operate at the individual, relationship, community and greater societal level. Besides, women are not a homogenous group. Intersecting social identities such as sexual orientation, gender identity, caste and socio-economic status render some women even more vulnerable to violence. This necessitates a nuanced and holistic approach to preventing gender-based violence.

The approach can be translated on-ground to create sustained solutions in varied ways:

- Increasing women's economic independence through improving financial literacy, access to financial services and assisting women to develop their employment prospects.
- Working with vulnerable populations to enable the realization of sexual and reproductive health and rights.
- Skill development through life skills education for low-income women equipping them with knowledge, skills and an understanding of their rights and entitlements enabling them to manage their lives better.
- Working on challenging socially constructed gender norms rooted in patriarchy that result in harm to all genders binary and non-binary (LGBTQAI+).
- Improving the prevention of violence and violence response systems through community-based mechanisms and concerted sensitisation mechanisms.
- Supporting the meaningful involvement of women and men affected by gender-based violence in the design and delivery of services and the advocacy and policy response through the provision of technical assistance.

It is essential to not only ensure women and girls are free from violence but that they have the agency, autonomy and self-determination to reach their potential and lead lives they value. But it cannot be done with a single solution.

Factory-based supported programmes like HERrespect, Women in Factories etc., with brands and their supply chain factories focus on the development of a gender-sensitive work environment and robust workplace systems to address women's issues, including sexual harassment and discrimination.

Conclusion:

When we collaborate across the board with every stakeholder to combine different approaches to provide an intelligently designed holistic solution, we arrive at the cusp of a breakthrough, making on-ground implementation smoother and robust.

Ongoing campaigns in the media and concerted efforts at policy and legislature echo the sentiment of pushing through for a gender-equal world. Together, these, along with a plethora of micro approaches and varied collaborations, hold the promise of ecology where women and girls thrive.

Empowering women does not just benefit her as an individual but her entire community. The United Nations states the economic impact of achieving gender equality in India is estimated to be U.S. \$700 billion of added GDP by 2025.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

What is ZBNF? What are the benefits and how is it better than organic farming?

Elucidate.

[The hindubusinessline](#)

Why this question:

The article analyses in detail the effect of ZBNF and the effect of recent promotion of the concept in the annual Budget of the country.

Key demand of the question:

One must discuss the concept of ZBNF in detail and discuss its importance to Indian agriculture system.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define the concept in brief.

Body:

Explain what is ZBNF in detail – It involves the application of nature's principles in farming. It practices no-till, no chemical use in farming. Alongside, dispersal of clay seed balls to propagate plants is done. Explain the key aspects of it.

Discuss the advantages it holds, benefits and in what way it is better than organic farming; with examples/case studies of some successful states.

Conclusion:

Conclude that the dominant paradigm of chemical-based agriculture has failed and regenerative agriculture is the emerging new science.

Zero Budget Natural Farming (ZBNF), which is a set of farming methods, and also a grassroots peasant movement, has spread to various states in India. It has attained wide success in southern

India, especially the southern Indian state of Karnataka where it first evolved. ZBNF inspires a spirit of volunteerism among its peasant farmer members, who are the main protagonists of the movement.

The four pillars of ZBNF:

Microbial culture: It provides nutrients, but most importantly, acts as a catalytic agent that promotes the activity of microorganisms in the soil, as well as increases earthworm activity; During the 48 hour fermentation process, the aerobic and anaerobic bacteria present in the cow dung and urine multiply as they eat up organic ingredients (like pulse flour). A handful of undisturbed soil is also added to the preparation, as inoculate of native species of microbes and organisms. It also helps to prevent fungal and bacterial plant diseases.

Treatment of seeds, seedlings or any planting material: It is effective in protecting young roots from fungus as well as from soil-borne and seed borne diseases that commonly affect plants after the monsoon period.

Mulching: Soil Mulch: This protects topsoil during cultivation and does not destroy it by tilling. It promotes aeration and water retention in the soil. Straw Mulch: Straw material usually refers to the dried biomass waste of previous crops; it can be composed of the dead material of any living being.

Moisture: it is a necessary condition for the roots of the plants.

It is, basically, a natural farming technique that uses biological pesticides instead of chemical-based fertilizers. Farmers use earthworms, cow dung, urine, plants, human excreta and such biological fertilizers for crop protection. Intercropping and Contour Bunds are some of the techniques of ZBNF. It reduces farmers' investment. It also protects the soil from degradation.

ZBNF works not just in agronomic terms, but also brings about a variety of social and economic benefits. ZBNF brings improvements in yield, soil conservation, seed diversity, quality of produce, household food autonomy, income, and health.

Benefits:

- In ZBNF, yields of various cash and food crops have been found to be significantly higher.
- E.g. yields from ZBNF plots were found on average to be 11% higher for cotton than in non-ZBNF plots.
- The yield for Guli ragi (ZBNF) was 40% higher than non-ZBNF.
- Input costs are near zero as no fertilizers and pesticides are used.
- Profits in most areas under ZBNF were from higher yield and lower inputs.
- Model ZBNF farms were able to withstand drought and flooding.
- Notably these are the serious emerging concerns with regard to climate change.
- Planting multiple crops and border crops on same field provides varied income and nutrient sources.
- Overall, there is

- ✓ reduced use of water and electricity
- ✓ improved health of farmers
- ✓ flourishing of local ecosystems and biodiversity
- ✓ no toxic chemical residues in the environment
- ✓ improvements in soil, biodiversity, livelihoods, water
- ✓ climate resilience
- ✓ women's empowerment and nutrition

How is ZBNF better than organic farming?

- Organic agriculture often involves addition of materials required in bulk and has to be purchased.
- These are large amounts of manure, vermicomposting and other materials.
- These turn out to be expensive for most small farm holders.

The programme can have a positive effect on many of the sustainable development goals. As ZBNF is applied in India's various agro-ecological zones, making farmers the innovators is essential. Agricultural scientists in India have to rework their strategy so that farming is in consonance with nature. The dominant paradigm of chemical-based agriculture has failed and regenerative agriculture is the emerging new science.

Discuss the importance of reviving and managing indigenous species and agricultural practices in India.

Reference

Why this question:

The question aims to analyse the importance of reviving and managing indigenous species and agricultural practices in India amidst rising use of HYV seeds, chemical inputs etc. that have been eroding the soil fertility and leading to unsustainable agriculture.

Key demand of the question:

The question is straight forward and aims to analyse the importance of reviving and managing indigenous species and agricultural practices in India.

Directive:

***Discuss** – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.*

Structure of the answer:

Introduction:

In brief quote data suggesting current unsustainable agriculture practices.

Body:

Explain what are the practices available for reviving and managing indigenous species and agricultural practices in India.

Discuss the pros and cons.

List out the benefits ranging from – ecological, socio-economic etc.

Suggest policies by the government in this direction.

Conclusion:

Conclude with way forward.

“Everything else can wait, but not agriculture”- Jawaharlal Nehru, 1947.

Agriculture is the most important enterprise in the world. Agriculture is the process of producing food, feed, fiber and other desired products by the cultivation of plants and the raising of domesticated animals. In a true sense, it is a productive unit where human get the free gifts of nature namely, land, light, air, temperature, rain water, humidity etc. are integrated into a single primary unit indispensable for human beings.

The effect of prolonged and over usage of chemicals in crops production has resulted in human health hazards and pollution of environment and ground water. At present, the issue is whether to continue with the chemical inputs-based intensive technologies or to go back to the traditional environment friendly farming practices like organic farming for sustainable production, income and socio-economic development of the farming community. In this context that biological pesticides are being considered as environmentally safe, selective, biodegradable, economical and renewable alternative for use in organic farming system.

Green Pesticides or ecological pesticides which are believed to be environmentally friendly and thus cause less harm to the eco system and animal health. In agrology, pesticides are evaluated for minimal average environmental effects. Biocides include germicidal, antibiotic, antibacterial, antiviral, antifungal, antiprotozoals and antiparasites. Pesticides typically come in the form of sprays and dusts. Many ecological pesticides are biological pesticides.

Environmental friendly agricultural technologies for food safety appropriate technologies, which do not assault the nature, would have key roles to play in ensuring food security, in improving human health and in rehabilitating and conserving the environment to safeguard the well-being of the posterity. Instead of striving for more “green revolutions” with emphasis on miracle seeds, hard-hitting, synthetic and engineered pesticides and increased use of fertilizers, the future must look to natural ways and processes for augmenting agricultural productivity.

Over the centuries, indigenous peoples have provided a series of ecological and cultural services to humankind. The preservation of traditional forms of farming knowledge and practices help maintain biodiversity, enhance food security, and protect the world’s natural resources.

Different types of Indigenous agricultural practices:

Agroforestry: Agroforestry involves the deliberate maintenance and planting of trees to develop a microclimate that protects crops against extremes. Blending agricultural with forestry techniques, this farming system helps to control temperature, sunlight exposure, and susceptibility to wind, hail, and rain.

Crop Rotations: The principles of crop rotation have been successfully used for thousands of years in agriculture and are still used today. Crop rotation is the practice of growing different crops on the same land so that no bed or plot sees the same crop in successive seasons. It is a practice designed to preserve the productive capacity of the soil, minimize pests and diseases, reduce chemical use, and manage nutrient requirements, all of which help to maximize yield. The practice of crop rotation builds better soil structure and increases the ability to store carbon on farms.

Mixed-/Inter-cropping: Mixed cropping, also known as intercropping is a system of cropping in which farmers sow more than two crops at the same time. By planting multiple crops, farmers can

maximize land use while reducing the risks associated with single crop failure. Intercropping creates biodiversity, which attracts a variety of beneficial and predatory insects to minimize pests and can also increase soil organic matter, fumigate the soil, and suppress weed growth.

Polyculture: Polyculture systems involve growing many plants of different species in the same area, often in a way that imitates nature. By increasing plant biodiversity, Polyculture systems promote diet diversity in local communities, are more adaptable to climate variability and extreme weather events, and are more resilient to pests and diseases. Polycultures are integral to permaculture systems and design and provide many advantages such as better soil quality, less soil erosion, and more stable yields when compared to monoculture systems.

In fact, all development efforts and activities should be within well-defined ecological rules rather than within narrow economic gains. Sustainable agricultural systems must be ecologically sound for long-term food sufficiency, equitable in providing social justice, and ethical in respecting path future generations and other species.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Do you think the government must create a GST-type council for agriculture reforms and realize the implementation of agri-marketing reforms and to transfer agri-input subsidies directly to beneficiaries' accounts through Aadhaar? Discuss.

[Indianexpress](#)

Why this question:

The article highlights agrarian reforms taken forward by the late parliamentarian Sri Arun Jaitley and brings out the need for GST –type council for agriculture reforms in the country.

Key demand of the question:

One must discuss.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate what are agriculture reforms? Why is there a dire need of them in the country.

Body:

Discuss the various agrarian reforms brought in ranging from subsidies to direct cash transfer. Explain in what way agri-policies impact Indian farmers, agriculture, food security, natural resources, especially water and soil, etc.

Discuss that Indian agricultural policies have an inherent consumer bias, and that input subsidies related to fertilisers, power, irrigation, interest subvention, etc do not promote efficiency in their use. Instead, they are creating several environmental problems like groundwater depletion.

Conclusion:

Conclude with way forward.

Agriculture is the backbone of our economy as it contributes ~15% of GDP, 50% population are employed in this sector. But the growth rate is 2.1 % only. In the words of MS Swaminathan "if

agriculture fails everything else fails". According to former finance minister Arun Jaitley - highest pay off from economic reforms after GST is to come from agriculture.

Problems in agriculture sector

The master problem is farmers' are not getting sufficient income from agriculture. This is due to -

- Syncing size of operational land holding and land degradation.
- Market instability.
- Regressive last like essential commodity act and APMC act.
- Very low penetration of Crop Insurance and formal credit to Agricultural sector.
- Agricultural policies have an inheritance consumer bias.

Reforms till date

- Land Reforms abolition of zamindari, land ceiling and land redistribution
- Tenancy law reforms
- Model APMC act by Centre and launch of e National agricultural market
- Announcement of MSP PDS and price stabilization scheme laxing of FDI norms in food processing industries
- Subsidies on agricultural input like fertilizer electricity irrigation etc. (led to unjustified use of groundwater and fertilizers and cost groundwater depletion soil salinization and eutrophication in nearby water bodies).
- Direct Benefit Transfer (DBT) through the Jan Dhan Aadhar Mobile (JAM)
- Pradhan mantri Krishi sinchai Yojana(PMKSY) and Pradhan mantri fasal Bima Yojana(PMFBY).

Why GST type council for agri reform is required?

- Agriculture is a **state subject**, therefore any Reform initiated by Centre must get States not to get implemented and bear fruits (Cooperative federalism is must)
- GST (biggest tax reform since 1947) is the greatest example of **cooperative federalism**
- In GST Council **all the states and the Centre sit together** to take policy decisions for implementation of GST.
- Therefore, **GST like Council** must be created to gain full cooperation of states in implementation of Agricultural reforms like agriculture market reforms and implementation of DBT
- It will create **one national market** for agricultural, minimize subsidy leakage, and improve agricultural efficiency.
- It will **shift policy inclination** from consumer bias towards farmer side.
- Ultimately it will realize **doubling of farmer income** by 2022.

Challenges

- Extra financial burden on state for implementing this

- All state may not have the same level of expertise to go for the reforms like land leasing, together.
- State may be reluctant to part their power with Centre.

Conclusion

Centre must be ready to increase the state share in devolution of sharable tax, in order to convince them to give up some of their autonomy in national interest.

Financing is of critical concern to the Indian agricultural sector. Discuss how providing interest subvention to small and marginal farmers through Direct Benefit Transfer allows them to get access to institutional credit more efficiently.

Financialexpress

Why this question:

The recent studies made by RBI found that while livestock, forestry, and fisheries contributed around 38-42% of agriculture output during 2014-16, this sector got just 6-7% of total agriculture credit; clearly, this is an issue that needs addressing. Thus it is important for us to analyse Why it is good idea to give farmers interest-subvention via DBT.

Key demand of the question:

One has to discuss the pros and cons of Interest subvention to deal with the agrarian crisis plaguing the country and in what way it can be bridged by choosing the DBT route.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define what interest subvention in agriculture financing is.

Body:

Explain the following aspects –

Bring out the Positives: Increase of formal loan system, Increase in financial inclusion, Decrease in interest rates of money-lenders, Decrease in farmers distress due to availability of loan for agriculture on lesser rates of interest etc.

Then explain any negatives – Big farmers gets most of the benefit as scheme do not differentiate b/w small and big farmers, Net loan value is more than the entire agriculture input gives sign of diversion of funds, Though net loan value has increased, farmers income goes down, No substantial increase in production etc.

Conclusion:

Conclude that An income based policy should be used wherein the money is directly transferred to the farmers Aadhaar linked accounts. This will ensure better targeting and plug leakages. A subsidy income package can be designed on a per hectare basis, with higher rates for small landholders. Banks must be quickly compensated to prevent overburdening. Budgetary allocations can be improved.

An average Indian farmer, who has to work on an uneconomic holding', using traditional methods of cultivation and being exposed to the risks of a poor agricultural season is almost always in debt. He is a perennial debtor.

Once the farmer falls into debt due to crop failure or low prices of crops or malpractices of moneylenders he can never come out of it. In fact, large part of the liabilities of farmers is 'ancestral debt'. Thus, along with his landed property, he passes on his debt to the next generation.

There are four main causes of rural indebtedness in India:

- (i) Low earning power of the borrower,
- (ii) Use of loan for unproductive purposes,
- (iii) Very high rate of interest charged by the village moneylender and
- (iv) The manipulation of accounts by the lenders.

In a few cases, the bad habits of the farmers (such as gambling, drinking, etc.) are responsible for his burden of 'unproductive' debt. However, in most cases, the cause of the debt may be some expensive social ceremony which the farmer was perhaps forced to "arrange for fear of a social boycott".

Need for Finance:

- Finance is required by farmers not only for the production and marketing of crops but also to keep a stagnant agricultural economy alive. Most Indian farmers live near the brink of starvation. A bad monsoon, a poor harvest, an accident or illness in the family forces him to approach the moneylender for a loan. In India, there is the prevalence of such 'distress' or unproductive loans. Agricultural finance in India is not just one requirement of the agricultural business but a symptom of the distress prevailing among the majority of the farmers.
- Rural credit includes not only credit provided to farmers but also credit extended to artisans, owners of small and medium industries in rural areas, small transport operators and so on. Two main sources of rural credit are private and institutional. The former includes private moneylenders, traders and commission agencies, relatives and landlords.
- The sources of institutional credit are rural co-operatives, commercial banks, particularly the State Bank of India (SBI). And, with the setting up of a specialized institution called the National Bank for Agricultural and Rural Development (NABARD) the Agricultural Refinance and Development Corporation (ARDC) has ceased to exist. Up to 1982 it was responsible for extending agricultural finance under guidance of the Reserve Bank of India.
- It may also be noted that the short- and medium-term credit requirements of the farmers is met by indigenous bankers or village moneylenders, co-operative credit societies and commercial banks. Long-term credit needs are met by land development banks and NABARD.
- The principal aim of institutional credit is to replace the widely prevalent money-lending at a very high rate of interest. Available data show that the rural credit institutions have succeeded to a considerable extent in achieving this aim.

Salient features and benefits of Interest subvention scheme:

- The objective of the scheme is to make available agricultural credit for Short Term crop loans at an affordable rate. The scheme is expected to boost agricultural productivity and production in

the country. Under this scheme, farmers will be given a short term crop loan up to Rs. 3 lakh payable within one year at an interest rate of 4% per annum.

- The scheme will be continued for 1 year and will be implemented by NABARD and RBI. The interest subvention will be provided to Public Sector Banks (PSBs), private Sector Banks, Cooperative Banks and Regional Rural Banks (RRBs) and to NABARD for refinancing to RRBs and Cooperative Banks.
- Interest subvention of 5% per annum will be provided to those farmers who pay the short term crop loan in time. Farmers will have to electively pay only 4% as interest. For farmers who do not pay crop loan in time the interest subvention of only 2% will be applicable as against 5% available above.
- This institutional credit is expected to demotivate farmers from taking loans from non-institutional sources of credit at high rates of interest.

Examine the role of “reducing food loss and waste” in achieving sustainable development goals. Also, discuss the role of women in reducing food loss and waste and suggest different approaches to the same.

Reference

Why this question:

The question aims to ascertain the role of “reducing food loss and waste” in achieving sustainable development goals. And key role played by women in addressing the same.

Key demand of the question:

One must explain in detail the role of women in managing the global food losses and wastes and in what way it is necessary to achieve SDGs.

Directive:

Examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

In brief describe the Food Loss and Waste that is occurring globally.

Body:

Explain how “reducing food loss and waste” performs against the sustainable food future criteria.

State the possible approaches to save the food that can be taken.

Discuss the role of women in reducing food loss and waste.

Conclusion:

Conclude that a “war on waste” has yet to be waged when it comes to food. Given that food prices recently hit historic highs and global food demand continues to rise, now is the time.

“Food loss and waste” refers to the edible parts of plants and animals that are produced or harvested for human consumption but that are not ultimately consumed by people. “Food loss” refers to food that spills, spoils, incurs an abnormal reduction in quality such as bruising or wilting, or otherwise gets lost before it reaches the consumer.

Food loss is the unintended result of an agricultural process or technical limitation in storage, infrastructure, packaging, or marketing.

“**Food waste**” refers to food that is of good quality and fit for human consumption but that does not get consumed because it is discarded—either before or after it spoils. Food waste is the result of negligence or a conscious decision to throw food away.

**Key facts:**

- Significant amounts of food are lost or wasted every day, in every country, and at every stage in the supply chain, from the farm to household.
- According to an estimate by the Food and Agriculture Organization of the United Nations (FAO), about one-third of food produced is lost or wasted globally, which is approximately 1.3 billion tones.
- One out of every four food calories intended for people is not ultimately consumed by them.
- Costs aside, food loss has significant impacts on food security, environmental conservation, and climate change.
- It is estimated that saving one-fourth of the food currently lost or wasted globally would be enough to feed 870 million hungry people in the world, of which the highest number are in India.
- How “Reducing Food Loss and Waste” will play a crucial role in achieving sustainable development goals across the globe.

Possible Approaches to save the food:

- **Food redistribution:** Food redistribution or donation programs are a method for reducing both food loss and waste. As used here, “food redistribution” means voluntarily giving away food that otherwise would be lost or wasted to recipients such as food banks, which then redistribute the food to those who need it.
- **Evaporative coolers:** Evaporative coolers extend the shelf life of food and avoid spoilage by keeping food at lower-than-room temperatures without having to use electricity. This low-cost, low-energy technique provides an opportunity to store perishable foods longer in areas that lack electricity infrastructure or that has low-income farmers.
- **Plastic storage bags:** Damage from pests is a major source of food loss during the handling and storage phase of the supply chain. Take cowpeas for instance. The crop is important for many smallholder farmers due to the cowpeas’ ability to adapt to dry, hot conditions.
- **Small metal silos:** Small metal silos, which are intended for use by one farmer or by one household and generally hold between 250–1000 kg of crops, can be an effective strategy for reducing food loss at the storage stage, especially for cereals and pulses. Insufficient storage is a major source of food loss for farmers, especially in developing countries, where storage structures often do not keep harvested crops in hermetic or airtight conditions.
- **Plastic crates:** Using plastic crates instead of other forms of containerization has demonstrated significant reductions in food losses during handling and storage, particularly among fruits, vegetables, and other forms of fresh produce. In developing countries, 19 percent of fruit and vegetable loss occurs in the handling and storage stage of the food value chain.
- **Food date labelling:** Dates provided on the packaging of food and drinks, such as “use-by,” “sell-by,” and “best before,” is intended to provide consumers with information regarding the freshness and safety of foods. However, these seemingly simple dates can actually confuse

consumers about how long it is safe for them to store food and when they should dispose of uneaten items.

- **Consumer awareness campaigns:** Consumer attitudes and behavior play a large role in determining the amount of food that is wasted in households. Although changing the way people consume and throw out food can be difficult, communication campaigns can help influence consumer behavior at the household level.
- **Reduced portion sizes:** For restaurants and other food service providers, food portion sizes can dictate the amount of food waste that occurs within the four walls of their business, since larger portions increase the likelihood that a consumer will not consume all of the food purchased. Reducing portion sizes for consumers in both direct and indirect ways can both decrease food waste and save money for food providers.

The Role of Women in Reducing Food Loss and Waste:

- Women in both developing and developed countries have an important role to play in reducing food loss and waste, since women interact with food at each stage of the value chain from farm to fork.
- Close to the farm, women comprise 41 percent of the agricultural workforce worldwide and make up the majority of agricultural workers in South Asia and Sub-Saharan Africa.
- Close to the fork, surveys in a wide range of countries show that women are responsible for 85-90 percent of the time spent on household food preparation. Therefore, targeting women in food loss and food waste reduction campaigns could result in greater reductions than pursuing an unfocused campaign.
- One such gender-targeted initiative in Tanzania focused on providing female farmers with greater access to markets and supplied participants with access to solar drying technology that allowed for surplus fruits that might otherwise be lost to be dried and preserved.
- Another campaign in Australia called “1 Million Women” encourages women to take action on a number of environmental issues, including reducing food waste. The campaign has hosted events with a celebrity chef to raise awareness of food waste, and its official website provides tips on how to reduce waste and recipes for how to efficiently use food.

Conclusion

An amazing 24 percent of all food calories grown today are lost or wasted between the farm and the fork. This fact is ultimately a failure of economic and natural resource efficiency. The world faced an analogous failure of efficiency in the 1970s with energy. In the face of record oil prices and growing demand, the world essentially declared war on energy wastefulness and significantly improved its energy efficiency.

Yet a “war on waste” has yet to be waged when it comes to food. Given that food prices recently hit historic highs and global food demand continues to rise, now is the time.

Write a note on Participatory Guarantee Scheme. Explain in what way it incentivises farmers to grow organic food along with the advantages and limitations of the scheme.

[Indianexpress](#)

**Why this question:**

Recently The head of India's food safety regulator stated that the Union Agriculture Ministry's Participatory Guarantee Scheme (PGS) is expected to incentivise more farmers to grow organic food.

Key demand of the question:

One must discuss in detail the key features of Participatory Guarantee Scheme. Explain in what way it incentivises farmers to grow organic food along with the advantages and limitations of the scheme.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

In brief explain why the scheme was put in place.

Body:

Union Agriculture Ministry's PGS is a process of certifying organic products, which ensures that their production takes place in accordance with laid-down quality standards.

Discuss the salient features of the scheme.

Explain what are the associated benefits to it, especially for farmers to grow organic food.

Discuss the advantages of PGS and limitations.

Conclusion:

Conclude with way forward.

Participatory Guarantee Scheme is a process of certifying organic products, which ensures that their production takes place in accordance with laid-down quality standards. The certification is in the form of a documented logo or a statement. PGS is an internationally applicable organic quality assurance initiative that emphasizes the participation of stakeholders, including producers and consumers, and operates outside the framework of third-party certification. PGSs are "locally focused quality assurance systems" that "certify producers based on active participation of stakeholders and are built on a foundation of trust, social networks and knowledge exchange".

PGS, according to the definition, is "a process in which people in similar situations (in this case small holder producers) assess, inspect and verify the production practices of each other and take decisions on organic certification".

Four pillars of PGS

The government's 2015 PGS manual underlines that the system in India is based on "participatory approach, a shared vision, transparency and trust".

PARTICIPATION

Stakeholders such as producers, consumers, retailers, traders, NGOs, Gram Panchayats, and government organizations and agencies are collectively responsible for designing, operating, and decision-making.

Direct communication among the stakeholders helps create an integrity- and trust-based approach with transparency in decision-making, easy access to databases and, where possible, visits to farms by consumers.

SHARED VISION

Collective responsibility for implementation and decision making is driven by a common shared vision.

Each stakeholder organization or PGS group can adopt its own vision conforming to the overall vision and standards of the PGS-India programme.

TRANSPARENCY

At the grassroots level, transparency is maintained through the active participation of producers in the organic guarantee process.

It can include information-sharing at meetings and workshops, peer reviews, and involvement in decision making.

TRUST

A fundamental premise of PGS is the idea that producers can be trusted, and that the organic guarantee system can be an expression and verification of this trust.

The mechanisms for trustworthiness include a producer pledge made through a witnessed signing of a declaration, and written collective undertakings by the group to abide by the norms, principles and standards of PGS.

Advantages of PGS

- Among the advantages of PGS over third-party certification, identified by the government document, are:
- Procedures are simple, documents are basic, and farmers understand the local language used.
- All members live close to each other and are known to each other. As practicing organic farmers themselves, they understand the processes well.
- Because peer appraisers live in the same village, they have better access to surveillance; peer appraisal instead of third-party inspections also reduces costs
- Mutual recognition and support between regional PGS groups ensures better networking for processing and marketing.
- Unlike the grower group certification system, PGS offers every farmer individual certificates, and the farmer is free to market his own produce independent of the group.

Limitations

- PGS certification is only for farmers or communities that can organise and perform as a group within a village or a cluster of continuous villages.
- It is applicable only to farm activities such as crop production, processing, and livestock rearing, and off-farm processing “by PGS farmers of their direct products”.
- Individual farmers or group of farmers smaller than five members are not covered under PGS.
- They either have to opt for third party certification or join the existing PGS local group.

PGS ensures traceability until the product is in the custody of the PGS group, which makes PGS ideal for local direct sales and direct trade between producers and consumers.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

Discuss the challenges and opportunities in India's domestic civil aviation sector by bringing out the recent policy interventions.

Financialexpress

Why this question:

The question aims to comment upon the challenges and the opportunities of the domestic aviation sector in the country.

Key demand of the question:

Explain the challenges and opportunities in India's domestic civil aviation sector by bringing out the recent policy interventions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Introduce by mentioning about the current situation of civil aviation sector in India.

Body:

Explain the aspects of – the opportunities and challenges faced by the sector.

Importance of aviation sector and the need to provide policy support to the sector.

Discuss in depth the policies and various initiatives that are in place to harness the potential of aviation sector such as UDAN, Nabh Nirman etc.

Conclusion:

Conclude with way forward.

Despite the fact that the Indian civil aviation industry is currently considered the third largest domestic civil aviation market in the world, the industry is suffering from several problems.

India's passenger traffic grew at 16.52 per cent year on year to reach 308.75 million (12.72 per cent). Domestic passenger traffic grew around 18.28 per cent to reach 243 million in 2018-19 and is expected to become 293 million in 2020. When it comes to International passengers, it grew by 10.43 per cent to reach 65 million in 2018 and traffic is expected to become 76 million in 2020. In 2018-19, domestic freight traffic stood at 1,213.06 million tonnes, while international freight traffic was at 2,143.97 million tonnes. India's domestic and international aircraft movements grew 14.40 per cent and 9.40 per cent to 1,886.63 thousand and 437.93 thousand during 2017-18. Number of commercial aircraft in India is around 550.

Problems of aviation sector:

- The **rupee depreciation** is hitting carriers hard. About 25-30% of their costs, excluding fuel, are dollar denominated—from aircraft lease rents and maintenance costs to ground handling and parking charges abroad.
- **Aviation turbine fuel (ATF)** prices constitute about 40% of costs for an Indian carrier and are taxed higher here than anywhere else in the world. The Centre charges 14% excise duty on ATF. The states pile on their own sales tax that can go as high as 29%.

- The **intense competition among domestic carriers**, the need to capture a slice of the ever expanding market and passenger price sensitivity makes the airlines difficult to raise ticket prices.
- The new civil aviation policy (NCAP) 2016's regional connectivity scheme doesn't help. The ticket price caps it imposes under the scheme, the fact that the viability gap funding will last only for three years and various operational issues such as the lack of slots for connecting flights at major airports are a hindrance.
- Rules such as **route dispersal guidelines (RDG)** that mandate airlines to fly a certain percentage of flights in smaller, unprofitable air routes is archaic in nature.
- The projected growth in capacity, because of plane orders, will lead to a 14% shortfall in commander pilots, a part of which will have to be fulfilled by more expensive expatriates, leading to a rise in the wage bill, the second biggest cost chunk after fuel.

Government Initiatives

- Allocation to Civil Aviation Ministry has been increased to Rs 6,602.86 crore (US\$ 1,019.9 million) under Union Budget 2018-19.
- The government has launched the construction of Navi Mumbai airport which is expected to be built at a cost of US\$ 2.58 billion. The first phase of the airport will be completed by the end of 2019.
- The Government of Andhra Pradesh is planning to develop Greenfield airports in six cities- Nizamabad, Nellore, Kurnool, Ramagundam, Tadepalligudem and Kothagudem under the PPP model. Rs 15,000 crore (US \$ 2.32 billion) will be invested in 2018-19 for expanding existing terminals and constructing 15 new ones.
- Presently India has 5 PPP airports each at Mumbai, Delhi, Cochin, Hyderabad and Bengaluru, which together handle over 55 per cent of country's air traffic.
- Government of India has approved 15 Greenfield PPP projects which are expected to increase the air traffic in India. These projects would be setup in Goa, Navi Mumbai, Maharashtra, Bijapur, Gulbarga, Karnataka, Kerala, West Bengal, Madhya Pradesh, Sikkim, Puducherry and Uttar Pradesh.
- National Civil Aviation Policy, 2016 (NCAP, 2016): The policy focuses on creating safe, secure, affordable and sustainable air travel that can be accessed by the masses across India.

Way Forward:

- As Indian aviation market continues to surge, focus should be ensuring adequate airport infrastructure capacity.
- The Air Navigation Services (ANS) unit of the AAI operates communication, navigation, surveillance and traffic management systems for aircraft operating in Indian airspace. With ever increasing busy airspace, it is of paramount importance to ensure that ANS can continue to provide aviation safety.

- The MRO industry in India holds great potential. It is important to ensure that the industry is regulated properly, and that the required skills are developed to service increasingly sophisticated aircraft
- More transparent ATF regime should be ensured where oil marketing companies are required to declare costs and methods used to price the end product.
- Excessive concentration of power in the DGCA should be checked to ensure proper competition and economic viability of the sector.

Conclusion

India's aviation industry has a huge potential and offers huge growth opportunities. One of the key factors which favour such an expectation is that 40 per cent of the upwardly mobile middle class are starting to prefer air travel as the perfect mode of transport. So government must engage and collaborate with industry stakeholders to implement efficient and rational decisions that would enable the growth of India's civil aviation industry. With the right kind of infrastructure and policies with thorough focus on quality, cost and passenger interest, India would surely achieve the third-largest aviation market by 2025.

Debate on the challenges faced by the renewable energy sector in India while discussing the achievements so far. Also discuss what measures must be taken by the government to upscale India's renewable energy ambition.

[Indianexpress](https://www.indianexpress.com)

Why this question:

Recently, at the Global Climate Action Summit in New York, Prime Minister Narendra Modi, made several announcements that underscored India's commitment towards addressing pressing environmental challenges. He talked about his government's plans to curb plastic use and invited countries to join the Coalition For Disaster Resilient Infrastructure.

Key demand of the question:

One must discuss the renewable energy scenario of India, challenges faced by the renewable energy sector in India while discussing the achievements made till date along with suggestions as to how should the country proceed on this front.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief quote statistics on the renewable energy scenario of the country.

Body:

First explain that Increasing the share of non-fossil fuels in the country's energy mix is the bedrock of India's commitments under the Paris Climate Pact. The country pledged an installed electricity capacity of 175 GW by 2022 — a more than five-fold capacity increase in seven years. In the last four years, India has more than doubled its RE capacity.

Discuss the challenges associated and achievements made so far.

Conclusion:

Conclude with what should be our next step.

India imports 80 percent of its oil needs and is the third largest oil consumer in the entire world. India's energy consumption is expected to grow 4.5 percent every year for the next 25 years.

Recently due to high International Crude Oil Prices, Current Account Deficit (CAD) inflated because of higher cost of oil import, raising concerns about long term economic stability in India, highlighting importance of energy security. On account of rising CAD, Indian Rupee touched its lowest.

Challenges for India's Energy Security

Policy Challenges:

Failure to attract international investment in domestic hydrocarbon exploration e.g. NELP failed to attract interest of large international energy corporations.

Major investments will have to be made to acquire hydrocarbon reserves abroad.

Coal mining in India suffers from delays due to regulatory and environmental clearances.

Indo-US nuclear helped fuel domestic power plants and give India access to critical technologies in strategic areas but deal did not lead to India setting up foreign-built reactors.

Accessibility Challenge:

The household sector is one of the largest consumers of energy in India. It is responsible for about 45% of the total primary energy use. In rural areas, biomass accounts for 90% of total primary fuel consumption for cooking. This has serious health impacts on the rural people.

Presently, 304 million Indians do not have access to electricity and around 500 million Indians are dependent on solid biomass for cooking.

Infrastructure and skill related challenges:

Lack of skilled manpower and poorly developed infrastructure for developing conventional and unconventional energy is the need of hour. India lacks transportation infrastructure for making energy accessible e.g. pipelines can be a useful way to boost the total supply of gas in the country. Gas will play a major role in Indian energy mix because it can be used effectively in several demand sectors.

Economic challenges:

Coal, oil and natural gas are the most important sources of primary energy in India. Inadequate domestic supplies of these hydrocarbons are forcing the country to increase its import bill. Rising fuel subsidies, rising CAD creates difficult conditions for economy.

External Challenges:

India's fragile energy security is under severe pressure from its rising dependence on imported oil, regulatory uncertainty, international monopolies and opaque natural gas pricing policies

India seeks to achieve its energy security through multiple partners e.g. Indo-USA nuclear deal, Oil import from Middle East etc. However, in recent times due to conflict among India's energy partners e.g. USA and Iran; India had to reduce oil import from Iran.

In wake of its difficult geographic location in South-Asia, India faces strategic challenge to meet its energy needs.

China's One Belt One Road initiative can give China definitive advantage if any conflict ensues between countries, by disturbing India's access to energy. Failure to get onboard all interested parties in IPI (Iran-Pakistan-India) gas pipeline and TAPI (Turkmenistan, Afghanistan, Pakistan and India) gas pipeline for assured supply of natural gas.

Measures to enhance energy security

Increasing accessibility to clean energy:

- India has already committed to bring electricity to every household by 2022. An even more ambitious goal would be to provide electricity to all households on 24x7 basis.
- To bring clean fuel in rural areas the Pradhan Mantri Ujjawala Yojana, should be complemented by: Setting up of biomass pelletising units; and distribution of 'efficient biomass chullahs'.
- On the agricultural front, solar irrigation pump distribution target must be stepped up and financed through credit support from NABARD and government subsidy.
- The potential non-conventional energy sources must be explored and researched to make them technologically economical and accessible, like geothermal energy, tidal energy etc.

Enhancing efficiency:

The National Mission for Enhanced Energy Efficiency (NMEEE) should conduct a thorough cost-benefit analysis of the available energy-efficient technologies and products across all sectors, especially agriculture, housing and transportation.

At the institutional level, the national and state designated agencies working in the area of energy efficiency should be strengthened.

To enhance vehicle fuel efficiency gains, the auto fuel quality should be upgraded to BS VI norms for nation-wide launch in 2020.

Policy changes:

Around three-quarters of our power comes from coal powered plants. It is important that India increases its domestic coal to reduce its dependence on imports. There is need to fast track the regulatory clearances, improve labour productivity, increase coal production and enhance efficiency of distribution.

Hydrocarbon Exploration and Licensing Policy (HELP) intends to minimize government's discretion in decision making, reduce disputes, reduce administrative delays and introduce concept of revenue sharing, freedom of marketing to stimulate growth in the oil and gas sector in India.

The tax structure should be rationalized in import and sale of energy on thermal value basis with a view to enhance the competitiveness of the economy.

The India energy security scenarios, 2047(IESS) has been developed as an energy scenario building tool. The guiding ambition of this is to develop energy pathways leading up to the year 2047, comprising of likely energy demand and supply scenarios.

NITI Aayog launched the India Energy Security Scenarios 2047 calculator (IESS 2047), as an open source web based tool.

The tool aims to explore a range of potential future energy scenarios for India, for diverse energy demand and supply sectors leading up to 2047.

It explores India's possible energy scenarios across energy supply sectors such as solar, wind, bio fuels, oil, gas, coal and nuclear and energy demand sectors such as transport, industry, agriculture, cooking and lighting appliances. The model allows users to interactively make energy choices, and explore a range of outcomes for the country-from carbon dioxide emissions and import dependence to land use.

Infrastructure:

Refining and distribution of oil and gas needs augmentation. Thus, India should sustain its export capacity of refined products by setting up new refineries.

At present, 31 companies are developing City Gas Distribution (CGD) networks in 21 states for transportation or distribution of natural gas to consumers in domestic, commercial or industrial and transport sectors through a network of pipelines.

For the hydro projects, the government will need to make efforts to expedite progress on capacity under construction through satisfactory Rehabilitation & Resettlement implementation.

India has also built its strategic petroleum reserves in order to meet any supply shocks due to any external exigencies like wars, natural disasters etc. Indian Strategic Petroleum Reserves Ltd, a special purpose vehicle under the Oil and Gas Ministry, has constructed three strategic petroleum reserves in huge underground rock caverns at Visakhapatnam on the East Coast, and at Mangaluru and Padur on the West Coast.

These facilities, with total capacity of 5.33 million tonnes, can meet about 10 days of India's crude oil requirements. India now plans to build another 6.5 million tonnes of storage at Padur and Chandikhol in Odisha which will augment its supply to 22 days.

India's Energy diplomacy:

India is setting up a web of energy relationships in the extended neighborhood covering Myanmar, Vietnam in the east, with Central Asian countries like Kazakhstan and Gulf countries in the west.

Indo-US Nuclear deal opened new vistas for India in field of Nuclear energy facilitating cutting edge technology and nuclear fuel. India has started to engage with China, Kazakhstan and Australia for nuclear fuel.

India's SCO membership could now play a bigger role in ensuring greater energy cooperation between energy producers and consumers by linking Central Asia and South Asia.

Promotion of Renewable Energy

A renewable energy capacity of 100 GW should be achieved by 2019-20 so as to contribute to achievement of 175 GW target by 2022.

Solar Energy Corporation of India Limited (SECI) should develop storage solutions within next three years to help bring down prices through demand aggregation of both household and grid scale batteries.

A large programme should be launched to tap at least 50% of the bio-gas potential in the country by supporting technology and credit support through NABARD by 2020.

Conclusion

Major transformations are underway in global energy sector, from growing electrification to the expansion of renewable energy, upheavals in oil production and globalization of natural gas markets. India needs to build its capacity in research and skills building to deal with these transformations in energy sector.

Challenges like carbon emissions, air pollution, and energy access outlines different possible future scenario for the energy security. The dynamic scenarios foreseen by Indian energy security scenarios, 2047(IESS) should guide the policy makers in Energy sector. India needs to ensure long term planning to ensure universal energy access and meeting its commitment under Paris Agreement to ensure sustainable and inclusive growth.

Throw light on the significance of road development in restructuring India's infrastructure scenario. Discuss while suggesting way forward to handle the current issues.

Livemint

Why this question:

Recently, After a robust FY19—the year preceding general elections—the pace of activity has slowed down. Year till date in FY20, a mere 500km of road projects have been awarded, raising doubts about NHAI's ability to fulfil the targeted 7,000-8,000km for the year.

Key demand of the question:

One has to discuss the significance of road development in restructuring India's infrastructure scenario.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the importance of Road as a key transport infrastructure.

Body:

Discuss the significance of road infrastructure and its contributions to the development of the economy.

Explain the issues associated in road development.

How can these issues be addressed?

Suggest solutions to overcome these challenges.

Conclusion:

Conclude by suggesting suitable solutions and way ahead.

- India's GDP growth rate slowed down to 5 per cent in Q1 of FY20 and is expected to be around 6 per cent or below in this financial year.
- As former Reserve Bank of India governor Y V Reddy mentioned recently, a combination of cyclical and structural factors have been responsible for the slowdown.
- Global uncertainties have added to the problem.
- In the last few weeks, the government has announced several measures to improve both consumption and investment in different sectors and for the economy as a whole.
- The announcement of reduction in corporate tax rates announced recently may help in reviving the sentiments of the private sector but the tax revenue may also decline and put pressure on fiscal deficit. But, these measures alone may not help in getting higher growth.

Structural issues to be tackled- We need to focus on three structural issues:

Physical infrastructure development, Raising human capital and Revival of rural economy for a long-term growth of 7 to 8 per cent and attaining \$5 trillion economy by 2024.

Infrastructure Development-

- Spending on infrastructure will have multiplier effects in the overall economy including stimulating private investment, aggregate demand and jobs.
- Construction sector was an important source of job creation during 2004-05 to 2011-12. This sector has to be revived in order to create growth and employment.
- The government seems to be fast tracking public capex, encouraging public sector enterprises (PSEs) to invest more and trying to clear the pending bills for the corporate sector and MSMEs.
- The announcement of Rs 100 lakh crore over five years for infrastructure by the government is an important measure.
- The **Vijay Kelkar committee's recommendation on PPPs** would be useful. The private sector's role is equally important.

Raising human capital for higher growth:

- **Health and education achievements** are essential for human capital. Yet the country's progress on both these aspects leaves much to be desired
- The Niti Aayog says that only **2.3 per cent of Indian workers have formal skill training compared to 70 to 80 per cent** in other countries.
- **Promotion of technology and knowledge economy** will add to growth. One can't have a "demographic dividend" for growth with low human capital.
- **Women's labour participation rates** have been low and declining. Raising women's human capital and participation rates can improve economic growth.
- We may also not achieve high human capital and productivity with **40 per cent of our children suffering from malnutrition.**

**Revival of rural economy:**

- **70 per cent of our population lives in rural areas** and has **stagnant incomes** and wages.
- There is a **need for revival of the rural economy** with infrastructure investment and structural reforms.
- **Agricultural marketing reforms** should be a priority.
- For better **price discovery**, agriculture has **to go beyond farming and develop value chains** comprising farming, wholesaling, warehousing, logistics, processing and retailing.
- **Agricultural exports should be promoted** with various policies. Similarly, rural infrastructure and water management are other priorities.

Stimulus and structural reforms can raise farmers' prices and wages and rise in demand for manufacturing and services.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

How is Chandrayaan-2 different from Chandrayaan-1? Critically analyse its objectives and challenges. Also, discuss how it's a breakthrough in the field of space research for ISRO.

Businesstoday

Why this question:

The question is in the backdrop of recently executed Chandrayaan -2.

Key demand of the question:

One must differentiate Chandrayaan-1 and Chandrayaan-2. Discuss in detail its objectives and challenges.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the context of the question.

Body:

The question is straight forward and there isn't much to deliberate.

Explain first the differences between the two missions and then explain the challenges faced and explain the significance of it in the field of science and technology.

Explain as well the role played by premier institutes like ISRO.

Conclusion:

Conclude with significance of such achievements.

Chandrayaan 2 is India's most ambitious space mission. While data from India's first lunar mission Chandrayaan 1 confirm the presence of water on the Moon without landing on the lunar surface, Chandrayaan 2 aimed to be the world's first mission to land on lunar South Pole.

| Chandrayaan 1 | Chandrayaan 2 |
|---|--|
| <ul style="list-style-type: none"> Had only Orbiter orbiting at hundred kilometres from lunar surface. It had 11 payloads - 5 from India, 3 from Europe, 2 from USA and 1 from Bulgaria Discovery of water on lunar surface mapping of chemicals and 3D topography | <ul style="list-style-type: none"> It has an Orbiter orbiting at hundred kilometres from lunar surface, Vikram Lander for soft landing near South Pole, Pragyan Rover. 13 Indian payload and one passive experimental Expanding lunar exploration from where Chandrayaan 1 has left |

| | |
|---|---|
| <ul style="list-style-type: none"> • PSLV rocket was used to launch Chandrayaan 1. | <ul style="list-style-type: none"> • GSLV MK3 space rocket it was used to launch Chandrayaan 2 |
|---|---|

Salient features of Chandrayaan 2 -

- In September 2008, the Chandrayaan-2 mission was approved by the government for a cost of Rs 425 crore.
- It is India's second mission to the moon.
- It aims to explore the Moon's South Polar Region.
- The mission is an important step in India's plans for planetary exploration, a program known as Planetary Science and Exploration (PLANEX).
- There are three components of the mission, an Orbiter, a lander and a rover.
- The mission payloads include — Terrain Mapping Camera which will generate a Digital Elevation Model (DEM) of the entire moon, Chandrayaan 2 Large Area Soft X-ray Spectrometer which will test the elemental composition of the Moon's surface Solar X-Ray Monitor which will provide solar X-ray spectrum inputs for CLASS.
- The Orbiter will be deployed at an altitude of 100 kilometres above the surface of the Moon. The lander will then separate from the Orbiter, and execute a soft landing on the surface of the Moon, unlike the previous mission which crash landed near the lunar south pole.
- The lander, rover and Orbiter will perform mineralogical and elemental studies of the lunar surface. The rover is named Pragyan.
- The mission's lander is named Vikram after Dr Vikram A Sarabhai, the Father of the Indian Space Programme.

Challenges faced -

- Very short window of 2 minutes for launching the mission.
- Non usability of parachute because of absence of atmosphere.
- Russia backing off from the mission.
- Very expensive project.
- Presence of Lunar dust.
- Extreme temperatures.
- Area of South Pole has lots of craters.
- Difficulty in manual controlling of the landing because of timeline.
- Soft landing was challenging.
- Translunar injection and lunar capture.

Why the south polar region of the moon?

According to ISRO, the lunar South Pole is an interesting surface area, which remains in shadow as compared to the North Pole. There is a possibility of the presence of water in permanently shadowed areas around it, the agency said, adding craters in the South Pole region have cold traps and contain fossil records of the early solar system.

The challenges along the way:

Challenges involved in the moon landing are identifying trajectory accurately; taking up deep space communication; trans-lunar injection, orbiting around the moon, taking up soft landing on the moon surface, and facing extreme temperatures and vacuum.

Significance

It will make India to join few allied space exploration Club of countries like USA Russia China. India would become first country to land on South Pole of the Moon. Chandrayaan 2 is a Landmark exploration step to make India a superpower and will yearn more in future exploration.

Challenges and Opportunities in front of India's Space Program -

India is still a developing country with vast developmental and security concerns. In this context it is very difficult to justify the allocations for space missions that do not have a direct bearing on development.

Successful launched of MOM and a planned rover onto the moon surely boosted the Indian space program. But India's reliance on satellites has created military vulnerabilities.

An anti-satellite missile (ASAT) tested by China in 2007 has also elevated the threat of a slow-moving arms race in space. DRDO is working on development of missile defence but it is increasingly looking to partner with the United States and other countries.

China has launched satellites for Pakistan and Sri Lanka in 2011 and 2012 respectively. This space cooperation may become another path for China to make inroads in South Asian countries.

During the starting of this decade India was highly critical of the EU effort to develop a code of conduct for outer space but in last years it has been actively engaged with the United States and the EU in particular in discussing a code of conduct and other safeguarding mechanisms.

India holds the view that reliance on the integration of outer space and cyber capabilities will only increase in future conflicts. But now beyond the maritime domain, India has been relying on foreign partners for many other satellite-based communications and data services. For instance, it continues to rely on NASA for deep space communications.

Privatization may also allow India to increase its launch capacity, which is currently at four to five per year while China does on average twenty or so launches. India does not have an explicit space policy to guide private sector participation.

ISRO also has internal constraints on its capacity to deliver.

The announcement by U.S. President Donald Trump in June 2018 about the creation of a "space force" or a sixth branch of the American armed forces has worried many including India. While India is officially committed to PAROS, or the prevention of an arms race in outer space, it is yet to

formulate a credible official response to such plans. India has yet to establish a credible space command of its own.

In this context China's reaction could be much stronger than its seemingly muted official response and it does possess a formidable space military programme that far exceeds current Indian capabilities.

Globally entrepreneurs like Elon Musk and Richard Branson began talking of space activities as independent profitable commercial ventures that can be termed as New Space revolution.

Now the time has come for a more structured approach that enables better incubation for young talent in India. Fortunately, Antrix is open to such ideas. Various policies and acts need to change from being restrictive to being enabling.

ISRO's role has been immaculate in making India a global space power; however, there are many challenges and prospects in the new space age that ISRO needs to focus on.

Discuss.

The hindu

Why this question:

The article discusses the role played by ISRO in making India a global power in the domain of space and the challenges and prospects it has for India's future space.

Key demand of the question:

One should bring out the potential of ISRO in the global space race and the challenges and prospects associated.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the context of the question.

Body:

Explain 'new space age' and mention the challenges and opportunities for ISRO. There is emergence of 'new space age' which is used to refer to a global sector of new aerospace companies and ventures working independently of governments to develop faster, better, and cheaper access to space for commercial purposes.

Discuss the opportunities in the new space age.

Conclusion:

With increasing competition, complexity and demand for space-related activities, there is a growing realization that national legislation is needed to ensure overall growth of the space sector. A New Space law for India should aim at facilitating growing India's share of the global space economy to 10% in the coming decade.

The Indian Space Research Organisation (ISRO)'s success has made India to be inducted in an elite group of countries, where India is rightfully acknowledged as a space power in the world. Space technology is dual-use technology, in this feat, apart from space research; ISRO has delivered many projects serving military as well as socio-economic needs of India.

However, demand for space-based services in India is far greater than what ISRO can supply.

Therefore, private sector investment is critical, for which a suitable policy environment needs to be created.

The potential areas and challenges for ISRO?

- Today, the value of the global space industry is estimated to be \$350 billion and is likely to exceed \$550 billion by 2025.
- Despite ISRO's impressive capabilities, India's share is estimated at \$7 billion (just 2% of the global market) covering broadband and Direct-to-Home television (accounting for two-thirds of the share), satellite imagery and navigation.
- Already, over a third of transponders used for Indian services are leased from foreign satellites and this proportion will rise as the demand grows.
- Developments in Artificial Intelligence (AI) and big data analytics have led to the emergence of 'New Space'.
- New Space entrepreneurship has emerged in India with many start-ups which seek value in exploring end-to-end services in the Business-to-Business and Business-to-Consumer segments using new space. However, these startups have yet to take off in the absence of regulatory clarity.
- So they need an enabling ecosystem, a culture of accelerators, incubators, venture capitalists and mentors that exists in cities like Bengaluru which is where most New Space start-ups have mushroomed.
- Also, the New Space start-ups discern a synergy with government's flagship programmes like Digital India, Startup India, Skill India and schemes like Smart Cities Mission.
- Another revolution underway is the small satellite revolution.
- Globally, 17,000 small satellites are expected to be launched between now and 2030.
- ISRO is developing a small satellite launch vehicle (SSLV) expected to be ready in 2019.
- It is a prime candidate, along with the proven PSLV, to be farmed out to the private sector.
- In this context, The Assembly, Integration and Testing (AIT) role, which is restricted to ISRO, must now be outsourced.
- Also years ago, ISRO launched the idea of Village Resource Centres to work in collaboration with local panchayats and NGOs but only 460 pilots have begun. Expanding this for rural areas is a formidable challenge but has the potential to transform rural India if properly conceived as a part of the India Stack and the Jan Dhan Yojana.

Further, with the Ministry of Defence now setting up a Defence Space Agency and a Defence Space Research Organization, ISRO should now actively embrace an exclusively civilian identity.

So with increasing competition, complexity and demand for space-related activities, there is a growing realization that national legislation is needed to ensure overall growth of the space sector. A New Space law for India should aim at facilitating growing India's share of the global space economy to 10% in the coming decade.

The government now has an opportunity to give priority to a new Bill that can be welcomed by the private sector, both the larger players and the start-ups alike. In any case, ISRO's hands are full with

new missions—deep space, scientific, human flight, commercial and strategic. However, to develop an aerospace industry with private investments and startups, India needs to develop a clear blueprint and also put in place a space regulatory system.

What is clean coal technology? Do you agree that clean coal is the next silver bullet for India's carbon emission reduction after solar energy? Analyse.

The hindubusinessline

Why this question:

Recently Union Minister of Science & Technology inaugurated the National Centre for Clean Coal Research and Development at Indian Institute of Science (IISc)-Bengaluru.

Key demand of the question:

One has to explain the concept of clean coal technology, and also in what way it has a key role to play in India's carbon emission reduction after solar energy.

Directive:

Analyze – When asked to analyze, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Define what is Clean coal technology

Body:

Clean coal technology is a collection of technologies being developed in attempts to lessen the negative environmental impact of coal energy generation and to mitigate worldwide climate change. The term "clean coal" has been applied to many technologies, ranging from wet scrubbers, which remove sulfur dioxide from coal-generated gas, to coal washing, which removes soil and rock from coal before it's sent to a factory.

Conclusion:

Conclude that the research in clean coal domain could potentially be game changer for meeting the energy needs of the country in terms of higher efficiency and capacity at lower operating costs and size.

Coal is by far the most abundant fossil fuel on earth. It is essentially carbon and is mainly used as a combustion fuel. Half of the world's electricity is generated by burning coal. Coal will remain a dominant energy source for years to come. Since CO₂ contributes to global warming, reducing its release into the atmosphere has become a major international concern.

Some 23% of primary energy needs are met by coal and 39% of electricity is generated from coal. About 70% of world steel production depends on coal feedstock. Coal is the world's most abundant and widely distributed fossil fuel source. The International Energy Agency (IEA) expects a 43% increase in its use from 2000 to 2020.

However, burning coal produces almost 14 billion tonnes of carbon dioxide each year which is released to the atmosphere, most of this being from power generation.

Development of new 'clean coal' technologies is addressing this problem so that the world's enormous resources of coal can be utilized for future generations without contributing to global warming. Much of the challenge is in commercializing the technology so that coal use remains economically competitive despite the cost of achieving low, and eventually 'near-zero', emissions. The technologies are both costly and energy-intensive.

As many coal-fired power stations approach retirement, their replacement gives much scope for 'cleaner' electricity. Alongside nuclear power and harnessing renewable energy sources, one hope for this is via 'clean coal' technologies, such as carbon capture and sequestration, also called carbon

capture and storage (both abbreviated as CCS) or carbon capture, use and storage (CCUS). It involves the geological storage of CO₂, typically 2-3 km deep, as a permanent solution.

Consequently the term 'clean coal' is increasingly being used for supercritical and ultra-supercritical coal-fired plants without CCS, running at 42-48% thermal efficiency. These are also known as high-efficiency low-emission (HELE) plants. The capital cost of ultra-supercritical (USC) HELE technology is 20-30% greater than a subcritical unit, but the higher efficiency reduces emissions and fuel costs to about 75% of subcritical plants. A supercritical steam generator operates at very high temperature (about 600°C) and pressures (above 22 MPa), where liquid and gas phases of water are no longer distinct. In Japan and South Korea about 70% of coal-fired power comes from supercritical and ultra-supercritical plants.

Advantages of Clean coal technology:

- Clean coal technology seeks to reduce harsh environmental effects by using multiple technologies to clean coal and contain its emissions.
- Some clean coal technologies purify the coal before it burns. One type of coal preparation, coal washing, removes unwanted minerals by mixing crushed coal with a liquid and allowing the impurities to separate and settle.
- Other systems control the coal burn to minimize emissions of sulfur dioxide, nitrogen oxides and particulates.
- Electrostatic precipitators remove particulates that aggravate asthma and cause respiratory ailments by charging particles with an electrical field and then capturing them on collection plates.
- Gasification avoids burning coal altogether. With gasification, steam and hot pressurized air or oxygen combine with coal in a reaction that forces carbon molecules apart. The resulting syngas, a mixture of carbon monoxide and hydrogen, is then cleaned and burned in a gas turbine to make electricity.
- Wet scrubbers, or flue gas desulfurization systems, remove sulfur dioxide, a major cause of acid rain, by spraying flue gas with limestone and water.
- Low-NO_x (nitrogen oxide) burners reduce the creation of nitrogen oxides, a cause of ground-level ozone, by restricting oxygen and manipulating the combustion process.

With government's efforts to push renewable energy due to international conventions on climate change, increase in carbon cess and other initiatives for lesser use of coal, there is a need for 'Vision 2030 for the coal sector', which takes into account the environmental factors such as reduction of carbon footprint, abatement of global warming. Thus in this aspect clean coal technologies are the best way forward.

Artificial Intelligence is the new oil, the new factor of production. Like the industrial revolution, it will transform every sector. Elucidate with subsequent examples.

[Downtoearth](#)

Why this question:

Technology is the key to build a thriving, resilient world, especially in India where high mobile penetration and the government's digital initiatives can work in tandem to bring a sustainable and affordable transformation for societal needs.

Key demand of the question:

The question is straightforward and aims to discuss the importance of AI and in what way it is a revolution to be witnessed soon.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief define AI.

Body:

Explain the evolution of AI, its significance. Discuss in what way connectivity and innovation in technology are transforming how organizations and governments operate.

With suitable examples explain how technology can aid development and help address issues of governance and turn it into good governance.

Discuss the associated concerns and challenges and in what way they can be addressed.

Conclusion:

Conclude with suitable examples and on a positive note.

Artificial Intelligence (AI) - AI is the science of building computers that can solve problems the way humans do. With intelligent machines enabling high level cognitive processes like thinking, perceiving, learning, problem solving and decision making, coupled with advances in data collection and aggregation, analytics and computer processing power, AI presents opportunities to complement and supplement human intelligence and enrich the way people live and work.

- The term was coined in 1956 by John McCarthy at the Dartmouth conference, Massachusetts Institute of Technology.
- It encompasses everything from robotic process automation to actual robotics.
- Recently it has become widely popular and gained prominence due to its multifaceted application ranging from healthcare to military devices.
- AI is a constellation of technologies that enable machines to act with higher levels of intelligence and emulate the human capabilities of sense, comprehend and act.
- The natural language processing and inference engines can enable AI systems to analyse and understand the information collected.

Applications of Artificial Intelligence (AI):

- **Self-driving Cars:** Advances in artificial intelligence have brought us very close to making the decades-long dream of autonomous driving a reality. AI algorithms are one of the main components that enable self-driving cars to make sense of their surroundings, taking in feeds from cameras installed around the vehicle and detecting objects such as roads, traffic signs, other cars, and people.
- **Digital assistants and smart speakers:** Siri, Alexa, Cortana, and Google Assistant use artificial intelligence to transform spoken words to text and map the text to specific commands. AI helps

digital assistants make sense of different nuances in spoken language and synthesize human-like voices.

- **Translation:** For many decades, translating text between different languages was a pain point for computers. But deep learning has helped create a revolution in services such as Google Translate. To be clear, AI still has a long way to go before it masters human language, but so far, advances are spectacular.
- **Facial recognition:** Facial recognition is one of the most popular applications of artificial intelligence. It has many uses, including unlocking your phone, paying with your face, and detecting intruders in your home. But the increasing availability of facial-recognition technology has also given rise to concerns regarding privacy, security, and civil liberties.
- **Medicine:** From detecting skin cancer and analyzing X-rays and MRI scans to providing personalized health tips and managing entire healthcare systems, artificial intelligence is becoming a key enabler in healthcare and medicine. AI won't replace your doctor, but it could help to bring about better health services, especially in underprivileged areas, where AI-powered health assistants can take some of the load off the shoulders of the few general practitioners who have to serve large populations.
- **Agriculture Sector:** AI can be used to predict advisories for sowing, pest control, input control can help in ensuring increased income and providing stability for the agricultural community. Image classification tools combined with remote and local sensed data can bring a revolutionary change in utilization and efficiency of farm machinery, in areas of weed removal, early disease identification, produce harvesting and grading.
- **Business Sector:** To take care of highly repetitive tasks Robotic process automation is applied which perform faster and effortlessly than humans. Further, Machine learning algorithms are being integrated into analytics and CRM platforms to provide better customer service. Chatbots being used into the websites to provide immediate service to customers. Automation of job positions has also become a talking point among academics and IT consultancies such as Gartner and Forrester.
- **Education Sector:** AI can make some of the educational processes automated such as grading, rewarding marks etc. therefore giving educators more time. Further, it can assess students and adapt to their needs, helping them work at their own pace. AI may change where and how students learn, perhaps even replacing some teachers.
- **Financial Sector:** It can be applied to the personal finance applications and could collect personal data and provide financial advice. In fact, today software trades more than humans on the Wall Street.
- **Legal Sector:** Automation can lead to faster resolution of already pending cases by reducing the time taken while analyzing cases thus better use of time and more efficient processes.
- **Manufacturing sector:** Robots are being used for manufacturing since a long time now; however, more advanced exponential technologies have emerged such as additive manufacturing (3D Printing) which with the help of AI can revolutionize the entire manufacturing supply chain ecosystem.
- **Intelligent Robots:** Robots can perform the tasks given by a human because of sensors to detect physical data from the real world such as light, heat, temperature, movement, sound, bump, and pressure. Moreover, they have efficient processors, multiple sensors and huge memory, to exhibit intelligence. Further, they are capable of learning from their errors and therefore can adapt to the new environment.

- **Gaming:** AI has a crucial role in strategic games such as chess, poker, tic-tac-toe, etc., where the machine can think of a large number of possible positions based on heuristic knowledge.
- **Cyber Security:** In the 20th conference on e-governance in India it was discussed that AI can provide more teeth to cyber security and must be explored.
- **Smart Cities and Infrastructure:** Use of AI to monitor patronage and accordingly control associated systems such as pavement lighting, park maintenance and other operational conditions could lead to cost savings while also improving safety and accessibility.

Conclusion

Many experts have described the rise of automation as one of the most important economic and social developments in history. The World Economic Forum (WEF) has characterized it as the fulcrum of a 4th Industrial Revolution. Moreover, the economist Andrew McAfee said, "Digital technologies are doing for human brainpower what the steam engine and related technologies did for human muscle power during the Industrial Revolution. They're allowing us to overcome many limitations rapidly and to open up new frontiers with unprecedented speed. It's a very big deal. But how exactly it will play out is uncertain."

It may cause unemployment, unease in the mindset of masses, and even social conflict at many conflicts at many reasons. In the short run, it is very difficult to predict who will get the most of the benefits however better policy guidelines, better regulations, and social security measures will essentially bring overall goodness to the society.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

What do you understand by space tourism? Discuss its origin and explain what can the space tourist look forward to and the benefits of future of flying tourists into space.

Livemint

Why this question:

The question is in the context of recent endeavors made by the Indian space agency and thus the need to analyse the potential it holds in coming future.

Key demand of the question:

One needs to discuss the concept of space tourism and the potential it holds.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Space tourism is human space travel for recreational purposes.

Body:

With India's latest lunar mission Chandrayaan-2 set to boldly go where no country has gone before, the Moon's south polar region, it is on course to throw open new possibilities for the world.

Then discuss the summary of the main driver, opportunities, challenges, current market trends and strategies impacting the global Space Tourism market.

Discuss the role of private sector companies, how they have evolved over the years.

Conclusion:

Conclude with potential holds in the industry and the avenues in the coming future

Space tourism, recreational space travel, either on established government-owned vehicles such as the Russian Soyuz and the International Space Station (ISS) or on vehicles fielded by private companies. Since the flight of the world's first space tourist, American businessman Dennis Tito, on April 28, 2001, space tourism has gained new prominence

Drivers

- Ongoing space exploration by different Agencies like ISRO, NASA etc. has cultivated huge interest in humanity for space travel
- Sci fi movies such as interstellar Gravity Martian as showcased space as an adventurous place
- First manned mission into space and astronauts who has travelled into space are considered hero in our society the placing of International Space Station has need constant human presence into to space necessary
- Ongoing advancement in science and technology is making space travel more efficient. What is example people are thinking of Mars one mission which is one way journey to the Mars and establishing human settlement there
- In developed countries the tourism business is approaching its saturation space tourism is opening a new Avenue for the business

Benefit of space tourism

- Cost of reaching space will go down with increase in competition revenue generated from space tourism will further support space exploration and the cost will reduce in a same way the cost of air travel has reduced.
- Due to Technical Advancement and increasing use of space by human there will be use of space technology in other fields of human life such as travelling time across the globe will be reduced drastically to an hour or two by using hypersonic travel
- It will inspire new generation of Engineers
- Job creation - there are many companies that are there in space tourism business these company has not existed a few decades ago growth of space tourism will also generate more of a manufacturing job engineering job service sector job life Pilots etc
- It can give additional support to space research and development like asteroid mining
- Which space tourism chances of space getting militarized will be avoided

Challenges

- Very steep initial cost the degree of sophistication and the technology used in space make this business very costly
- Chances of catastrophic disaster - space is a very hostile place for human survival and it does not operate in anyway any of slightest mistake can lead to great loss of life and property
- Sustainability of the business - the customer base being extremely low, the cost of travel tends to remain high throughout may cause sustainability issue

- Health effect of space travel - DNA damage bone loss muscles loss blood pressure problem are the health issues associated with space radiation and microgravity present in space
- Environmental effect- according to the study by NASA 1000 sub orbital launches releases 600 tons carbon black into stratosphere it has potential to create strong hemispheric climatic assembly pollution from this industry can also accelerate global warming and damage ozone layer
- International orders - according to outer space Treaty 1967 outer space is not subjected to National appropriation by claims of sovereignty or by means of occupation.

Present trends

After first space tourism in 2001 as many as eight people has travelled 2 space for tourism purpose. Presently mainly private companies such as blue origin Virgin Galactic space adventure Limited Arora Space Station a Start-up form space X etc. are venturing into this business with their own ambitious projects and capital. 2010 report by Federal aviation administration predicted that space tourism can become a billion dollar market within 20 years

Conservation, environmental pollution and degradation, environmental impact assessment

Viewing the transnational challenge of climate change through the narrow lens of nationalism will only spell more disasters. Critically analyze.

The hindu

Why this question:

The article is premised on the recent incidences of Amazon forest fires and it explains in detail in what way climate change is a transnational challenge and that narrow lens of nationalism will only lead to more grave concerns.

Key demand of the question:

One must discuss in detail the pan- global nature of the climate change and in what way it needs to be handled with cumulative efforts of the world countries and isolated, nationalistic tendencies will only hamper and aggravate the climate change issue.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In brief narrate the issue of climate change.

Body:

Explain in what way the election of Jair Bolsonaro in Brazil not only marks the rise of another populist nationalist leader on the world stage. It's also a turning point for the global politics of climate change.

Discuss that Mitigation policies require leaders to expend short-term political capital for long-term economic and environmental gains. However, populists have shown a particularly strong disinterest for doing so, particularly if those short-term costs would affect their prioritized group of the people. Explain with example the entire issue and what needs to be done.

Conclusion:

Conclude with way forward.

Climate change is modification of global climate and weather patterns it occurs due to the changes in atmosphere and its interaction with other geological chemical or biological factors. The on-going climate change is referred as global warming. It is mainly attributed to anthropogenic activities such as use of fossil fuels as energy source and unsustainable agricultural practices like clearing of forest and use of chemicals.

Scale of global warming:

- **Rising sea level**- nearly 650 million people are threatened due to rising Sea Level Island countries like Maldives, Philippines, Samoa, Nauru, etc. may sink completely
- **Climate refugee**- sea level rise will displace large number of people in future which will intensify the present in refugee crisis in the world
- **Abnormal weather patterns**- summers and winters are becoming more extreme frequency of cyclone is increasing incidences of flood and deficient rainfall has also increased
- **Shortage of food** - with erratic and extreme weather phenomena the global food production is bound to suffer causing large-scale hunger problem.
- **Reducing ice cover** - global warming will expose peatland of tundra region means decomposition will start there that will release massive amount of carbon locked in
- **Ecosystem destruction** - rise in global city temperature has caused coral bleaching melting of ice caps in arctic sea habitat of polar bear tundra belt is also shrinking sixth major extinction is on the move

In short global warming is the greatest obstacle in attaining sustainable development goal.

International Cooperation -

- 1972 first Earth summit
- 1992 UNCED / Rio summit - Which resulted in Rio Declaration on Environment and Development, Agenda 21, Forest Principle. Legally binding agreements like CBD, UNFCCC, united nation convention to combat desertification.
- 2002 world summit on sustainable development
- 2012 united nation conference on sustainable development / Rio + 20.
- 2014 where is summit under UNFCCC
- Countries declared their INDC and India launched international solar alliance (ISA).
- Most successful example of international cooperation in handling global environment issue is Montreal protocol to tackle ozone depletion

Nationalism versus climate change -

- Developing vs. developed country - developing countries not ready to compromise on their Right to Develop. Developed countries are not adhering to Common but Differentiated Responsibility
- Lack of support from developed countries has caused developing and LDC countries to exploit globally important natural resources present with them to keep up with economic development.

Example - Brazil's amazon forest exploited in so unsustainable manner that previously fire resistant forest has now become prone to forest fire.

- Global economic slowdown is forcing countries to overlook environment for short term economic goal by hiding it in their nationalist propaganda.

Example USA has threatened to move out of Paris agreement it is planning to revive construction of keystone xl pipeline to bring carbon heavy Canadian tar sands to its refinery.

- Rising xenophobia and ultra-nationalism is preparing hard bed for climate refuses of future.

Way forward

According to **IPCC special report 2018** - To limit global temperature rise to 1.5 degree Celsius of pre industrialisation phase, the mission cut 25% by 2030 and hundred per cent by 2075 and rapid for teaching and unprecedented change in all aspects of society will be required. Therefore, **Common but differentiated responsibility** principle must be adhered to strictly.

- Developing countries such as India and china must extend their supports for or reducing global emission
- Helping hand to IDC so that they do not land of destroying the environment for economic gain
- Changes in agricultural practices like large scale adoption of zero budget natural farming.
- All countries must extend their support to ISA to make it a real success.

Conclusion

The real nationalism is not limited by economic gain but it extends to all aspects of society. Formation Elysium to exist earth must be saved for human survival first.

Where does India stand on plastic waste management today? Discuss the solutions and alternatives to the plastic menace of India.

[The hindu](#)

Why this question:

The article discusses in detail the issue of plastic menace India is dealing with.

Key demand of the question:

One must explain the current state of plastic waste management in India and the urgency to tackle them. Discussion should capture the way forward to handle the issue and suggest solutions and alternatives.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

**Introduction:**

In brief quote facts to suggest the plastic menace the world is dealing with.

Body:

Explain in detail the issue of plastic in India, where does India stand today in terms of managing the waste produced by use of plastic.

Discuss various initiatives and policies taken by the govt. recently to tackle the issue.

What more can be done to address.

Conclusion:

Conclude with way forward.

On August 15, in his Independence Day address, Prime Minister Narendra Modi called for a **movement to eliminate single use plastic in India**. The government is reported to be working on a ban on certain plastic items of common use such as carry bags, cutlery and plates under the Environment (Protection) Act, and this may be announced on October 2.

The Central Pollution Control Board (CPCB) **has pulled up 52 companies for not specifying a timeline or plan to collect the plastic waste** that they generate. The companies that have been pulled up include Amazon, Flipkart, Patanjali Ayurved Limited, etc.

Where does India stand on plastic waste?

- **Per capita consumption** of plastic is projected **to go up from 11 kg in 2014-15 to 20 kg by 2022** (Federation of Indian Chambers of Commerce and Industry data); about 43% is single use packaging with poor rates of recovery.
- In spite of the notification of the **Plastic Waste Management (PWM) Rules, 2016**, and amendments made two years later, **most cities and towns are not prepared to implement its provisions**.
- Even the **biggest Municipal Corporations** shouldering a **staggering waste burden** have **failed to implement segregation of waste**: collecting recyclable plastic, non-recyclable plastic and other waste separately for processing by material recovery facilities.
- An amendment to the PWM Rules in 2018, by which a **six month deadline** was fixed for producers to **arrange for recovery of waste in partnership with State Urban Development departments**, has made little progress.

Are alternatives such as compostable or biodegradable plastics available?

- Although compostable, biodegradable or even edible plastics made from various materials such as **bagasse** (the residue after extracting juice from sugarcane), **corn starch**, and **grain flour** are promoted as alternatives, these currently have **limitations of scale and cost**.
- In India in the **absence of robust testing and certification to verify claims** made by producers, **spurious biodegradable and compostable plastics** are entering the marketplace.
- In January this year, **the CPCB said that 12 companies were marketing carry bags and products marked 'compostable' without any certification**, and asked the respective State Pollution Control Boards to take action on these units.

What can be the possible solutions to the problem?

- **A ban on single use plastic items would have to lay down a comprehensive mechanism to certify the materials marketed as alternatives**, and the specific process required to biodegrade or compost them.
- The solutions can be **packaging innovation and upscaling waste segregation, collection and transmission**.
- **Recovering materials from garbage should be a high priority**, considering that India is the third highest consumer of materials.
- A movement against plastic waste would have to **prioritise the reduction of single use plastic** such as multilayer packaging, bread bags, food wrap, and protective packaging. Consumers often have no choice in the matter.
- **Municipal and pollution control authorities** must also be **held accountable** for the lapses.

Conclusion-

Packaging is projected to **grow into a \$72.6 billion industry in India by 2020** from about \$31 billion in 2015, with a proportionate rise in waste volumes. The **pressure on producers to streamline the collection, recycling and processing** of all forms of plastic is **bound to grow**. **Individuals and organizations** should now **actively remove plastic waste from their surroundings** and municipal bodies must arrange to collect these articles. **Startups and industries should think of newer ways of recycling**.

Coming together of global powers is vital for the design of policies against climate change. Discuss in the context of Brazil's initial refusal of international support in the Amazon fire crisis.

Livemint

Why this question:

The article captures the current ongoing environmental crisis that the South American countries are facing owing to alarming Amazon forest fires.

Key demand of the question:

One must bring out the necessity of collective responsibility of global powers in handling such threats to the mother nature through collective policies against climate change.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the current scenario.

Body:

Explain in brief the issue of forest fires and the gravity of the situation – areas affected by the calamity, what are the causes of concern.

Explain How the government of Brazil has dealt with the crisis? - issues involved therein. – President Jair Bolsonaro has made things a lot worse by weakening the environment agency, attacking conservation NGOs and promoting the opening of the Amazon to mining, farming and logging. The agricultural lobby is powerful in Brazil and it has steadily eroded the protection system that was so successful from 2005-2014. Deforestation crept up in the past five years under the previous presidents Dilma Rousseff and Michel Temer. The rate has accelerated rapidly in the first eight months of current president Bolsonaro's rule.

Then discuss the need for collective global policy and urgent need of it.

Conclusion:

Conclude with way forward.

Climate change is modification of global climate and weather patterns it occurs due to the changes in atmosphere and its interaction with other geological chemical or biological factors

Scale of global warming:-

- **Rising sea level-** nearly 650 million people are threatened due to rising sea level island countries like Maldives, Philippines, Samoa, Nauru, etc. May sink completely
- **Climate refugee-** sea level rise will displace large number of people in future which will intensify the present in refugee crisis in the world
- **Abnormal weather patterns-** summers and winters are becoming more extreme frequency of cyclone is increasing incidences of flood and deficient rainfall has also increased
- **Shortage of food** - with erratic and extreme weather phenomena the global food production is bound to suffer causing large-scale hunger problem
- **Reducing ice cover** - global warming will expose peatland of tundra region means decomposition will start there that will release massive amount of carbon locked in
- **Ecosystem destruction** - rise in global city temperature has caused coral bleaching melting of ice caps in arctic sea habitat of polar bear tundra belt is also shrinking sixth major extinction is on the move

In short global warming is the greatest obstacle in attaining sustainable development goal. Seeing the global scale of the problem coming together of global powers is vital for the design of policies against climate change.

Amazon forest fire-

Amazon is responsible for 20% of oxygen generation and home to 10% of world's known biodiversity. It is called Lungs of Earth. Our planet's lungs is burning, there is haze over an area equal to that of India in Amazon.

But recently Brazil had declined foreign aid for controlling the worst forest fire ever in Brazil citing the sovereignty issue over the statement by France

Response of Brazilian government

- At first it denied that forest fire is due to human reason
- It even denied any activity of deforestation and crime in the forest
- It is stated that 'it is unfair that use mineral resources is reserved for amazon tribes'
- Brazil wants to exploit mineral reserves present in amazon forest for this it is taking support from mining industries in USA (another climate change denier)

Repercussions for Brazil -

- Tarnishing Brazil's image as a green villain at international level.

- Shut down of The Amazon Fund mainly from Norway and Germany for preserving the rainforest.
- Boycott of Brazilian products by consumers around the world

Challenges

- **Developing vs developed country** - developing countries not ready to compromise on their **Right to Develop**. Developed countries are not adhering to Common But Differentiated Responsibility
- **Lack of support from developed countries** has caused developing and LDC countries to exploit globally important natural resources present with them to keep up with economic development.
 - **Example** - Yasuni National park - Ecuador Had asked for global aid to not explore and exploit resources in NP for economic purpose, but world did not responded positively.
- **Global economic slowdown** is forcing countries to overlook environment it for short term economic goal by hiding it in there nationalist propaganda.
 - **Example** USA has threatened to move out of Paris agreement it is planning to revive construction of keystone xl pipeline to bring carbon heavy Canadian tar sands to its refinery

Way forward

According to IPCC special report 2018

To limit global temperature rise to 1.5 degree Celsius of pre industrialisation phase, deep mission cut 25% by 2030 and hundred percent by 2075 and rapid for teaching and unprecedented change in all aspects of society will be required

Therefore,

- All countries must come together and form some International forest monitoring body on the line of international atomic energy association to look after the use of forest globally
- Funding mechanism must be kept in place to give funds to the country for maintenance and protection of their forest in the same way finance commission of India takes into account the forest cover for disbursing grants to the states
- Developed countries should extend a helping hand to needy developing countries so that they can also enjoy their right to develop without damaging the environment
- Nationalism must be replaced by globalism in matter as Global as climate change
- Common but differentiated responsibility principle must be adhered to strictly.
- Changes in agricultural practices like large scale adoption of zero budget natural farming
- All countries must extend their support to ISA to make it a real success.

Conclusion -

Since climate change is a global issue there is a need for collective global policy to meet the sustainable development targets and preserving such large-scale ecosystem. This policy would help

agencies to prevent individual country action to destroy ecosystems & meeting emission norms & controlling global temperature rise targets.

“An effective implementation of the Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights Act) of 2006 is an opportunity for India to demonstrate a model of conservation where historic missteps are addressed while being strategic about the commitments to climate and biodiversity action”. Comment.

Hindustantimes

Why this question:

The article discusses the implementation of Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights Act) of 2006 with respect to the environmental concerns.

Key demand of the question:

One

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief narrate the provisions of the act.

Body:

Discussion should be based on the fact that while it is true that human activity has resulted in unprecedented environmental destruction as well as the extinction of species, there is also evidence of alternative paradigms where community-led forest conservation initiatives have been successful in preventing the over-exploitation of natural resources.

Take hints from the article and explain the challenges involved.

Suggest what measures are needed to be taken to handle the challenges.

Conclusion:

Conclude with way forward.

Rights under the Act:

Title rights – ownership to land that is being farmed by tribal or forest dwellers subject to a maximum of 4 hectares; ownership is only for land that is actually being cultivated by the concerned family, meaning that no new lands are granted.

Use rights – to minor forest produce (also including ownership), to grazing areas, to pastoralist routes, etc.

Relief and development rights to rehabilitate in case of illegal eviction or forced displacement; and to basic amenities subject to restrictions for forest protection. Forest management rights to protect forests and wildlife.

Eligibility:

Eligibility to get rights under the Act is confined to those who “primarily reside in forests” and who depend on forests and forest land for a livelihood. Further, either the claimant must be a member of the Scheduled Tribes scheduled in that area or must have been residing in the forest for 75 years.

Why this law was necessary?

What are called “forests” in Indian law often have nothing to do with actual forests. Under the Indian Forest Act, areas were often declared to be “government forests” without recording who lived in these areas, what land they were using, what uses they made of the forest and so on. 82% of Madhya forest blocks and 40% of Orissa’s reserved forests were never surveyed; similarly 60% of India’s national parks have till today not completed their process of enquiry and settlement of rights. As the Tiger Task Force of the Government of India put it, “in the name of conservation, what has been carried out is a completely illegal and unconstitutional land acquisition programme.” Hence, this was law necessary.

Various factors that have prevented the proper implementation of the FRA since its passage in 2006 include:

Process of documenting communities’ claims:

The process of documenting communities’ claims under the FRA is intensive — rough maps of community and individual claims are prepared democratically by Gram Sabhas. These are then verified on the ground with annotated evidence, before being submitted to relevant authorities.

The Gram Sabha is treated as a public authority under the FRA, and if the higher authorities under the law reject its claims, substantive reasons have to be provided for doing so. This exhaustive process is why the official diktat to implement the FRA so quickly lacks any understanding about the extent of the task and labour involved.

Reluctance of the forest bureaucracy to give up control:

Another main factor inhibiting the FRA’s full implementation is the reluctance of the forest bureaucracy to give up control. The forest bureaucracy has misinterpreted the FRA as an instrument to regularise encroachment. This is seen in its emphasis on recognising individual claims while ignoring collective claims — Community Forest Resource (CFR) rights as promised under the FRA — by tribal communities.

To date, the total amount of land where rights have been recognised under the FRA is just 3.13 million hectares, mostly under claims for individual occupancy rights.

Narrow interpretation of the FRA:

The narrow interpretation of the FRA is also to be blamed. It is against the letter and spirit of the law, which seeks to undo historical injustices and return the forests to community jurisdiction. It also contradicts the estimates for forest area collectively used by tribal and other forest communities that are provided by government agencies themselves.

Environment Ministry’s moves:

The Environment Ministry’s conduct also causes concern. Entrusted with stewarding our forests, it has instead concentrated great energy on how to hasten their felling (through the forest clearances it awards). In doing this, it appears that it has, among other things, mounted a prolonged effort to see if and how meaningful community participation can be eliminated from the clearance process.

What needs to be done now?

- The government can start by recognising the role played in the FRA’s meagre implementation by the forest bureaucracy’s resistance as well as the acute lack of awareness of FRA’s community

rights provisions in State administrations and forest communities. In almost all States, the Forest Department has either appropriated or been given effective control over the FRA's rights recognition process. This has created a situation where the officials controlling the implementation of the law often have the strongest interest in its non-implementation, especially the community forest rights provisions, which dilute or challenge the powers of the forest department.

- If the government is serious about implementing the FRA, it should confront the forest bureaucracy and make it clear that any obstruction on their part is unacceptable. The little progress that has been made in implementation so far has been due to close coordination between tribal departments, district administrations and civil society.
- There is also a clear need to strengthen the nodal tribal departments, provide clear instructions to the State and district administrations, and encourage civil society actors. Without a strong political will, this historical transformation is unlikely to take place.
- **Many states have a poor record of implementation of the act:** Bihar, Jharkhand, Himachal Pradesh, Karnataka, Kerala, Odisha, Telangana, Uttarakhand, Uttar Pradesh and West Bengal have been identified as having lagged behind in implementation of the FRA. The misuse of a law cannot be the reason to dilute it or call for its repeal. Land is a valuable resource for those who live off it and one way of ensuring lesser fragmentation is to approve community forest rights which take a long time for clearance. People are at the centre of protecting forests and conservation and if the FRA is not delivering its promise, it can be blamed squarely on the government's devious approach and its barely concealed intent to enfeeble the law.

Conclusion:

The implementation of the Forest Rights Act, 2006 has been opaque and there is serious lack of awareness about its provisions not only among the beneficiaries but also among the officials in charge of implementing it. Given the complaints from either side, it is time the government reviewed the law and also looked at the objections raised when it was first tabled as a bill.

Bring out the issue of desertification in India and discuss the importance of the United Nations Convention to Combat Desertification.

[Downtoearth](https://www.downtoearth.org.in/news/india/bring-out-the-issue-of-desertification-in-india-and-discuss-the-importance-of-the-united-nations-convention-to-combat-desertification-43888)

Why this question:

The article talks about the significance of research that could hold the key for global land restoration effort and that there is a need for collaboration among scientists, government and farming communities, as suggested by scientists on the sidelines of United Nations Convention to Combat Desertification's (UNCCD) 14th Conference of Parties (CoP 14) going on from September 2, 2019, until September 13.

Key demand of the question:

One must bring out the issue of desertification in India and discuss the importance of the United Nations Convention to Combat Desertification.

Directive:

***Discuss** – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.*

Structure of the answer:

Introduction:

Discuss the context of the question.

**Body:**

In brief explain what desertification is.

Then explain the role of UNCCD – It is the sole legally binding international agreement linking environment and development to sustainable land management. It is the only convention stemming from a direct recommendation of the Rio Conference's Agenda 21.

Explain what is the need of the hour – Responsible land governance is key to provide an enabling environment for ecosystem restoration, biodiversity protection, and land use-based adaptation and for improving the livelihoods of many small-scale farmers etc.

Conclusion:

Conclude with way forward.

Desertification is a land degradation process in which a relatively dry land is converted into a desert. In this process land loses its water bodies as well as biodiversity (vegetation and wildlife). Desertification is the ultimate stage in land degradation process.

Global scenario:

- According to a UNCCD report, land degradation due to drought and desertification affects about 1.9 billion hectares of land and 1.5 billion people globally.
- According to United Nations, every year, the world loses 24 billion tons of fertile soil and dry land degradation reduces national domestic product in developing countries by up to 8 % annually.
- Goal 15 of the 2030 Agenda for Sustainable Development states our resolve to halt and reverse land degradation.

Indian scenario

- According to ISRO space application centre
- 82.6 million hectares 25% of land in India is under desertification
- 96.4 million hectares of land in India is undergoing degradation
- There is increase 1.16 million hectare under desertification in just eight years (2005-2013)
- Land Degradation caused ~\$48 billion annually to India (2% of GDP)

In India, the main reason for desertification is loss of soil cover, mainly due to rainfall and surface runoff. It is responsible for 10.98 per cent of desertification in the country. Water erosion and wind erosion are the two other main reasons in India.

Steps by India

- Desert Development Programme.
- Integrated Watershed Management Programme which is now subsumed under Pradhan Mantri Krishi Sinchai Yojana.
- National agriculture policy 2000
- National Mission on Green India which is a part of National Action Plan on Climate Change.

- National Afforestation Programme.
- Soil Conservation in the Catchment of River Valley Projects and Flood Prone Rivers.
- National Watershed Development Project for Rain fed Areas.
- Fodder and Feed Development Scheme - a component of Grassland Development including Grass Reserves
- Command Area Development and Management Programme.
- national water policy 2012
- National forest Policy 1988

Role of UNCCD

- United Nation convention to combat desertification was adopted in 1994
- It was one of the three legally binding agreement put forth in 1992 Rio Earth summit
- It is the sole legally binding International agreement linking environment and development to sustainable Land management
- It is the most comprehensive Global commitment to achieve Land Degradation neutrality
- Global mechanism was established under article 21 of UN CCD specifically to assist countries in the mobilisation of financial resources to implement the convention and address desertification
- Committee on science and technology under article 24 of UN CCD to provide information and advice on scientific and technological matter relating to combating desertification to conference of party (CoP).
- UN CCD 2018-2030 framework to achieve Land Degradation neutrality by 2030 improve life of 1.3 billion people and reduce impact of drought on them

Causes of desertification

- Overgrazing: Animal grazing is a huge problem for many areas that are starting to become desert biomes. If there are too many animals that are overgrazing in certain spots, it makes it difficult for the plants to grow back, which hurts the biome and makes it lose its former green glory.
- Deforestation: When people are looking to move into an area, or they need trees in order to make houses and do other tasks, then they are contributing to the problems related to desertification. Without the plants (especially the trees) around, the rest of the biome cannot thrive.
- Farming Practices: Some farmers do not know how to use the land effectively. They may essentially strip the land of everything that it has before moving on to another plot of land. By stripping the soil of its nutrients, desertification becomes more and more of a reality for the area that is being used for farming.
- Soil erosion: Only top soil supports vegetation, without top soil no vegetation, without vegetation land will degrade into desert.

- Urbanization and other types of land development. As mentioned above, development can cause people to go through and kill the plant life. It can also cause issues with the soil due to chemicals and other things that may harm the ground. As areas become more urbanized, there are less places for plants to grow, thus causing desertification.
- Climate Change: Climate change plays a huge role in desertification. As the days get warmer and periods of drought become more frequent, desertification becomes more and more eminent. Unless climate change is slowed down, huge areas of land will become desert; some of those areas may even become uninhabitable as time goes on.
- Stripping the land of resources. If an area of land has natural resources like natural gas, oil, or minerals, people will come in and mine it or take it out. This usually strips the soil of nutrients, which in turn kills the plant life, which in turn starts the process toward becoming a desert biome as time goes on.
- Natural Disasters: There are some cases where the land gets damaged because of natural disasters, including drought. In those cases, there isn't a lot that people can do except work to try and help rehabilitate the land after it has already been damaged by nature.

Conclusion

More than two billion hectares of degraded land in various parts of the world can be rehabilitated. The techniques include integrated farming, agro-forestry and farmer-managed natural regeneration. Small community initiatives like closure of degraded lands for grazing, curtailing farming, growing fast-growing plants, raising tall trees that serve as a barrier against winds and sandstorms are very effective. Further sustainable management of soil, water and biodiversity are required for protecting the land from further degradation.

What do you understand by land degradation? Do you think restoration of degraded lands would also address water scarcity issue in the country? Discuss.

The hindu

Why this question:

In an address while hosting the COP -14 of UNCCD, prime minister Narendra Modi in his address said that this target would be achieved with an emphasis on “degraded agricultural, forest and other wastelands by adopting a landscape restoration approach.” This would also address water scarcity, enhance water recharge in forests, slow down water run-off and retain soil moisture.

Key demand of the question:

One must explain in detail clearly as to how restoration of degraded lands would also address water scarcity issue in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the excerpts of the speech.

Body:

Explain what you understand by land degradation.

Highlight the status of India and land-use – India faces a severe problem of land degradation, or soil becoming unfit for cultivation. About 29% or about 96.4 million hectares are considered degraded.

Discuss efforts made by India to tackle the issue.

Most importantly explain how addressing land degradation issues will also address the issue of water scarcity.

Conclusion:

Conclude with way forward.

Land degradation is reduction or loss of biological or economic productivity... resulting from land uses or from a process or combination of processes, including ... human activities.

Indian scenario

- According to ISRO's Space Application Centre
- 96.4 million hectares of land in India is undergoing degradation
- 82.6 million hectares 25% of land in India is under desertification
- There is increase 1.16 million hectare under desertification in just eight years (2005-2013)
- Land Degradation caused ~\$48 billion annually to India (2% of GDP)

In India, the main reason for desertification is loss of soil cover, mainly due to rainfall and surface runoff. It is responsible for 10.98 per cent of desertification in the country followed by vegetation degradation (8.91 percent) and wind erosion (5.55 percent).

Land degradation is a global problem largely related to agricultural use. Causes include:

- Land clearance, such as clearcutting and deforestation
- Agricultural depletion of soil nutrients through poor farming practices
- Livestock including overgrazing and over drafting
- Inappropriate irrigation and over drafting
- Urban sprawl and commercial development
- Vehicle off-roading
- Quarrying of stone, sand, ore and minerals
- Increase in field size due to economies of scale, reducing shelter for wildlife, as hedgerows and copses disappear
- Exposure of naked soil after harvesting by heavy equipment
- Monoculture, destabilizing the local ecosystem
- Dumping of non-biodegradable trash, such as plastics
- Invasive Species
- Soil degradation, e.g.
 - Soil contamination
 - Soil erosion
 - Soil acidification

- Loss of soil carbon

Land restoration includes

Restoration of vegetation - vegetation cover prevents soil erosion, it increases water run-off time thus giving time for water to percolate into earth=> improves ground water level. Forest is considered as lakhs of check dams.

Restoration of soil - this in turn enhances the life support capability of the land, hence helps in restoration of vegetation.

Restoration of water bodies - this includes restoring wetlands, lake, river etc.

In reality vegetation, soil and water bodies all are inter dependent. Ultimately results in enhancement in water availability.

Thus in India where 67% of land is dry land and 30% of land is under degradation, reversing the degradation will also have potential to solve problem of water scarcity.

Mostly in southern states there is an acute shortage of water example Chennai in 2019 has declared emptying of ground water. Restoring of ground water table by using traditional and scientific water harvesting technique and conserving wetland like Pallikarini wetland will certainly bring back life to water bodies.

Example - Revival of Alwar river in Alwar dist. Of Rajasthan by Rajendra Singh (water man of India). He helped to build ~9000 Johads, Check dams.

India had joined "Bonn Challenge" a global effort to bring 150 million hectares of the world's deforested and degraded land into restoration by 2020, and 350 million hectares by 2030.

India pledged to bring into restoration 13 million hectares of degraded and deforested land by 2020, and an additional 8 million hectares by 2030.

At COP 14 of UNCCD India raised the Target of 21 million hectares to 26 million hectares between now and 2030, to be restored.

Other Steps by India

- Desert Development Programme.
- Integrated Watershed Management Programme which is now subsumed under Pradhan Mantri Krishi Sinchai Yojana.
- National agriculture policy 2000
- National Mission on Green India which is a part of National Action Plan on Climate Change.
- National Afforestation Programme.
- Soil Conservation in the Catchment of River Valley Projects and Flood Prone Rivers.
- National Watershed Development Project for Rain fed Areas.
- Fodder and Feed Development Scheme - a component of Grassland Development including Grass Reserves

- Command Area Development and Management Programme.
- National water policy 2012
- National forest Policy 1988

Conclusion

It is land over which humans are surviving with the help of ecosystem services provided by Flora and Fauna. Degradation of land would mean degradation of human life. Water is becoming scar resource and land degradation is fueling it. Restoration of land provide us the chance to handle water scarcity problem with ease. Hence conservation efforts are necessary along with fast development and urbanisation. It is also enshrined in SDG 15. Development without sustainability is worse than on development at all.

The IPCC says total global emissions will need to fall by 45% from 2010 levels by 2030 and reach net zero by 2050. In this context, elaborate how differential carbon tax would be able to finance climate mitigation strategies across the world?

The hindu

Climate change is a global problem, and a global problem needs a global solution. The most recent Intergovernmental Panel on Climate Change (IPCC) report suggests that we, as humankind, might have just over a decade left to limit global warming.

The IPCC says total global emissions will need to fall by 45% from 2010 levels by 2030 and reach net zero by 2050. If these targets are not met, tropical regions of the world, which are densely populated and happen to be mainly concentrated in the global South, are likely to be most negatively affected because of their low altitudes and pre-existing high temperatures. Some impact of this was already felt during the Tamil Nadu water crisis this year.

Research shows that carbon taxes effectively reduce greenhouse gas emissions. There is overwhelming agreement among economists that **carbon taxes** are the most efficient and effective way to curb climate change, with the least adverse effects on the economy.

Benefits:

- The burden of impact is shared in a just manner among the countries
- Example - most of the carbon emission was done by countries of the north USA, China, and UK etc. But the most IMP acted are tropical countries (Samoa Maldives Congo Nigeria)
- These countries do not have enough resources to switch to green technology to get to lower the emission level
- To fulfill the emission target Global contribution will be necessary. At the same time burden of adjustment must be in proportion to contribution in Global emission.

Advantages of having Global carbon tax:

- Countries emitting more than that of global average per capita emission will pay. The tax, countries that are emitting less than Global average will receive money from the tax paid.

- The tax paid and received will be in proportion to the distance of national per capita emission from global average per capita emission.
- Under this tax those countries that have brought down their per capita emission will also get sum from the tax pool. Example France and UK who earlier contributed much to Global emission will be in the list of 135 country who are the receivers too, because they have brought down their per capita emission.
- The tax wants the entire nation to climb down the mission ladder without necessarily having to give up on their standard of living.

Conclusion

Global warming is a concern for survival on earth Global partnership on equitable basis is necessary to award global warming some of the method for doing this are global carbon tax on principle of Common but differential responsibility.

“Economic diversification is imperative to cope with climate crisis”, justify the statement with suitable examples.

[Downtoearth](#)

Why this question:

The article deals in detail as to in what way climate crisis can be addressed better if economies are diversified.

Key demand of the question:

One must discuss the significance of diversification of economy and its impact on mitigating the climate crisis facing the world.

Directive:

Justify – When you are asked to justify, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question using suitable case studies or/ and examples.

Structure of the answer:

Introduction:

Explain what you understand by climate crisis.

Body:

Explain that the Developing countries dependent on commodities need to diversify their economies to mitigate the increasing climate change risks and achieve the United Nations-mandated Sustainable Development Goals (SDGs), according to a new report by the UN Conference on Trade and Development (UNCTAD).

Explain what are the possibilities and in what way Climate crisis poses an existential threat to commodity-dependent developing countries and will result in the collapse of some economies if decisive action is not taken now.

Conclusion:

Conclude with way forward.

Economic diversification is the process of shifting an economy away from a single income source toward multiple sources from a growing range of sectors and markets. Traditionally, it has been applied as a strategy to encourage positive economic growth and development.

In the context of **climate change adaptation**, it takes on a new relevance as a strategy to diversify away from vulnerable products, markets, and jobs toward income sources that are low-emission and more climate resilient.

While natural disasters like heatwaves, floods, hurricanes, rising sea levels and increase in sea surface temperature destroys agriculture, affect crop yield and fish production; extreme weather events lead to destruction of infrastructure, affecting the profitability and attractiveness of projects.

Impact on natural resource

These disasters can also lead to ‘physical stranding’ of natural resources, rendering them impossible and unprofitable for use, the report said.

These would adversely affect the commodity-dependent developing countries (CDDCs), especially those who are highly dependent on these resources for their economic well-being.

Further, in the race to limit greenhouse gas emissions, some natural resources in the energy sector also face the problem of ‘regulatory stranding’. The best example is the use of coal, which is increasingly being reduced and eliminated as the primary energy source.

With renewable energy, especially solar energy, becoming cheaper, there would be a shift towards them. Thus, even without regulatory stranding, the thermal power stations would become economically unattractive, the report said.

China, the world’s largest importer of commodities, has resolved to increase the share of non-fossil fuels in the country’s primary energy consumption, as part of its commitment to climate change mitigation. This would impact the exporters of fossil fuels to China, resulting in revenue loss in export market. They would also face problems in finding alternative and profitable markets.

Angola, for example, the largest African exporter of oil to China, would be the hardest hit. In 2017, 47 per cent of its total merchandise export revenue was oil exports to China.

Why should the economies be diversified?

Sectors such as tourism, agriculture, fisheries, forestry and energy production are all sensitive to the adverse effects of climate change.

The negative impacts of climate change on these sectors are of concern to all countries, especially for those whose economies are primarily driven by climate sensitive sectors. In this context it is imperative for all countries to diversify their economies either by expanding climate sensitive sectors or by promoting adaptation measures that increase resilience within the sector.

Economic diversification is one component of economic resilience and is also a key component of sustainable development as it will assist countries in reducing poverty and generate employment in the long run.

In order to eradicate extreme poverty, there needs to be an economic transformation towards sustainable development. This transformation needs to be supported institutions, incentives and investments and is an essential factor in adapting to changing conditions.

Recently, *UNDP’s supports in pursuing economic diversification strategies have been employed in a wide range of sectors. Tourism, agriculture and energy are a few examples.* These efforts are about shifting strategies to respond to emerging climate changes and to develop systems that are resilient yet sufficiently flexible that they enable people to respond to change.

Conclusion:

Climate crisis poses an existential threat to commodity-dependent developing countries and will result in the collapse of some economies if decisive action is not taken now. Now, more than ever before, these countries need to assess their diversification potential and reduce their commodity dependence, which for decades has kept them exposed to volatile markets and climate change.

At a time when we are looking for traces of water in search of life on the moon, we should give greater importance to conserving water on earth. Comment on the statement with emphasis on need for a people's movement to conserve water

pib

Why this question:

The question intends to discuss the urgency of water conservation through an effective people's movement.

Key demand of the question:

One must discuss the need to encourage people's movement to overcome and face the water crisis facing the country.

Directive:

Comment – here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Discuss in short the looming crisis scenario of water.

Body:

Explain in what way people's participation – a Jan Andolan and holistic approaches are crucial to ensure the success of schemes and policies addressing the water crisis currently witnessing the country.

Suggest solutions to address the crisis, what should be the way forward, in what ways one can address the various issues leading to water scarcity.

Conclusion:

Conclude with solutions and emphasize on the need of Jal Andolan.

Clean, fresh water is a limited resource. With all the severe droughts happening in the world, the limited supply of fresh water is becoming one of our most precious resources. Every person on earth needs water to survive. Without it, many of us would get sick and even result in death.

While almost 70% of the Earth is made up of water, many parts of the world suffer from clean water shortage. Conserving water is important because it keeps water pure and clean while protecting the environment.

Conserving water means using our water supply wisely and be responsible. As every individual depends on water for livelihood, we must learn how to keep our limited supply of water pure and away from pollution. Keeping our water supply safe and pure will protect the water for the generations to come.

Availability of Water in India

- India receives an average rainfall of about 1170 mm which corresponds to an annual precipitation of about 4000 BCM (Billion Cubic Meter) including snowfall.
- However, there is considerable variation in rainfall both temporally and spatially.

- Nearly 75% of this i.e., 3000 BCM occurs during the monsoon season confined to 3 to 4 months (June to September) in a year.
- On the one side, there are surplus states like Uttar Pradesh, Himachal Pradesh and on the other side, there are water scarce states like Maharashtra, Karnataka, Tamil Nadu, Rajasthan and parts of Gujarat.
- Also, some states that are called as water abundant states like Punjab, Haryana have their own problems.
- After accounting for evaporation, the average annual water availability in the country has been assessed as 1869 BCM.
- It has been estimated that owing to topographic, hydrological and other constraints, the utilizable water is 1123 BCM which comprises of 690 BCM of surface water and 433 BCM of replenishable ground water resources.

Challenges of Water Management

- Less pre-monsoon rainfall and delay in monsoon combined with unprecedented heat make it difficult to control the supply of water in the country.
- The stress on water will increase with rise in population, in that case, managing the demand for water, will become difficult.
- India is now facing a water stressed situation. Globally, the standard for water-stress situation is 1700 cubic metres of availability of water per person. India, at present, is just below that.
- India is not yet facing that situation which is globally called as water-scarcity situation.
- At the time of independence, the availability of water in the country was around 5,000 cubic metre per capita per annum, higher than what was required then. Over the time, India has failed to develop that extra availability.
- The groundwater in most of the parts of northwestern India is now available at 100 metres below the ground. With the present rate of extraction, in future, the groundwater will be available at 200 or 300 metres below the ground.
- Level of water in the reservoirs is going down. At present, the 91 reservoirs that Central Water Commission (CWC) monitors are around 19% of their life storage.
- Recently, in some states, area under water intensive crops like rice and sugarcane has increased. This is linked with the procurement and pricing policy of the government. It so happens that owing to the higher production of such crops, the government offers several benefits; this tempts other farmers as well to grow such crops, thus creating a vicious circle.
- The participation of individuals, NGOs and different communities in the water management process is quite missing.
- The role of the Jal Shakti Ministry is quite limited in handling the water crisis situation in the country until the participation of people is there for using the water prudently, for switching from the crops which are water intensive to the crops that are less water intensive.

- Due to climate change, India in the near future will witness an increase in hot spells, change in rain patterns, thus, the problem of frequent floods and frequent droughts.
- The Groundwater (Sustainable Management) Bill, 2017 drafted by the Ministry of Water Resources, River Development & Ganga Rejuvenation that provides new bases for regulating groundwater as a public resource and measures at aquifer level, has been forgotten.

Steps Taken by the Government in this direction:

- Across the country, states are taking the lead. In Rajasthan, there is a scheme called 'Mukhya Mantri Jal Swavlamban Abhiyan'. One of its objectives is to ensure effective implementation of water conservation and water harvesting related activities in rural areas.
- Maharashtra has launched a project called 'Jalyukt-Shivar', which aims to make 5000 villages free of water scarcity every year.
- The Telangana government has launched a mission called Mission Kakatiya, the objective of which is to enhance the development of agriculture based income for small and marginal farmers, by accelerating the development of minor irrigation infrastructure, strengthening community based irrigation management and adopting a comprehensive programme for restoration of tanks.
- Concerned about the water crisis in rural areas, the Prime Minister of India has recently written a personal letter to 'gram pradhans' (village chiefs) requesting them to conserve rainwater during the forthcoming monsoon.
- The Prime Minister has recently also said that the government will ensure piped drinking water to every household in the next five years. It seems to be one of the most ambitious projects that are taken in the last few decades.

Interlinking the Rivers

- The Interlinking River Project is a long term project. If one considers, the Ken-Betwa Linking project, the MoU was signed 20 years back and the groundwork on the project has not started yet.
- There always remains a lot of political opposition to the 'Interlinking the Rivers' project.
- It is so that the northern states face the situation of flood at the time of monsoon and water is required by the southern states in the dry months. Whether the project will be able to solve this problem or not is a matter of concern.
- Interlinking the rivers has its own ecological disadvantages, like in the case of the Ken-Betwa project; half of the Panna Tiger Reserve will get submerged. Also, there will be huge displacement of people. The cost involved is quite high, this raises the questions over its usefulness.
- Localized water conservation efforts, instead, is a solution. 20-25% of the water bodies, that can easily supply water to the local population, have damaged in the last 50 years. With the help of local communities, water bodies in a particular region can be easily managed.

Suggestions:

- Time has come for India; it needs a rigorous program on water efficiency as it has on energy efficiency. Just the way, India has a star-setting system for energy using appliances; it needs to have the same sort of setting for water using appliances.
- Managing the demand side of water management is crucial as India cannot increase the per capita availability of water.
- At present, the geography of water is quite different from the political geography of the country. India needs mechanisms which bring relevant people together.
- For instance, ground water, today, is the biggest single source of irrigation. It has even outweighed the surface irrigation. India has no system of coordination amongst users of the given aquifers, though it has started mapping its aquifers.
- There are countries where there is a law that states that if a number of people are sharing an aquifer, then such people must have a contract on how much each of them can draw.
- Almost all major rivers in the country are shared between the states and perhaps, it is premature to expect that the states will surrender their authority over the river basins in their respective territories. But, at least, they can come together for coordination over the river basins and sharing the relevant information. The Central Government can play a major role in bringing the states together.
- The country needs to have a specific plan for water-stressed states. There will be more efficient usage of water especially in the rural areas if the government starts charging for its water service on the lines of its electricity supply service. But the Government needs to ensure that it has the proper infrastructure to supply water to the houses.
- The government needs to encourage local participation for conserving water in the country. Hiware Bazar is a good example.
- Hiware Bazar, a village in Maharashtra's drought-prone Ahmednagar district, was sliding into an abyss after its environmental degradation. But in less than a decade it turned itself around into one of the most prosperous villages of the country. It used funds from government schemes, to regenerate its natural resources--forests, watershed and soil--led by a strong village body. The village very well manages the 300-400 millimeters (mm) of rainfall that it receives every year.
- Incentive based water conservation in rural parts in the water stressed areas is another solution, for example, if a particular level of groundwater level is maintained, higher MSP can be provided to the farmers of that region.
- Water-use efficiency in agriculture can be ensured by making farmers aware and by providing them, on the ground, technologies like the one related to water resistant crops.
- In-situ water conservation techniques like rain water harvesting, check dams need to be continued.

For the time being, there is a need to design and develop around water management. Also, water management needs to be the central focus of efforts in the agriculture sector and the environment improvement. Right water management will lead to right land management, health management and education management.

The Government needs to holistically handle the supply as well as the demand side of water management and everybody in the society, i.e. the central government, the state governments (water, being the state subject), citizens, NGOs and companies need to come together to tackle water crisis in the country.

With funding from developed nations barely a trickle, India and other developing nations must take hard calls on growth vis-a-vis climate change action. Discuss.

Financialexpress

Why this question:

The article details upon the climate call made by India ahead of United Nations Climate Action Summit. It also discusses the discussion paper titled Climate Summit for Enhanced Action: A Financial Perspective from India released by the government of India.

Key demand of the question:

One has to explain the need for reinvented funding mechanisms to deal with climate change action.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief discuss the context of the funding mechanisms presently in action for dealing with climate change.

Body:

Explain that with funding from developed nations barely a trickle, India and other developing nations must take hard calls on growth vis-a-vis climate change action. India, thus, has said that it will 'suitably recalibrate' its action only after the global stock-take of progress under the Paris Agreement takes place in 2023. While global climate negotiations have focused on the principle of common but differentiated responsibilities, and countries' respective capabilities—this acknowledges the fact that developed countries have shrunk the emissions budget for developing nations—the fact is that developed nations gave just \$38 billion in climate finance in 2016, against the \$100 billion a year by 2020 that had been agreed to in the 2009 climate negotiations.

Conclusion:

Conclude with Unless developing nations force their developed counterparts to change course, the climate agenda would fail, with devastating consequences for all.

Climate change is certainly without argument the most serious global environmental crisis that we face. It is not the only environmental problem, but it is unique in its multi-scalar characteristic, from the global to the local. And, in many ways, it is arguably the most immediate of our problems.

At one level, for many people climate change has become an existential problem, a problem that risks undermining the conditions for productive life and therefore a problem that does not override but certainly permeates all kinds of other issues. For many others, climate change is a distant problem that is overwhelmed by more immediate issues.

With funding from developed nations barely a trickle, India and other developing nations must take hard calls on growth vis-a-vis climate change action. India, thus, has said that it will 'suitably recalibrate' its action only after the global stock-take of progress under the Paris Agreement takes place in 2023. While global climate negotiations have focused on the principle of common but differentiated responsibilities, and countries' respective capabilities—this acknowledges the fact that developed countries have shrunk the emissions budget for developing nations.

Though India is not responsible for the stock of CO₂ in the atmosphere, we must do far more than we are doing today to call the developed countries to account.

India contributes to only 6 or 7% of global emissions but we are one of the most vulnerable countries.

Adaptation and Mitigation:

We need to start taking climate change more seriously, particularly on the adaptation side, because we really have a lot to be concerned about.

And on the mitigation side, we have to be careful as we may not be fully exploring the scope of intersections between 'a low carbon agenda' and 'a development agenda'.

India still has huge development deficits and unfortunately, the intersection between erasing development deficits and genuine climate change adaptation has been very poorly explored and the entry point for this conversation should be development deficits.

This is because 'development is the first line of defence against adaptation'.

In adaptation, our focus should therefore be on understanding what our development deficits are.

For example, to say that we need to improve, find a way for cleaner transportation, shouldn't actually lead to a conclusion that it should lead to more electric vehicles – the first priority has to be improved and more accessible public transport.

We need to understand these development deficits from a multi objective point of view, in terms of economics and access, in terms of local pollutants like air pollutants, climate change and mitigation, and liveability of cities, we need this more multi-faceted and analytical framework.

India can bring development gains and that also lead to mitigation benefits.

For example, the way we design our cities: we want more sustainable cities, we want cities with less congestion, with more public transport because we want cities that are more liveable. Those kinds of cities will also automatically be low carbon cities.

Discuss the scientific consensus on the causes and consequences of climate change and also while Science, experience and public alarm are increasingly on the side of action, the national politics in most of the countries are moving in opposite direction. Critically examine.

[The hindu](#)

[Indianexpress](#)

Why this question:

The article deals with the happenings around the recently convened global Climate Action Summit.

Key demand of the question:

One has to analyse in detail the scientific consensus on the causes and consequences of climate change and in what way the climate diplomacy needs to be put in place and set in the right orientation.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the context of the question.

Body:

Discuss that the most scientists agree that the climate changes caused by global warming will never be completely predictable, but that they present serious risks—more extreme temperatures (hot and cold), greater storm intensity and frequency, more frequent droughts and floods, and rising sea levels—that warrant immediate efforts to reduce emissions from fossil fuels

Explain then what role does human activity play in the current global warming trend? What are effects of it and how should it be tackled.

Conclusion:

Conclude by suggesting short term and long term solutions for the same.

This summer saw Delhi-like temperatures across southern Europe; Hurricane Dorian rendered large parts of the Bahamas unlivable; witnessed simultaneous raging fires in the Amazon, central Africa and even Siberia. Heat wave in France and Germany. Still, concentrations of carbon dioxide continue to rise. Citizen Protests: The growing evidence of climate change — scientific and experiential — has pushed the global youth into social action.

While more noticeable in the global North, young people are also mobilizing in India and other countries in the global South against inaction on climate change around the world.

These aspects could have pressurized the national politics in country into climate action but, the trend is opposite of what is required. Nationalism in multiple countries has created a short-term, look-out-for-our-own mentality to address climate change. In the United States, President Donald Trump has actively rolled back measures in the electricity sector and actions to limit methane emissions in the name of competitiveness. In Brazil, President Jair Bolsonaro has made it clear he sees environmental protections as limiting Brazilian business.

In this background, will UN Summit bring any changes?

The Secretary-General is pinning hopes on a two track approach.

Diplomatic pressure: to enhance their pledges for action made as part of the Paris Agreement. But, the response is underwhelming. Accelerating energy transition towards low-carbon energy.

What does this canvas of global climate politics mean for India?

First, that the prospects of effective global action required to address climate change are so weak is extremely bad news for India.

Second, India has the potential to show the pathway to accelerating action on climate change even while pursuing its development interests.

Third, such a domestic message would position India to be a true global climate leader, rather than a leader only among climate laggards.

Conclusion:

Make accelerated climate action congruent with an enlightened notion of national interest by focusing on key actions in rapidly changing areas such as energy and urbanization.

The increase in global temperatures and the associated natural disasters will make millions of people climate refugees. Analyse the statement in the light of recently released IPCC report on Ocean and Cryosphere and suggest the way forward.

Indianexpress

Why this question:

The latest report, on Ocean and Cryosphere, is the last in a series of three that the IPCC had been asked to produce to assess the impacts of climate change on specific themes.

Key demand of the question:

The answer should bring out the highlights of the latest IPCC report and significance of the urgency to curb global warming to mitigate the effects of climate change and disasters occurring due to it.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In brief explain how the recent report has given further strength to growing demands for more aggressive climate action from world leaders, especially those representing the big emitters.

Body:

Explain that the latest report, on Ocean and Cryosphere, is the last in a series of three that the IPCC had been asked to produce to assess the impacts of climate change on specific themes. The first of these, examining the feasibility of restricting global rise in temperatures to within 1.5°C from pre-industrial times, was submitted in October last year.

Discuss the highlights of the report in detail.

What are the issues and challenges world is facing on climate front? And what should be done to overcome?

Conclusion:

Conclude with way forward.

Recently the Intergovernmental Panel on Climate Change (IPCC) made public ‘**The Special Report on the Ocean and Cryosphere in a Changing Climate**’ which underlined the dire changes taking place in oceans, glaciers, and ice-deposits on land and sea at the United Nations Climate Summit underway in the United States. Climate change impacts on homes and infrastructure, food and water and human health. It will bring about a forced migration on an unprecedented scale.

Key Findings of the Report:

- Over the 21st century, the ocean is projected to transition to unprecedented conditions with increased temperatures, further ocean acidification, marine heat waves and more frequent extreme El Niño and La Niña events.
- Ocean Warming: Global Ocean has warmed unabated since 1970 and has taken up more than 90% of the excess heat in the climate system.
- Since 1993, the rates of ocean warming and marine heat waves have very likely doubled in frequency and intensity.
- Global Mean Sea-Level: It has increased by 16 cm between 1902 and 2015, and that the rate of increase had doubled of late.

- Between 2006 and 2015, the global mean sea level recorded an average rise of 3.6 mm per year, which was more than double of 1.4 mm per year recorded in the first 90-year-period of the 20th century.
- Sea-level rise is not globally uniform and varies regionally. Regional differences, within 30 % of global mean sea-level rise, result from land ice loss and variations in ocean warming and circulation
- The Melting of Glaciers: Between 2006 and 2015, the Greenland ice sheet lost ice-mass at an average rate of 278 billion tonnes every year (e.g. Okjokull glacier of Iceland), which was enough to result in a global sea-level rise of 0.8 mm per year. During the same period, the Antarctic ice sheet lost a mass of 155 billion tonnes on an average every year.
- Snow cover outside these two poles, like the glaciers in the Himalayas, together lost an average of 220 billion tonnes of ice every year.
- The melting glaciers are the dominant source of sea-level rise, exceeding the effect of thermal expansion of ocean water (due to rising temperatures).
- Since the mid-20th century, the shrinking Cryosphere has led to predominantly negative impacts on food security, water resources, water quality, livelihoods, health, and well-being, as well as the culture of human societies, particularly for Indigenous peoples.

Climate-related displacement and migration is set to be the greatest challenge of our era. While there is a general consensus that global warming impacts us all, the role it will play in future human migration is often underestimated. Climate change disproportionately impacts developing countries, and more specifically fragile states.

Communities in arid and semi-arid lands are particularly vulnerable to the effects of climate change. Exposure to extreme temperature irregularity and rapid rainfall fluctuations makes these communities more prone to recurring drought or flooding.

What needs to be done?

Creating innovative finance mechanisms - The current humanitarian finance system is reactive and in desperate need of reform. As humanitarian crises become more complex, the demand for funding is struggling to keep up with the supply available.

The global humanitarian funding requirement for 2019 was a record \$21.9 billion and is expected to increase further. By 2030, humanitarian assistance costs are estimated to almost double in one decade by rising to an annual rate of \$50 billion, if current trends continue.

The issue is that, as crises become more protracted, the coordinated response rate also rises. According to the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), the average UN coordinated humanitarian response rate is currently nine years – this is up from the average length of 5.2 years recorded in 2014.

With the continuation of crises, multi-year funding is needed to help close the gap. The scope for non-traditional innovative sources of finance is enormous. Creating financial solutions to reach more of those at the bottom of the pyramid would be a major contribution to addressing this pressing issue and helping build local resilience.

In the past couple of years, we have had green bonds that have been issued globally to fund climate-friendly projects and, more recently, a humanitarian impact bond that helped fund the building and operation of physical rehabilitation centres in Nigeria, Mali and the Democratic Republic of Congo. Why can't we have a financial instrument, embedded with humanitarian principles, that addresses climate-induced humanitarian problems?

Prioritizing gender- Climate change induced migration is adding a new layer of complexity to the area of gender, as women and girls are more vulnerable to the effects of climate change impacting education, maternal health and gender-based violence. In cases of climate change disasters, such as droughts, girls are more likely to be withdrawn from school, as women and girls are often in charge of water collection. In Africa alone, it is estimated that 17 million women and girls collect water every day.

With climate change disrupting their education, young girls are reportedly being taken out of school to marry early, creating a worryingly higher number of "child brides". The repercussions have a profoundly negative impact on a young girl's mental, physical and overall wellbeing.

As for health, 60% of all preventable maternal deaths take place in settings of conflict, displacement or natural disasters, because women and adolescent girls cannot access critical health care.

Furthermore, in situations of climate change disasters, there is clear evidence that shows an increase in sexual and gender-based violence against women and girls both during and after disasters.

The time has come to integrate a gender perspective into the climate change agenda by putting women and girls at the centre of design and decision-making. Gender-sensitive policies must be identified and prioritized to help build resilience to climate-induced disasters.

Disaster and disaster management.

The recent Godavari boat tragedy underlines the negligence on part of various government agencies of the state of Andhra Pradesh who failed to follow the safety mandate suggested. Critically examine.

The hindu

Why this question:

As many as 12 people died on Sunday afternoon when a tourist boat carrying 61 persons on board capsized in the Godavari River near Devipatnam in Andhra Pradesh.

Key demand of the question:

The answer must address the underlying causes of the incidence and bring out the lacunae on the part of the government efforts to ensure safer travels across the river despite known possibilities and risks associated.

Directive:

Critically examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgement.

Structure of the answer:

Introduction:

In brief narrate the background of the incident.

Body:

First explain why the incident occurred.

What were the lacunas on part of the government – Though the boat has license, it was not yet clear whether it had the required permission to ferry tourists since all boat operations in the river have been prohibited because of the flood.

Explain that River Godavari has been in spate for the past few days and over 5.13 lakh cusecs of floodwater was flowing.

Explain that Despite frequent boat accidents in the Godavari and Krishna rivers claiming several lives, no precautionary measures are being taken to prevent them.

Conclusion:

Conclude with solutions that should be provided urgently both in short term and long term to address the situation.

A boat capsized recently in the Godavari leaving many dead and missing. The state of Andhra Pradesh has been experiencing a familiar ring of boat tragedies in the recent past.

In the latest boat tragedy on the Godavari in which some tourists drowned and others still missing. The private operator took on board over 70 tourists who were hoping to see the scenic beauty of Papikondalu. The operator ventured into the river that has been in spate for days, without any permission.

The inexperienced crew could not cope with a sudden current of water at Kachuluru, one of the most dangerous spots enroute.

The boat tilted and capsized within minutes and only those wearing life jackets could save themselves.

The Andhra Pradesh government announced a hefty ex-gratia, promises deterrent action against all those responsible and initiates steps to prevent such tragedies.

Facts about the past tragedies:

- Police records show over 100 people perishing in boat mishaps during the last three years.
- The major one being on the Krishna in November 2017 when 22 tourists lost their lives.
- These tragedies were avoidable if simple precautions were in place like,
- Having only experienced crew with valid licenses,
- Provision of life jackets for all,
- Not setting out when the river is in full flow.

Were any lessons learnt from these recurring mishaps?

- The accident on the Krishna jolted the N. Chandrababu Naidu government into action and a committee was formed to formulate preventive steps.
- The committee highlighted the multiplicity of the departments concerned ranging from irrigation to director of ports with permitting rides and monitoring and checking illegal ones.
- It pointed to lack of coordination. Eg: When the river touches the danger mark, the irrigation department should send out a warning to all concerned not to allow any rides.
- Without a single regulatory body, the result was this typical bureaucratic phenomenon of passing the buck.

- The committee suggested making the directorate of ports as a nodal agency and the AP Inland Vessel Rules were brought into effect.

To prevent such man-made tragedies, the government must pin responsibility on officials instead of resorting to mere palliative steps.

Linkages between development and spread of extremism.

Global Co-operation and intelligence-sharing have become quintessential to fight the new age terrorism which has global reach and sophisticated tools at its disposal.

Discuss.

[Newindianexpress](https://www.newindianexpress.com)

Why this question:

Defense minister Rajnath Singh recently suggested that bio-terrorism is among new threats facing Armed Forces, at the Medical Services of SCO countries. He called on them to find effective ways to deal with new threats posed by advancing battle field technologies.

Key demand of the question:

The question intends to examine the changing techniques and tools of terrorism with coming of technology and rising expanse of terrorism.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain why terrorism is becoming a difficult domain to handle day by day.

Body:

First discuss what factors are making terrorism so dynamic – coming of newer technologies, newer techniques of warfare etc.

Then explain the urgency of the global community to come together to tackle the menace.

Quote examples such as that of bioterrorism and how one can handle the threats arising from it.

Conclusion:

Conclude with what actions should countries across the world should take and what should be the way ahead in future.

With advancement in technology the nature of globalization has changed from traditional to new forms. New forms of terrorism are emerging which is acquainted with the use of new technology. New age of terrorism is spread through network of loosely connected cells and support groups.

Different faces of terrorism:

- **Religious fundamentalism** - terror attacks motivated by the religion or class of Civilization theory. Example Isis are Islamic Fundamentalist
- **Biological and chemical terrorism** - includes use of Biological agent like virus bacteria fungus are chemical agents like Agent Orange etc.
- **Loan wolf attack** - using social media loan words are prepared by terror groups to attack.
- **Cyber terrorism** - large scale destruction of computer network using computer virus like stuxnet.

- Nuclear weapons and other mutually destructive weapons

Why new-age terrorism is difficult to fight?

- Globally spread through sleeper cells network rather than local groups
- There is no consensual definition of terrorism in the international convention to combat terrorism
- Multiplier effect and attraction of used to it apps and website that trigger religious.
- Terrorist groups are exploiting conflict zones and ungoverned territories to find new recruits.
- Pakistan occupied Kashmir is a major terror hub for Jaish-e- Mohammed.

Solution

- Hamburg statement in G20 summit on combating terrorism and Allianz the need for International cooperation in intelligence sharing.
- All countries should proportionately contribute to fund International investigative Agencies like Interpol
- Public private partnership- particularly with communication service provider and administration of various social media platform like WhatsApp Facebook.
- Efficient implementation of decisions of financial action task force car financing of terrorism.
- Bilateral and multilateral agreements am at sharing Intelligence and security inputs. Example India has provided security alert before the Easter bombing in Sri Lanka
- Strengthening sanitary and phytosanitary laws under WTO to prevent bioterrorism

Conclusion

Terrorism in developing country is a menace to the social economic and political development. Given the Global expense it can only be detected by forging anti-terrorism Alliance on a global scale.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention

What is Darknet? Are Dark Web and Deep Web one and the same? Discuss in detail the associated concerns of the same.

The hindu

Why this question:

The Kerala police have set up a state-of-the-art lab complete with enabling software to intervene and crack down on the rising criminal activities over the Darknet, known as the underworld of the Internet.

Key demand of the question:

One has to clearly explain the concepts of Darknet and Deep Web. Explain in what way the two are different from each other.

Directive:

***Discuss** – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.*

Structure of the answer:

Introduction:

In brief define what is DarkNet.

Body:

Explain in detail that Dark Net is an umbrella term describing the portions of the Internet not open to public view or hidden networks whose architecture is superimposed on that of the Internet and on the contrary Deep Web is the area of the Internet which is not accessible through search engines. What can be accessed through search engines is called Surface Web.

Discuss in depth the concerns associated with the two.

Conclusion:

Conclude with way forward.

- Dark Net (or Darknet) is an umbrella term describing the portions of the Internet not open to public view or hidden networks whose architecture is superimposed on that of the Internet.
- Darknet provides anonymity to the users.
- Darknet is often associated with the encrypted part of the Internet called Tor network where illicit trading takes place such as the infamous online drug bazaar.
- A variety of Darknet markets (black markets) allow for the anonymous, illegal buying and selling of drugs and other illegal or controlled substances, such as pharmaceuticals, and weapons.
- The services and websites running on the Darknet is the dark web.

Are Dark Web and Deep Web one and the same?

- Deep Web is the area of the Internet which is not accessible through search engines. What can be accessed through search engines is called Surface Web.
- To get into the Deep Web one should know the right address.
- Dark Web is part of the Deep Web.
- While the Deep Web is accessible, the Dark Web is deliberately hidden.
- While incognito mode disables browsing history and web cache, the Dark Web is shielded by specialised software.
- Since the real world money trail carries the danger of exposure, Dark Web operators transact in virtual currencies, the most popular being Bitcoins.

What are the concerns involved?

The relative impermeability of Darknet has made it a major haven for drug dealers, arms traffickers, child pornography collectors and other criminals involved in financial and physical crimes so much so that one can buy anything from tigers to hand grenades to any kind of narcotic substances, provided the potential buyer finds the right website on the Darknet.

Details:

- Kerala Cyberdome is a technological research and development Centre of Kerala Police Department conceived as a Cyber Centre of excellence in cybersecurity as well as technology augmentation for effective policing.
- The Kerala police have set up a state-of-the-art lab complete with enabling software to intervene and crack down on the rising criminal activities over the Darknet, known as the underworld of the Internet.
- A pool of four analysts has been trained and deployed in shifts for round-the-clock monitoring of Darknet.
- Since the expertise for imparting training in tracking the Darknet is limited in the country, the analysts were given 14-day training by roping in an expert from Israel.

INSIGHTSIAS

SIMPLIFYING IAS EXAM PREPARATION

SECURE SYNOPSIS

MAINS 2020

GS-III

OCTOBER 2019

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

If the government is serious about Make in India for APIs and boosting R&D spending by pharmaceutical companies, it must shun price controls as a policy measure. Discuss measures required to be taken by the government in augmenting the Pharma sector. (250 words)

Financialexpress

Why this question:

The article captures that the government is mulling over excluding medicines made from locally manufactured active pharmaceutical ingredient (API)—the key raw material for the production of a drug—from price control. The move, according to a Mint report, is aimed at pushing manufacture of APIs in India to reduce import dependence.

Key demand of the question:

One has to discuss in depth the need to do away the price controlling policies by the government with respect to APIs in the pharma industry so as to boost the Make in India drive for the sector.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define what APIs are.

Body:

Discuss the context of the question as to what steps the government is trying to take.

Explain in what way the price control was affecting domestic manufacture of pharma products.

Discuss the nuances of Draft Pharmaceuticals Policy 2017,

Justify that if the government is serious about Make in India for APIs and boosting R&D spending by pharmaceutical companies, it must shun price controls as a policy measure. To keep medicines affordable for the masses, it must subsidize through bulk purchases for its Jan Aushadhi and other outlets.

Conclusion:

Conclude with way forward.

Introduction:

The government is mulling over excluding medicines made from locally manufactured active pharmaceutical ingredient (API)—the key raw material for the production of a drug—from price control. The move is aimed at pushing manufacture of APIs in India to reduce import dependence. The move if implemented and to the desired effect, would be a boost for Indian pharma.

Body:

Issues facing the Pharma industry:

- **Overdependence:** Indian pharma industries import about **80% of Active Pharmaceutical Ingredients (API) from China**. The API forms the base of drugs. With trade-wars at global levels and wavering bilateral relations, there is a looming threat which can stall the Indian pharma industries. In FY19, Indian pharma companies **imported bulk drugs and intermediates** worth \$2.4 billion from China.

- **Compliance issues and good manufacturing practices:** Diversifying the global market has been a problem with countries China and USA imposing Sanitary and Phyto-Sanitary (SPS) barriers of WTO against generic drugs. The selective targeting by US Food and Drug Administration and Chinese Drug regulators are a problem still.
- **Drug Price Control Order:** The companies sight that the reforms of the Government for the essential medicines has caused them to lower the price of drugs. This has been done by the Government for the betterment of the public.
- **Stronger IP regulations:** IP regulation has always been a thorn in the skin for the companies, especially the foreign companies. The companies strongly feel that the rules have to be amended and the so-called victim of the lax regulations have been the foreign entrants.
- Because of fewer costs associated with generic medicines, multiple applications for generic drugs are often approved to market a single product; this creates competition in the marketplace globally, typically resulting in lower prices. Pharma sector in India is also facing steep headwinds on account of this.
- There is a **lack of proper assessment of the performance** of the pharmaceutical industry and its efficiency and productivity and due to this many plants have not survived.
- **Unregulated online pharmacies or e-pharmacies** emerging in India have been a major concern for authorized setups.
- There has been a significant drop in the flow of prescriptions as the Indian pharmaceutical industry has been witnessing a decline in the overall quality of its medical representatives (MRs). This is mainly on account of lack of training and support by the industry.
- In countries such as Russia, one requires to be a medical graduate to be a pharma sales representative. In the European Union, one needs to pass stringent examinations to become an MR. Once they qualify, they need to renew their certification every three years. But in India, even non-graduates are performing as MRs without proper guidance.

Measures needed:

- India's strong innovation capabilities aided partnerships would help in overcoming these problems.
- Developing our R&D sector to reduce dependency on foreign countries for raw materials
- The introduction of pharmaceutical product patents and the mandatory implementation of good manufacturing practices is the need of the hour.
- It is necessary for the Indian pharmaceutical industry to become globally competitive through world-class manufacturing capabilities, with improved quality and a higher efficiency of production, and there is a need to stress on the up-gradation of R&D capabilities.
- Training and development of human resources for the pharmaceutical industry and drug research and development should be done accordingly;
- There is also a need to promote **public-private partnership** for the development of the pharmaceuticals industry; promote environmentally sustainable development of the pharmaceutical industry; and enable the availability, accessibility, and affordability of drugs.

- Improvement in industrial practices to provide better training and support services for employees to perform their job functions.
- Using multilateral organisation like WTO against the illegal trade practices.
- Funding for the pharma companies might be a way to move forward.
- IPR Think Tank formed by the Government to draft stronger national IP policies.

Conclusion:

The affordability of healthcare is an issue of concern even in India, and people here would welcome some clarity on the principles of fair pricing vis-à-vis medical products. It is important that the accused companies are given a good hearing. The Government of India has taken up a number of initiatives to create an ecosystem that fosters manufacturing in pharma industries.

Is it imperative to focus on agricultural production in devising a long-term solution to the problem of unemployment and the present slowdown in economy? Critically Analyse. (250 words)

The hindu

Why this question:

The article discusses the importance of agricultural production in devising a long-term solution to the problem of unemployment and the present slowdown in economy.

Key demand of the question:

One must establish the significance of agricultural production in devising a long-term solution to address the issues of unemployment and economic slowdown currently being witnessed by the country.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

In brief narrate the agrarian situation in the country.

Body:

In brief, write a note on the role and significance of agriculture in Indian economy. Analyze the performance of agriculture in the last few years. Then critically look into, how emphasis on agricultural production will address the present issues in economy- unemployment and the slowdown.

Conclusion:

Conclude with way forward.

Introduction:

Growth has slowed for the past few quarters, the past two-and-a-half years, if we go by annual growth rates. Globally, industrial growth driven by mindless consumption is the cause of climate change, now unmistakably upon us. According to NITI Aayog, the current economic slowdown is the worst economic slowdown that India has faced since independence. Moreover, the slowdown has been witnessed in consumption in the Indian economy. From many decades, consumption has been the major driver of growth in the Indian economy. Income stagnation has been the cause of consumption slowdown.

**Body:**

Yes, it is imperative to focus n agricultural production due to :

- Rural unemployment is on all-time high.
- Unstable agricultural production first lowers the demand for agricultural labour and, subsequently, its supply, showing up in greater unemployment.
- This affects the investment rate as when non-agricultural firms observe slow agricultural growth, they are likely to hold their investment plans.
- Also, low agricultural export growth, the dismal banking credit, suggest that poor agricultural performance is a significant explanation of slack domestic demand.
- Figures reported in the report of the last Periodic Labour Force Survey point to a dramatic rise in the unemployment rate since 2011-12, when the previous survey on unemployment was undertaken.
- Apart from the category of 'Urban Females', the most recent estimate of unemployment shows that it is the highest in the 45 years since 1972-73. But even for 'Urban Females', it is double what it was in 2011-12.
- For the largest cohort, namely 'Rural Males', in 2017-18, it is four times the average for the 40 years up to 2011-12.
- These figures should convince us of the existence of a grave situation, if not crisis, with respect to employment in the country.

Need for a long term solution:

- Any long-term solution to the problem of unemployment to which the slowing growth of the economy is related must start with agricultural production.
- It has long been recognised that there is a crop-yield cycle related to annual variations in rainfall but we are now witnessing a stagnation.
- We may be experiencing an ecological undertow, and it could defeat our best-laid plans for progress.
- Now, unlike in the case of a cycle, recovery cannot simply be assumed.
- We would need the expertise of agricultural scientists to confirm what exactly is responsible for this state but it would not be out of place to ask if there is not a role for ecological factors in causing agricultural stagnation.
- These factors encompass land degradation involving loss of soil moisture and nutrients, and the drop in the water table, leading to scarcity which raises the cost of cultivation.
- Almost all of this is directly man-made, related as it is to over-exploitation or abuse, as in the case of excessive fertilizer use, of the earth's resources.
- Then there the increasingly erratic rainfall, actually due to climate change entirely induced by human action.

- A deeper adaptation is required to deal with these factors. Intelligent governance, resource deployment and change in farmer behaviour would all need to combine for this.
- It is significant that the reality of an unstable agricultural sector rendering economy-wide growth fragile has not elicited an adequate economic policy response.
- Policy focus is disproportionately on the tax rate, the ease of doing business in the non-agricultural sector and a fussy adherence to a dubious fiscal-balance target.
- It is now time to draw in the public agricultural institutes and farmer bodies for their views on how to resuscitate the sector.

Conclusion:

To tackle the unemployment crisis, action will be needed on multiple fronts including investments in human capital, the revival of the productive sectors, and programmes to stimulate small entrepreneurship. The rural picture matters not only because the largest numbers are located there but also because of their low incomes. This means that the future growth of demand for much of industrial production is likely to come from there. The high unemployment rate for 'Rural Males' does suggest that we have zoomed in up to a reasonable degree of precision on the site of low demand. India does need some growth as income levels here are still very low. The problem of low incomes can, however, be tackled even with less growth so long as it is of the appropriate type.

With India facing an economic slowdown, it is a superlative time to instrument agricultural reforms for the restoration of the economy. Analyse. (250 words)

The hindu

Why this question:

One of the world's fastest-growing economies, India, is now facing sluggish growth, with the Reserve Bank of India sharply cutting GDP growth forecast to 6.1% for 2019-20, which is lowest in the last six years.

Key demand of the question:

One has to elaborate that the time is right to execute a slew of doable agricultural reforms as the role of agriculture in reversing the slowdown is immense in the light of its nearly 20% contribution to a \$5-trillion economy.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In brief explain why there is slowdown in the economy.

Body:

Explain the significance of agriculture to the economy in general.

Whatever the reason for the slowdown, the opportunity to speed up must accommodate a diverse body of opinion and options for sustainable and inclusive growth.

The conventional approach of fiscal and monetary stimulus options to address the relics of a slow pace would only give immediate relief and not an enduring solution.

Hence key policy measures as they exist now must reach out to emancipate that which is dragging growth while stimulating key sectors.

The occasional dip in growth due to various reasons will slow the pace to achieving a \$5-trillion economy by 2024.

This is the right time to execute a slew of doable agricultural reforms as the role of agriculture in reversing the slowdown is immense in the light of its nearly 20% contribution to a \$5-trillion economy.

Therefore, a blend of efforts from a range of sectors, agriculture and allied sectors is warranted to enable overall growth.

Conclusion:

Conclude with way forward.

Introduction:

India which was hailed as the '**fastest growing economy**' is now facing sluggish growth, with the Reserve Bank of India sharply cutting GDP growth forecast to 6.1% for 2019-20, which is lowest in last six years; there has been a sharp decline in the performance of key sectors. The conventional approach of fiscal and monetary stimulus options to address the relics of a slow pace would only give immediate relief and not an enduring solution. Hence key policy measures as they exist now must reach out to emancipate that which is dragging growth while stimulating key sectors.

Body:

Current situation of Agricultural sector:

- Real agricultural and allied gross value added (GVA) grew by 2.9% during 2011-12 to 2017-18, while in the National Agricultural Policy (2000), it should have been around 4%, to attain an overall economic growth of 8%.
- A **highly skewed and unprecedented monsoon, erratic rainfall, and extreme natural events** are creating havoc as far as farms and farmers are concerned which in turn are likely to disrupt supply chains, fuel inflation and have a negative impact on consumption, all of which can further dampen the prospects of revival of the economy.
- The current growth rate in the farm sector is less than adequate to take on developmental challenges originating from the Sustainable Development Goals, mainly zero hunger, no poverty, life on land, and gender equality.

Potential of Agriculture sector to revive economy:

- The sector is a potential enabler and employer for more than 50% of the population.
- It also has the potential to revive "animal spirits" by ensuring farm viability: increasing the ratio of farm to non-farm income to 70:30 by 2022-23 from the present 60:40.
- According to the agriculture census 2015-16, the **real income of farmers doubled** in almost 20 years from 1993-94 to 2015-16.

Measures needed:

- The **Agricultural Developmental Council (ADC)** in line with the GST Council is a dire need to make agricultural reforms more expressive and representative.
- For better income distribution, there is also a need to **revisit regional crop planning and the agro-climatic zone model** at the highest possible level
- Promote occupations which are less influenced by the slowdown such as farming, handloom, handicrafts and others.
- There is urgent need to **increase the job-to-investment ratio** which is currently very low.

- Giving a policy nudge to **in-situ employment creation** is a must for a stable income and spending.
- There is a need to reconsider the few distorting reforms that are often stated to revive the short-term chaos in the long run.
- Encouraging public and private investments to develop infrastructure like cold chains;
- Special attention for north-eastern, eastern and rain-fed states for augmenting scope of access to institutional credit;
- Rationalisation and targeting of input subsidies towards small and marginal farmers.
- Reform in land leasing laws to promote land consolidation and contract farming.
- Accelerating the pace of public investment in agriculture and ensure greater efficiency in capital use.
- Loans available through KCC are very low, so the government and RBI should work together to increase the loan amount.
- PPPs could help spur the development of the food processing industry, one of the newest sectors in Indian agriculture.
- present agriculture growth is in declining phase, to revive the agriculture growth need patient capital (as financial returns to investment are unlikely to materialize in the initial years.) like rural infrastructure development fund (RIDF)

Conclusion:

Agriculture and its allied sectors are believed to be one of the most fertile grounds to help achieve the ambitious Sustainable Developmental Goals (SDGs). However, with the current pace of agriculture growth, India requires 'patient capital', as financial returns to investment are unlikely to materialise in the initial years. This is the right time to execute a slew of doable agricultural reforms as the role of agriculture in reversing the slowdown is immense in the light of its nearly 20% contribution to a \$5-trillion economy. Therefore, a blend of efforts from a range of sectors, agriculture and allied sectors is warranted to enable overall growth.

What are Green Skills? Discuss the Importance of Green Skill Development Programme that was launched recently. (250 words)

[Vikaspedia](#)

Why this question:

India would need around 10.4 crores of new workforces by the year 2022, in various sectors and hence skill development is essential to meet the demand. Thus with this aspect the question aims to examine the significance of Green Skill Development Programme.

Key demand of the question:

Explain what are green skills and their importance in today's times. Also throw light on the Importance of Green Skill Development Programme that was launched recently.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define what green skills are.

Body:

Recently Decision has been taken by the Government of India, to expand the Green Skill Development Programme (GSDP) to an all-India level.

Discuss –

What are Green Skills? – Green skills are those skills needed to adapt processes, services and products to climate change and the environmental regulations and requirements related to it. They include the knowledge, abilities, values and attitudes needed to live in, develop and support a sustainable and resource-efficient society. These skills are required in areas such as such as Renewable energy, Wastewater treatment, Climate resilient cities, Green construction, Solid waste management etc.

Explain its significance.

List down the importance of Green Skill Development Programme along with recent developments.

Conclusion:

Conclude with way forward.

Introduction:

Green skills are those which contribute to preserving or restoring environmental quality for sustainable future and include jobs that protect ecosystems and biodiversity, reduce energy and minimize waste and pollution. Realizing the demand for green skilled youth, the Green Skill Development Programme (GSDP) has been conceptualised.

Body:

The Green Skill Development Programme (GSDP) of the Ministry of Environment, Forest and Climate Change (MoEF&CC) is an initiative for skill development in the environment and forest sector to **enable India's youth to get gainful employment and/or self-employment.**

Importance of Green skill Development programme:

- India being the second most populous country in the world is bestowed with a large working population. India has advantage of reaping this demographic dividend.
- Green skilling is crucial for making **a transition from energy and emissions – intensive economy to cleaner and greener production and service patterns.**
- **A Huge gap exists between the need (demand) and availability (supply) of skill sets**, both cognitive and practical, at various levels in the Environment, and Forest sectors in India. However, most of the vocational training programmes focus on mechanical/technical skills rather than 'soft' skills or 'green' skills.
- The Green Skill Development Programme (GSDP) aims to fill this gap. It enhances the employability of people in jobs that contribute to preserving or restoring the quality of the environment, while improving human well-being and social equity.
- GSDP will include **process-based green skills such as, monitoring and managing activities such as waste, energy efficiency, impact minimization and assessment**, etc.
- The programme endeavours to develop green skilled workers having technical knowledge and commitment to sustainable development.

- It will help in the **attainment of the Nationally Determined Contributions (NDCs), Sustainable Development Goals (SDGs), National Biodiversity Targets (NBTs), as well as Waste Management Rules (2016).**
- The number of people to be covered under GSDP will be 80,000 during 2018-19, 2.25 lakh during 2019-20 and about 5 lakh people by the year 2021.
- The skilling programmes cover diverse fields such as pollution monitoring (air/water/soil), Sewage Treatment Plant, Effluent Treatment Plants and Common Effluent Treating Plants (STP/ETP/CETP) operation, waste management, forest management, water budgeting, auditing, conservation of river dolphins, wildlife management, para taxonomy, including Peoples' Biodiversity Register (PBRs), mangroves conservation, bamboo management and livelihood generation.

Conclusion:

With the success of the pilot programme, the next step is to take the skilling programme to an all India level and for all the courses to commence in February 2018. For this, the following steps are required to be undertaken: Identification of New courses based on the demand, Identification of New Institutes with the necessary expertise, and Identification of Employment opportunities.

What is a randomised controlled trial in the context of research that won the Nobel Prize in Economics 2019? Why is it so popular? Explain. Also discuss few criticisms of randomised controlled trials. (250 words)

The hindu

Why this question:

The article provides an in-depth analysis of randomised controlled trials – the method that was used in the research of recently won Noble prize for economics 2019.

Key demand of the question:

One has to explain in detail the concept of randomised controlled trial, reasons for its popularity and criticism if any.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief discuss the origin of randomised controlled trial.

Body:

Explain that the use of randomized controlled trials as a research tool was largely limited to fields such as biomedical sciences where the effectiveness of various drugs was gauged using this technique. Mr. Banerjee, Ms. Duflo and Mr. Kremer, however, applied RCT to the field of economics beginning in the 1990s. Mr. Kremer first used the technique to study the impact that free meals and books had on learning in Kenyan schools. Mr. Banerjee and Ms. Duflo later conducted similar experiments in India and further popularized RCTs through their book Poor Economics, published in 2011.

Discuss the concept in detail, its popularity.

List down criticisms; take hints from the article.

**Conclusion:**

Conclude with way forward.

Introduction:

The new Economics Nobel laureates – Abhijit Banerjee, Esther Duflo and Michael Kremer – are considered to be instrumental in using **randomised controlled trials** to test the effectiveness of various policy interventions to alleviate poverty. **Randomised controlled trial** is an experiment that is designed to isolate the influence that a certain intervention or variable has on an outcome or event.

Body:

The Randomised Control Trial (RCT) which was inspired by the use of RCTs in medical science was used by the Nobel laureates to test the effect of small interventions on the individual behaviour. The **experiment-based approach** of the laureates involved **dividing an issue into smaller and more manageable questions**. They have shown that **smaller and more precise questions are often best answered through carefully designed experiments among the people** who are the most affected. In the mid-1990s, **Dr Kremer and his colleagues** demonstrated how powerful this approach can be when they used field experiments to test a range of interventions that could improve school results in Western Kenya.

RCTs have become popular due to:

- At any point in time, there are multiple factors that work in tandem to influence various social events.
- RCTs allow economists and other social science researchers to isolate the individual impact that a certain factor alone has on the overall event.
- For instance, to measure the impact that hiring more teachers can have on children's learning, researchers must control for the effect that other factors such as intelligence, nutrition, climate, economic and social status etc., which may also influence learning outcomes to various degrees, have on the final event.
- Randomised controlled trials promise to overcome this problem through the use of randomly picked samples.
- **Many development economists** believe that RCTs can help governments to find, in a thoroughly scientific way, the most potent policy measures that could help end poverty rapidly.

Criticisms of randomised controlled trials:

- As per economist Angus Deaton, who won the economics Nobel Prize in 2015, "Understanding and misunderstanding randomised control trials" that simply choosing samples for an RCT experiment in a random manner does not really make these samples identical in their many characteristics.
- While two randomly chosen samples might turn out to be similar in some cases, he argued, there are greater chances that most samples are not really similar to each other.
- Other economists argue that social science research, including research in the field of development economics, may be inherently unsuited for such controlled research since it may be humanly impossible to control for multiple factors that may influence social events.

Conclusion:

Governments across the world spend big money on social schemes without the vaguest of ideas on whether their objectives have been met. India has been among the biggest laboratories of these experiments with several experiments on diverse themes such as literacy, nutrition, health, micro-finance and so on. The **field-work based approach** that these economists have perfected has revolutionised the field of development economics and made it more relevant in policy making. The government would do well to borrow from the research of these laureates to understand the impact of its several schemes, and where necessary, tweak them to derive maximum benefit for the thousands of crores of rupees that it spends.

Case study: For example, to study whether providing a mobile vaccination van and/or a sack of grains would incentivise villagers to vaccinate their kids under an RCT, village households would be divided into four groups.

- *Group A would be provided with a mobile vaccination van facility.*
- *Group B would be given a sack of foodgrains.*
- *Group C would get both*
- *Group D would get neither*

Group D is called the “control” group while others are called “treatment” groups. Households would be chosen on a random basis to ensure there was no bias, and that any difference in vaccination levels was essentially because of the “intervention”.

Such an experiment would not only demonstrate whether a policy initiative works but would also provide a measure of the difference it brings about. The approach would also show what happens when more than one initiatives are combined. This would help policymakers to have the evidence before they choose a policy.

Putting more money in the hands of the poor, who have a high propensity to consume, should be the aim of our fiscal policy to revive India’s ailing economy and ensure inclusive growth. Comment.(250 words)

[Livemint](#)

Introduction:

India which was hailed as the ‘**fastest growing economy**’ is now facing sluggish growth, with the Reserve Bank of India sharply cutting GDP growth forecast to 6.1% for 2019-20, which is lowest in last six years; there has been a sharp decline in the performance of key sectors. The various inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty.

Body:

Reasons for decline in Economic growth in India:

- From a peak of 8.1% in the fourth quarter of 2017-18, growth in gross domestic product (GDP) has now decelerated to a six-year low of 5% in the fiscal first quarter, with a slowdown visible across all sectors.
- Particularly important in this context is the compression of government expenditure. Central government revenue grew only 6% last year, more than 11% short of the budget estimate.
- Accordingly, expenditure growth was compressed to 6.9% last year, down from more than 11% the year before.
- Weak revenue growth meant devolution to states also fell short, forcing them to cut expenditure.
- This compression of government spending at a time when all major components of aggregate demand were already slowing has been an important driver of the sharp decline in economic growth.

Government's approach to tackle and the shortcomings:

- Given the grim global economic environment, reliance will have to be placed on internal sources to generate demand.
- The measures the government has announced are largely in response to demands of specific interest groups such as foreign portfolio investors, real estate companies, automobile companies, etc.
- These have mostly been piecemeal supply-side interventions, which may help these specific interest groups but won't reverse the collapse in aggregate demand.
- The Reserve Bank of India (RBI) has repeatedly cut the repo rate to revive demand and has also taken other measures to ease the availability of credit. With limited traction for monetary policy, the burden of growth stimulation must fall mostly on fiscal policy.
- the unrealistic assumptions of the 2019-20 budget are quite worrying. It has been assumed that tax revenue and total revenue will grow by 25.3% and 25.6%, respectively, though they both grew by only 8.9% in 2018-19. The expenditure targets are equally unrealistic. Hence, there will be another large revenue shortfall and corresponding expenditure shock this year, further reducing growth.

Measures needed:

- The impact of an increase in government spending would be direct and fast, especially if it puts more money in the hands of poor consumers who have a high propensity to consume.
- That would have a **strong multiplier effect**, and this should be the guiding principle for an inclusive fiscal strategy to revive growth.
- According to the Periodic Labour Force Survey 2017-18, 45% of regular workers are paid less than the minimum wage. The Minimum wages code would **benefit about 50 crore workers**
- Fixing the GSTN on a war footing, paring down tax exemptions and rationalizing subsidies can free up fiscal space to the tune of 6-7% of GDP.

- Building on the **PM-Kisan programme**, by extending the ₹6,000 income support per farmer to all citizens, which would cost 1% of GDP. This income support could be increased to ₹12,000 per citizen per year, doubling the cost to 2% of GDP. This support could grow with the economy.
- Education, health and infrastructure are all underfunded. Additional funding of 1% of GDP could be provided to each of these.
- Lastly, the remaining fiscal space could be used to cut the fiscal deficit.

Conclusion:

India's socialistic measures to help the poor by spending on their socio-economic challenges like Education, health, livelihood can spur the spending capacities leading to revival of economic growth. This has been substantiated by recent Economic Nobel laureates' approach of work on combating poverty through Randomised Controlled Trials.

To be a \$5-trillion economy by 2025, India needs to build a cohesive national strategy around artificial intelligence (AI), do you agree? Justify your opinion with suitable illustrations. (250 words)

Indianexpress

Why this question:

The article explains that while it is clear that India is heading in a direction where both the private and public sectors are unified in their commitment to promote and upscale AI, most of the commitments have been made on paper, in budget speeches, proposals and heavily researched reports.

Key demand of the question:

One has to explain in what way to be a \$5-trillion economy by 2025, India needs to build a cohesive national strategy around artificial intelligence (AI).

Directive:

Justify – When you are asked to justify, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question using suitable case studies or/ and examples.

Structure of the answer:

Introduction:

Explain that while the government has been vocal about its intention to mainstream AI applications for social good, and ensure that AI research in India keeps pace with global developments, there is little evidence to show that even the basic building blocks to achieve this have been put in place.

Body:

Discuss first in detail that multiple calls taken by various governmental agencies have led to seemingly independent and often confusing strategies, resulting in conflict and a very real danger of ineffective execution.

Bring out and highlight various stands taken by different institutions around this idea.

Explain what can be done.

Conclusion:

Conclude that India's AI strategy narrative needs to change from being a reactionary step to "counter the charge" of countries like China, to a proactive one where policies and infrastructure made in the country serve as "a beacon of inspiration" to other countries that are further behind.

Introduction:

The National Strategy for Artificial Intelligence published by NITI Aayog narrates the different pain points and key challenges involved in implementing Artificial Intelligence in India. It has also tried to touch upon many sectors where AI can play a significant role in bringing India to the

forefront of AI revolution. To be a \$5-trillion economy by 2025, India needs to build a cohesive national strategy around artificial intelligence (AI).

Body:

A cohesive national strategy around AI will help boost economy:

- India's digital consumer base is the world's second-largest, as well as the second-fastest growing among 17 major economies, as per findings of the latest India Economic Survey.
- And this base is core to the creation of future economic value and societal empowerment as digital solutions backed by new-gen technologies such as artificial intelligence (AI), internet of things (IoT) and automation become ubiquitous.
- The nation's naturally tech-savvy demography – 1.2 billion mobile phone connections, 560 million internet subscriptions, and over 350 million smartphones – will serve as the fulcrum of an inclusive digital transformation.
- We're already seeing more and more deployment of digital tools in the priority sectors of healthcare, education, financial services, agriculture, and transportation.
- From emboldening India's IT-BPM industry to doubling farmers' income, a strong digital economy holds the key to delivering sustainable growth, propelled by transformational innovations.
- A robust digital economy will also help India be better prepared to tackle some of the opaque complexities of the global marketplace.

However, there are conflicting views on the proposal:

- The Niti Aayog's "National Strategy for AI" report allocates a budget of Rs 7,500 crore and recommends setting up **Centers for Research Excellence (COREs)** in conjunction with academic institutions.
- It also recommends setting up **International Centers for Transformational AI (ICTAIs)** in association with leading industry players. It falls short, however, of clearly recommending the governance framework under which this should happen.
- The DIPP is next, with a budget of Rs 1,200 crore towards setting up the **National AI Mission (N-AIM)**. The N-AIM is supposed to be the nodal agency for all "AI related activities" in India which will also set up their own "centers of excellence" to promote interdisciplinary research, and assess the performance of various AI-based products in India.
- The MEITY plans to allocate a Rs 400-crore budget for new technology initiatives as part of the Digital India Programme, including working with the Digital India Corporation to set up yet another apex body for AI called the National Center for Artificial Intelligence (NCAI).
- While details on this are sparse, it has recently emerged that the ministry is at loggerheads with the Niti Aayog in terms of who ought to ultimately spearhead this movement.
- While the Union finance ministry appears to have weighed in to resolve the tussle, the final policy call on who gets to lead the charge is shrouded in controversy and uncertainty.

Measures needed:

- The government must put in place proper checks and balances against AI's misuse through legally enforceable and long-term policy guidelines, and a regulatory framework.
- By making national data centres for sensitive human data with a robust policy on data collection, use, inference, privacy, release and security, AI-based tools can enhance the growth and access to technology related to patient data and prevent misuse of personal data by private individuals, government and corporations.
- The strategy should strive to leverage AI for economic growth, social development and inclusive
- To truly harness AI's transformative potential, India must address its lack of expertise in AI research and application.
- The government must address privacy and data security concerns on a war-footing.
- India must foster AI innovations and set up AI-friendly infrastructure to prepare India's job and skill markets for AI-based future.
- Banks may look at using AI for enhancing customer experience, security, and risk management.

Way forward:

- It is important that policy-makers and agencies converge their ideas around the groundwork that has been laid to streamline the effective creation and implementation of the country's national AI strategy.
- There is also a need for greater transparency in the timelines and roadmaps associated with these announcements, so that startups, non-governmental organisations and researchers can not only provide their input, but also understand when they can use some of this promised infrastructure if they are to compete at the international level.

Conclusion:

India's AI strategy narrative needs to change from being a reactionary step to "counter the charge" of countries like China, to a proactive one where policies and infrastructure made in the country serve as "a beacon of inspiration" to other countries that are further behind. As the DIPP policy recognises, "people, process and technology" are non-negotiable for AI to proliferate in India, but in the absence of the first two, much will still left to be achieved in the third.

Small businesses hold the greatest potential for job creation, thus a policy agenda to meet India's steep employment challenges must enable them on priority. Elucidate. (250 words)

[Livemint](#)

Why this question:

The article highlights as to how we must enable small businesses to grow since these hold the greatest potential for job creation.

Key demand of the question:

Explain the background of the current economic situation in the country and bring out the role played by small businesses; discuss the positives and negatives associated.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In short set the context of the question.

Body:

Explain the following aspects in the answer body:

First discuss that India's economy has an excessive proportion of less productive, informal micro businesses.

Relate it to the employment factor in the country.

Then discuss the need for the government to recognise the impetus that small industries have to contribute to the overall growth.

Conclusion:

Conclude that there is an urgent need to recognise the significance of small businesses to the overall economic growth of the country.

Introduction:

India currently battles an economic slowdown and myriad other associated problems. The attention is thus bound to be deflected from the ever-present priority of job creation for the country's youth bulge. However, the recently released Annual Survey of Industries for 2017-18 revealed that Job creation in the factories sector has been steady, if not spectacular. The number of workers employed grew **4.8% in 2017-18**.

Body:

Potential of job creation:

- Micro, Small & Medium enterprises (MSME) termed as “**engine of growth**” for India, has played a prominent role in the development of the country in terms of creating employment opportunities.
- As per the survey, Total people engaged (including managers) rose 4.7%, the highest in four years.
- It currently employs 60 million people, creates 1.3 million jobs every year and produces more than 8000 quality products for the Indian and international markets.
- a growing body of research has upended this conventional wisdom and shown that the predominant source of job creation is firms that start small and formal, and eventually grow into medium-scale enterprises. They reveal an alternative path to generating productive jobs in India.
- Startups and young firms create more jobs regardless of their size, and educated entrepreneurs have a far higher probability of success.

The challenges and concerns associated with the growth of MSME sector:

- **Size of Sector:**
 - Micro businesses dominate most countries' economies, India's economy has an excessive proportion of less productive, informal micro businesses.

- employment in India is concentrated in these micro businesses, whereas in developed countries, it is concentrated in formal small and medium-sized firms.
- new and young firms create more jobs than older, established firms.
- with age, Indian firms typically stagnate or decline in employment.
- productive jobs are created by firms that start out as formal.
- **Access to Credit:**
 - According to Economic Survey (2017-18), MSME sector faces a major problem in terms of getting adequate credit for expansion of business activities.
 - The Survey had pointed out that the MSME received only 17.4 per cent of the total credit outstanding.
 - Most banks are reluctant to lend to MSMEs because from the perspective of bankers, inexperience of these enterprises, poor financials, lack of collaterals and infrastructure.
- **Poor Infrastructure:**
 - With poor infrastructure, MSMEs' production capacity is very low while production cost is very high.
- **Access to modern Technology:**
 - The lack of technological know-how and financial constraints limits the access to modern technology and consequently the technological adoption remains low.
- **Access to markets:**
 - MSMEs have poor access to markets. Their advertisement and sales promotion are comparatively weaker than that of the multinational companies and other big companies.
 - The ineffective advertisement and poor marketing channels makes it difficult for them to compete with large companies.
- **Legal hurdles:**
 - Getting statutory clearances related to power, environment, labour are major hurdles.
 - Laws related to the all aspects of manufacturing and service concern are very complex and compliance with these laws are difficult.
- **Lack of skilled manpower:**
 - The training and development programs in respect of MSME'S development has been. Thus, there has been a constant crunch of skilled manpower in MSMEs
 - India has a deficit of productive, job-creating entrepreneurs, and an excess of informal entrepreneurs focused on survival.
 - growing and efficient firms are founded and run by educated entrepreneurs

**Other issues:**

- Low ICT usage.
- Low market penetration.
- Quality assurance/certification.
- IPR related issues.
- Quality assurance/certification.
- Standardization of products and proper marketing channels to penetrate new markets.

Measures needed:

- The Government policies on micro, small and medium enterprises (MSMEs) must become more nuanced.
- Informal micro enterprises and single-person enterprises run by those lacking formal education should be termed “subsistence enterprises”.
- Educating the next generation is critical to breaking the iron grip of poverty and pulling single-person enterprises out of survival mode.
- Support to these subsistence enterprises should be provided under anti-poverty measures and not under an economic development programme
- To enhance the productivity of businesses and promote growth, the government should subsidise the provision of management support services—as industrial public goods—to young businesses.
- A nascent initiative in South Tamil Nadu shows that huge productivity gains are waiting to be unlocked in small businesses if entrepreneurs are made to understand the importance of some critical principles and concepts related to finance and human resources.
- Education plays a big role in the growth of startups and their contribution to employment generation, institutions of higher learning should prepare students to be entrepreneurs in the same way that they equip them with functional, marketable skills.
- The government should also periodically update the definitions of MSMEs to bring them closer to international standards. This will help ensure that businesses are not prematurely labelled as large and are not denied government support while still in need of it.

Conclusion:

Therefore, public policy to support entrepreneurship and MSMEs should target these entrepreneurs. However, any government support should be made contingent on the enterprise's progress in creating jobs and productive growth, thereby encouraging truly dynamic entrepreneurship.

As one of the fastest growing online retail markets among the economies of the world, the e-commerce sector must be assured of a fair policy framework to support India's emergence as a \$5 trillion economy by fiscal year 2024-25. Comment.(250 words)

[Livemint](#)

**Why this question:**

The article brings out the significant contributions that e-commerce in India is making and the steady trajectory of growth it has been achieving amidst economic slowdown facing the country.

Key demand of the question:

One has to elaborate on the fact that the potential of job creation in e-commerce is evident from the extent to which it has penetrated India's retail and consumption ecosystem. Explain in depth in what way e-commerce can be potentially used to create more jobs and augment the dream of \$5 trillion economy.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:**Introduction:**

In brief highlight statistics related to e-commerce in India.

Body:

Explain that the e-commerce sector's resilience indicates an increasingly sharper understanding of what both India and Bharat want.

It also must be noted that amid a perceived nationwide slowdown in consumption, India's e-commerce sector has recorded its highest sales ever.

Discuss the benefits of e-commerce.

What are the possible challenges? And how they can be addressed.

Conclusion:

Conclude by reasserting the fact that the potential of e-commerce sector must be utilized to the fullest.

Introduction:

E-commerce or Electronic commerce is a **type of business model, or segment of a larger business model, that enables a firm or individual to conduct business over an electronic network, typically the internet.** It operates in all four of the major market segments in India – **business to business, business to consumer, consumer to consumer and consumer to business.** Keeping a tab on the growing e-Commerce in India, **Ministry of Consumer Affairs** has released the **draft guidelines on e-commerce for consumer protection.** It will act as the guiding principles for e-commerce business **for preventing fraud, unfair trade practices and protecting the legitimate rights and interests of consumers.**

Body:**Status of e-Commerce in India:**

- India's e-commerce sector has grown quickly despite an uncertain policy environment.
- The e-commerce sector in India is estimated to reach USD 230 billion by 2028 (accounting for 10% of India's retail).
- The e-commerce sector in India has been witnessing an explosive growth fuelled by the increase in the number of online users, growing penetration of smartphones and the rising popularity of social media platforms.
- The Indian e-commerce industry is expected to surpass the US to become the second largest e-commerce market in the world by 2034.
- Online shoppers in India are expected to reach 120 million in 2018 and eventually 220 million by 2025.

- Even in non-traditional items such as furniture and high-end fashion labels, growth has been phenomenal.

E-Commerce and its push for \$5 trillion economy:

- e-commerce is generating sufficient value for all buyer classes, enabling it to boost consumption in a way that is both exponential and inclusive.
- The potential of job creation in e-commerce is evident from the extent to which it has penetrated India's retail and consumption ecosystem.
- e-commerce is giving equal shelf space to domestic artisans and small- and medium-sized manufacturers, granting them access to local, national and even global markets.
- As the e-commerce sector grows and deepens, its engagement with both the "classes" and the "masses" of India, so to speak, its status as a multiplier of prosperity, can only grow.
- Today, placed at the intersection of economic growth, job creation and unprecedented market access for enterprises of all sizes, the e-commerce growth story epitomizes the inclusiveness of the Indian economy set in motion by government policies.
- As it sustains its growth trajectory, e-commerce can emerge as a leading generator of jobs in areas ranging from delivery, logistics and data-analytics to product and brand experience, design and inventory management, as well as support functions such as finance, payments, legal and human resources.
- Newer and more specialised competencies, including payment gateways, big data and mobile technology are being harnessed to give consumers a hassle-free purchase experience.

Current Policy Environment:

- It is still a work in progress when it comes to safeguarding customer interest.
- Consumers are still compelled to take wild chances in online transactions.
- There is little they can do if their calls go wrong, as returns and reimbursements are risky and cumbersome.
- There are no authentic ways to figure out if product reviews, ratings or even discounts are genuine.

Measures needed to strengthen e-Commerce:

- The sector comprises a growing number of players of various sizes.
- To remain competitive, they will all have to make regular investments that would place our workforce on a par with its global counterparts, while also serving to acquire and sustain a business advantage that enables the sector to surge ahead.
- The sector's multifaceted positives and its evolving nature have led the government to adopt a consultative approach. Such consultations must continue.
- While strategically designed and implemented regulations have a place in our economy, being overly critical of a marketplace that currently serves as a beacon of commercial

success may inadvertently stifle its growth and bring back the worst of the Licence Raj regime.

Conclusion:

Given all these, the Centre should take a call soon on the e-commerce policy, balancing the priorities of the stakeholders. The draft guidelines thus propose a series of consumer safeguards in India that forbid e-commerce companies from influencing pricing, adopting unfair promotion methods or misrepresenting the quality of goods and services.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers

Discuss the need of a strong agriculture/veterinary patent regime to augment India's agricultural research and development sector, also, analyse how it can prove to be a road map for agricultural technology transfer and commercialization? (250 words)

Epw

Why this question:

The article highlights the aspects of a clear road map for agricultural technology transfer and commercialization.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate India's agricultural research and development sector scenario.

Body:

Explain that the management and transfer of agricultural technologies for commercialization purposes is considered to be a new concept in India. However, there is an upward surge in the technology protection, incubation and other commercialization activities in recent times. This can be attributed to the recent transformation of the agribusiness ecosystem in the country due to policy initiatives and more focused research in applied and frontier areas.

Discuss the various aspects, ways to augment agricultural systems, role of patents etc.

Conclusion:

Conclude that Appropriate policies should combine the concern with international norms with the specifics of India's economic and social needs to ensure the success of agricultural systems through the aid of technological advancements.

Introduction:

Technologies developed in research or academic institutions are typically transferred through an agreement in which the university or the research institution grants to a third party a licence to use its intellectual property in the defined technology, sometimes for a particular field of use and/or region of the world.

There is an upward surge in the technology protection, incubation and other commercialisation activities in recent times. This can be attributed to the recent transformation of the agribusiness ecosystem in the country due to policy initiatives and more focused research in applied and frontier areas.

**Body:****Need for a strong agriculture/veterinary patent regime:**

- The management and transfer of agricultural technologies for commercialisation purposes is considered to be a new concept in India.
- The technology transfer process promotes commercialisation, reach of better products to the market and job generation.
- The expenses incurred towards intellectual property protection and its maintenance can be justified in view of introduction of better products, increased competition in the market, enhanced customer satisfaction, and more revenue and tax generation.
- A stronger intellectual property enforcement and providing more timely resolution of infringement complaints can help combat intellectual property theft, which is not uncommon in India.
- They can forge strategic alliances with global business houses and their counterparts in foreign universities.
- In spite of the many agencies, schemes and government departments in the country that act as support mechanisms for intellectual property protection and subsequent commercialisation, the benefits have not been reaching to needy entrepreneurs, especially in the case of micro, small and medium scale agribusinesses.

Strong patent system can be a roadmap

- **Promotes Agricultural extension system:**
 - Public extension played a major role in ushering in the green revolution in Indian agriculture.
 - Though agriculture development in India is basically a state subject and the agricultural sector plays a crucial role from the perspective of ensuring food and livelihood security of its large population.
 - The central government plays a major role in formulating policies that has direct bearing on the growth of the agricultural sector.
- **Encourage public–public and public–private partnerships for intellectual property management:**
 - To increase industrial competitiveness in India, possibilities of new partnerships should be explored among the research producers, technology providers, users (including start-ups), and funders.
- **Concerted approach for promoting business incubation and start-ups:**
 - By default, agricultural technologies are low-cost technologies, and entrepreneurs consider them less enterprising because of the lower purchasing power of the target market.

- Therefore, ICAR and SAUs should initiate facilities for incubation of new business ideas based on innovative agricultural technologies by providing cheap space, facilities and required information and research inputs.
- **Bringing an act in Parliament like Bayh-Dole Act in the US:**
 - The US Bayh-Dole Act of 1980 allows universities and other non-profit institutions to have ownership rights to discoveries resulting from federally-funded research, provided certain obligations are met.
 - Crafting Indian legislation analogous to the Bayh-Dole Act in the US will ensure more legal clarity and support, lower transaction costs, and facilitate more efficient channels for technology transfer.
- **Changes in existing research ecosystem:**
 - ICAR's and SAUs's policies have to be modified in such a way that will encourage public institutions to share patent revenues with individual inventors or researchers.
 - It should also encourage universities and research institutes to patent all patentable discoveries and make it mandatory for all public research institutions to set aside a portion of royalty revenues to maintain internal systems for updating innovation, filing new patent applications, litigating, licensing, and building intellectual property awareness and competence.
- **Catalyse change in legal system and industrial culture:**
 - Apart from strengthening the institutional innovations and delivery mechanism, the NARS can also play a vital role in strengthening intellectual property laws and regulations in India with respect to agriculture, plant variety, geographical indicators, biodiversity and traditional knowledge.
 - It can also moot new guidelines for IPR policies within and outside NARS for issues related to agriculture, food and water.

Way forward:

- More concerted approaches of state and private players through effective PPPs are required to revitalise the Indian agricultural scenario to a more profit-oriented, technology savvy and productive one.
- Innovative institutional mechanisms should be designed for promoting intellectual property protection and technology commercialisation among researchers and academia.
- Legal and other supportive framework should also be strengthened to support the ever-changing intellectual property regime.
- The role of a strong intellectual property education among agricultural, business and law schools is also important in the present-day scenario.
- More open and pragmatic approaches would aid in developing a strong intellectual property platform for Indian agricultural research system.

- Forming protocols and guidelines for operating patents derived through public research funds coupled with appropriate innovations in institutional governance will enhance the prospects for technology transfer from laboratories to commercial markets.
- Appropriate policies should combine the concern with international norms with the specifics of India's economic and social needs.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

A sustainable solution for price stabilisation is the need of the hour than merely relying on ad-hoc measures. Discuss in the context of Operation Green-TOP.(250 words)

Indianexpress

Why this question:

Tomatoes-onions-potatoes (TOP) are the three basic vegetables that face extreme price volatility and the government often finds itself on the edge in fulfilling its dual objectives of ensuring remunerative prices for farmers and affordable prices for consumers. Thus necessitating us to examine the relevance of a sustainable price stabilization scheme.

Key demand of the question:

One has to explain the challenges the operation Green has come across in dealing with the issue of price stability. Explain the challenges and suggest solutions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short explain the TOP Scheme.

Body:

First discuss the key features of the current program of the government of India that seeks to address price volatility issue in agriculture system of the country.

Explain what are the possible long term solutions that can be taken forward.

Suggest sustainable solution for price stabilisation.

Conclusion:

Conclude with way ahead.

Introduction:

Operation Greens seeks to stabilize the supply of Tomato, Onion and Potato (TOP) crops and to ensure availability of TOP crops throughout the country round the year without price volatility. In the budget speech of 2018-19, a new Scheme "Operation Greens" was announced on the line of "Operation Flood", with an outlay of Rs.500 crore to promote Farmer Producers Organizations, agri-logistics, processing facilities and professional management.

Body:

Operation Green objectives:

- Price stabilisation for producers and consumers by proper production planning in TOP clusters.

- Reduction in post-harvest losses by creation of farm gate infrastructure, development of suitable agro-logistics, and creation of appropriate storage capacity linking consumption centres.
- Enhance value realisation of TOP farmers by targeted interventions to strengthen TOP production clusters and their FPOs.
- Increase in food processing capacities and value addition in TOP value chain.
- Set up of market intelligence network to collect and collate real time data on demand and supply and price of TOP crops.

Need for price stabilization of TOP crops:

- The scheme is launched on the lines of Operation Flood and seeks to replicate the success of milk in fruits and vegetables.
- Idea behind Operation Greens is to double the income of farmers by the end of 2022.
- The problem with vegetable commodities is that when their production increases sharply, their prices collapse because there is not enough modern storage capacity.
- The links between processing and organized retailing are very weak and small in India which often result in farmer receiving less than 1/4th of what consumers pay for their produce in major cities.
- Operation Greens will focus on these problems for basic ingredients and not on additional commodities in agriculture.

Challenges in implementation of Operation Green:

- There are so many varieties of TOP vegetables, grown in different climatic conditions and in different seasons, making marketing intervention (processing and storage) all the more complex, unlike in milk that is a relatively homogenous product produced round the year.
- Viable technology options for long-term storage, transport, and processing are still being developed.
- Energy intensity of available technologies, especially with rising fuel prices, poses additional challenge.
- Organized market at present is very small in relation to total production. The market has to be developed through a viable business model which is both time and cost consuming.
- The scheme has no provision for institutional setup in implementing the scheme like the National Dairy Development Board (NDDB) in Operation Flood.

Measures needed:

- There is a need to link major consumption centre to major production centre with a minimal number of intermediaries.
- Increase processing capacities for TOP. Linking the processing industry with organized retailing. On an average, about one-fourth of the produce must be processed. Budget announcement of increasing the allocation for the food processing industry by 100% is a welcome step in this regard.

- By developing forward and backward linkages, the government can ease large price fluctuations, raise farmers' share in the price paid by the consumer and at the same time, ensure lower prices for the consumers — a win-win situation for all.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management.

The recently released 20th Livestock Census report census shows that the Centre's drive to increase indigenous breeds of cattle seems to have had little impact among cattle kept for dairy purposes, in the backdrop of it analyse the success of such missions and suggest ways for improvement.(250 words)

The hindubusinessline

Why this question:

Department of Animal Husbandry & Dairying, Ministry of Fisheries, Animal Husbandry and Dairying have released the 20th Livestock Census report. The release contains some key results reflecting the aggregate counts of various species as well as its comparison with previous census.

Key demand of the question:

Explain in detail the findings of the report and evaluate the efforts of centre in this direction, present your opinion as to how far the government has been successful in achieving its defined targets.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In short highlight the importance of such a census.

Body:

The Livestock Census has been conducted in the country periodically since 1919-20.

Then discuss the findings of the report. Thereafter explain the efforts of Centre to increase indigenous breeds of cattle that seem to have had little impact among cows kept for dairy purposes. There are 4.85 crore desi (native) milch cows in the country, less than 1% increase than in the last census in 2012.

Discuss Rashtriya Gokul Mission; its objectives.

Conclusion:

Conclude with what needs to be done.

Introduction:

India's livestock sector is one of the largest in the world. About 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

Body:

| Livestock Survey, 2019 (In millions) | | | |
|---|--------------------|--------------------|---------------------|
| Animals | 2019 Survey | 2012 Survey | % difference |
| Cattle | 192.49 | 190.90 | 0.83 |
| Buffaloes | 109.85 | 108.70 | 1.00 |
| Goats | 148.88 | 135.17 | 10.10 |
| Sheep | 74.26 | 65.06 | 14.10 |
| Pigs | 9.06 | 10.29 | -12.03 |
| Poultry | 851.81 | 729.2 | 16.80 |
| Total | 535.78 | 512.06 | 4.60 |

Trends in livestock population: (Source: 20th Livestock Census)

- Total Livestock population is 535.78 million- an increase of 4.6% over Livestock Census-2012.
- Total Bovine population (Cattle, Buffalo, Mithun and Yak)-79 Million in 2019- an increase of about 1% over the previous census.
- A **decline of 6 % in the total Indigenous/ Non-descript cattle** population over the previous census.
- The population of cows in the country has risen by 18 per cent in the last seven years, while that of oxen dipped by 30 per cent, according to the latest census of livestock.
- there was a spectacular 16.8 per cent increase in the poultry population in the country to 851.81 million, mainly on account of a 46 per cent rise in backyard poultry birds, whose numbers have gone up to 317 million.
- The number of female cattle is 145.12 million, which is 18 per cent over the 122.98 million in 2012. The number of male cattle, on the other hand, dropped to 47.4 million as against 67.92 million in 2012.
- While cattle accounted for 35.94 per cent of total livestock in the country, goats accounted for 27.80 per cent, buffaloes: 20.45 per cent, sheep: 13.87 per cent and pigs: 1.69 per cent.

Challenges faced by Livestock sector in India:

- Livestock sector did not receive the policy and financial attention it deserved. The sector received only about 12% of the total public expenditure on agriculture and allied sectors, which is disproportionately lesser than its contribution to agricultural GDP.
- The sector has been neglected by the financial institutions.
 - The share of livestock in the total agricultural credit has hardly ever exceeded 4% in the total (short-term, medium-term and long-term). The institutional mechanisms to protect animals against risk are not strong enough.

- **Insurance:**
 - Currently, only 6% of the animal heads (excluding poultry) are provided insurance cover. Livestock extension has remained grossly neglected in the past.
 - Only about 5% of the farm households in India access information on livestock technology. These indicate an apathetic outreach of the financial and information delivery systems.
- **Lack of access to markets** may act as a disincentive to farmers to adopt improved technologies and quality inputs.
- **Productivity:**
 - Improving productivity of farm animals is one of the major challenges. The average annual milk yield of Indian cattle is 1172 kg which is only about 50% of the global average.
- **Diseases:**
 - The Frequent outbreaks of diseases like Food and Mouth Diseases, Black Quarter infection, Influenza etc. continue to affect Livestock health and lower the productivity.
- **Environment:**
 - India's huge population of ruminants contributes to greenhouse gases emission adding to global warming. Reducing greenhouse gases through mitigation and adaptation strategies will be a major challenge.
- **Crossbreeding of indigenous species** with exotic stocks to enhance genetic potential of different species has been successful only to a limited extent.
- **Limited Artificial Insemination services** owing to a deficiency in quality germplasm, infrastructure and technical manpower coupled with poor conception rate following artificial insemination have been the major impediments.
- Livestock derives a major part of their energy requirement from agricultural by-products and residues. Hardly 5% of the cropped area is utilized to grow fodder. India is deficit in dry fodder by 11%, green fodder by 35% and concentrates feed by 28%. The common grazing lands too have been deteriorating quantitatively and qualitatively.
- Except for poultry products and to some extent for milk, markets for livestock and livestock products are underdeveloped, irregular, uncertain and lack transparency. Further, these are often dominated by informal market intermediaries who exploit the producers.
- Likewise, **slaughtering facilities are too inadequate**. About half of the total meat production comes from un-registered, make-shift slaughterhouses. Marketing and transaction costs of livestock products are high taking 15-20% of the sale price.

Measures needed:

- A national breeding policy is needed to upgrade the best performing indigenous breeds.

- Buffalo breeding ought to be given more attention, while poultry breeding should be focused on conservation.
- State governments should be encouraged to participate in national breeding policy implementation. Geographical information system-based analysis must be utilised to map production systems.
- Animal health care should become a priority, with greater investment in preventive health care.
- Private investment must also be encouraged. The government needs to create better incentive structures for investment in livestock.
- State governments should sponsor research and assessment of the market, along with highlighting investment potential.

Conclusion:

With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario. Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society. Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

Food Corporation of India's rising debt stock is an alarming concern; discuss in detail the causative factors of the same while suggesting suitable measures to address the issues. (250 words)

Reference**Introduction:**

Food Corporation of India (FCI) was formed in 1960's and was part of larger plan directed toward food security and self-sufficiency. Other major institution was CACP. These two institutions along with MSP regime and Public distribution system were expected to work in tandem. FCI's responsibility was to procure, Store and discharge grains as per policy of the government. Over the time, as in other cases these institutions too failed to adapt to changing circumstances such as changing demands of economy. As a result, FCI now reels under chronic inefficiency through huge wastages, and storage cost of grains keeps on cumulating.

Body:

In the last five years, Food Corporation of India has seen its debt level magnifying from ₹91,409 crores to ₹2.65 lakh crore in March 2019 — an increase of over 190 per cent.

Causative factors for the same:

- FCI, responsible for overseeing the National Food Security Act, does not have any stream of income of its own.
- The debt levels went starkly up in 2016-17, because the government decided to start giving credit to the FCI from the National Small Savings Fund (NSSF) to fuse the gap between what the government should have provided for in the fiscal budget and what it could actually disburse due to its budgetary constraints.
- FCI is completely dependent for revenue on the Centre. The Centre is responsible to fix the minimum support price for buying the foodgrains from the farmers, as well as the issue price which is the price at which they are supplied to the states.
- This difference, along with the cost of distribution, are paid by the government to FCI in the form of food subsidy.
- The last few years have seen the government increasingly budget a reduced amount than what is required as food subsidy. To recompense for the shortfall, the FCI has been borrowing from the NSSF every year.
- The passing of the National Food Security Act, 2013, augmented the number of beneficiaries while dipping the sale price of rice and wheat.
- At the same time, procurement prices have been rising heavily with higher minimum support prices and rising procurement by the FCI.
- The FCI buys high and sells low, managing on subsidies paid by the government. India's food subsidy bill has risen rapidly, doubling in six years (Rs 1.7 lakh crore in financial year 2018-19, or 0.9 per cent of GDP).

The government had set up a **six-member committee under Shanta Kumar** to suggest restructuring or unbundling of FCI to improve its financial management and operational efficiency in procurement, storage and distribution of food grains.

Important recommendations made:

- Reduce the number of beneficiaries under the Food Security Act—from the current 67 per cent to 40 per cent.
- Allow private players to procure and store food grains.
- Stop bonuses on minimum support price (MSP) paid by states to farmers, and adopt cash transfer system so that MSP and food subsidy amounts can be directly transferred to the accounts of farmers and food security beneficiaries.
- FCI should involve itself in full-fledged grains procurement only in those states which are poor in procurement. In the case of those states which are performing well, like Haryana, Punjab, Andhra Pradesh, Chhattisgarh, Madhya Pradesh and Odisha, the states should do the procurement.
- Abolishing levy rice: Under levy rice policy, government buys certain percentage of rice (varies from 25 to 75 per cent in states) from the mills compulsorily, which is called levy rice. Mills are allowed to sell only the remainder in the open market.
- Deregulate fertiliser sector and provide cash fertiliser subsidy of Rs 7,000 per hectare to farmers.
- Outsource of stocking of grains: The committee calls for setting up of negotiable warehouse receipt (NWR) system. In the new system, farmers can deposit their produce in these registered warehouses and get 80 per cent of the advance from bank against their produce on the basis of MSP.
- Clear and transparent liquidation policy for buffer stock: FCI should be given greater flexibility in doing business; it should offload surplus stock in open market or export, as per need.

Government has taken up few of the reforms as follows:

- **Aadhaar Linked and digitized ration cards:** This allows online entry and verification of beneficiary data. It also enables online tracking of monthly entitlements and off-take of foodgrains by beneficiaries.
- **Computerized Fair Price Shops:** FPS automated by installing 'Point of Sale' device to swap the ration card. It authenticates the beneficiaries and records the quantity of subsidized grains given to a family.
- **Direct Benefit Transfer:** Under the Direct Benefit Transfer scheme, cash is transferred to the beneficiaries' account in lieu of foodgrains subsidy component. They will be free to buy food grains from anywhere in the market. For taking up this model, pre-requisites for the States/UTs would be to complete digitization of beneficiary data and seed Aadhaar and bank account details of beneficiaries. It is estimated that cash transfers alone could save the exchequer Rs. 30,000 crores every year.
- **Use of GPS technology:** Use of Global Positioning System (GPS) technology to track the movement of trucks carrying food grains from state depots to FPS which can help to prevent diversion.

- **SMS-based monitoring:** Allows monitoring by citizens so they can register their mobile numbers and send/receive SMS alerts during dispatch and arrival of TPDS commodities
- **Use of web-based citizens' portal:** Public Grievance Redressal Machineries, such as a toll-free number for call centres to register complaints or suggestions.

Government has come up with a **roadmap** with the following highlights:

- Primacy will be given to ensuring that the functioning of FCI is streamlined and fast paced as per recommendations of the **Shanta Kumar Committee**.
- 100 lakh ton silo storage capacity will be created in the country. For this, RITES has been assigned the task of changing the silo model and they will give their recommendations in 90 days to FCI.
- At present, there are 3 types of labourers in FCI namely Departmental, Daily Payment System (DPS) and No work no pay workers along with contractual labour. Government of India is deliberating to finish the 3 different arrangements and bring all workers of FCI under a single, uniform system which will bring stability of tenure and secured wages for all.
- To improve the usage of Information Technology in FCI, a Human Resource Management System (HRMS) will be implemented, the work for which will begin in August, 2019 and will be completed by August 2020. This move will benefit 22,000 employees in 196 offices of FCI.

Conclusion:

The Committee recommendations however was criticized due to suggestions like limiting NFSA, cash subsidy, privatization of FCI despite suggesting useful reforms to reform FCI, PDS. A closer scrutiny in the recommendation is needed today in times of agricultural distress & drought prone years.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

“Prevention is better than cure”. Appreciate the statement in the context of fighting disasters. Also, discuss the role that the Coalition for Disaster Resilient Infrastructure can play in addressing this aspect.(250 words)

[Indianexpress](#)

Introduction:

The **Coalition for Disaster Resilient Infrastructure (CDRI)**, as proposed by Indian Prime Minister, will act as a **convening body that will pool best practices and resources from around the world for reshaping construction, transportation, energy, telecommunication and water, so that building in these core infrastructure sectors factors in natural catastrophes.**

Body:

Need for CDRI:

- According to Sendai framework, every \$1 spent in disaster risk reduction leads to gain of \$7. But developing countries face the dilemma of balancing economic investment for development vs disaster resilient infrastructure.

- CDRI could fill this gap of funds and technology and help developing countries to build disaster-resilient Infrastructure.
- Suppose a disaster strikes a country, the affected nation could approach CDRI for technical and financial help, thus shielding it from excessive damage and devastation.
- **Post-calamity resuscitation and reconstruction** to strengthen local infrastructure and soften the blow of the next disaster, is a farsighted approach.
- It can only work if there is domestic political will, which is reinforced at the multilateral level through CDRI.
- CDRI is an attempt to bring countries together to share and learn from the experiences of one another to protect their key infrastructure — highways, railways, power stations, communication lines, water channels, even housing — against disasters.

Role of CDRI:

- To make entire networks of modern infrastructure resilient is the main thought behind the Indian initiative of CDRI.
- The platform is not meant to plan or execute infrastructure projects. Nor is it an agency that will finance infrastructure projects in member countries. Instead, CDRI will seek to identify and promote best practices, provide access to capacity building, and work towards standardisation of designs, processes and regulations relating to infrastructure creation and management.
- It would also attempt to identify and estimate the risks to, and from, large infrastructure in the event of different kinds of disasters in member countries.
- CDRI hopes to have as its members not just countries, but organisations like UN bodies, financial institutions, and other groups working on disaster management.
- It seeks to help member countries integrate disaster management policies in all their activities, set up institutions and regulatory provisions to ensure creation of resilient infrastructure, and identify and use affordable finance and technology.

Significance of CDRI:

- CDRI will benefit all sections of society.
- Economically weaker sections of society, women and children, are the most vulnerable to the impacts of disasters and hence, will be benefitted from the improvement of knowledge and practice in creating disaster resilient infrastructure.
- It will also benefit all areas with high disaster risk.
- In India, the north-eastern and Himalayan regions are prone to earthquakes, coastal areas to cyclones and tsunamis and central peninsular region to droughts.
- The CDRI secretariat too would be based in New Delhi. While it is not envisioned to take the shape of a treaty-based organisation, CDRI can be seen as complementing International Solar Alliance's efforts.

- ISA is about climate change mitigation — deployment of more solar energy would bring down the reliance on fossil fuels, thereby reducing greenhouse gas emissions. CDRI, on the other hand, is about adapting to climate change, a need that is inevitable.

Case Studies:

- Japan is prone to recurrent killer earthquakes, tsunamis and typhoons, but it has overcome these liabilities through improved building rules, stricter zoning laws and regulations since the 1980s, making it the world's safest and most disaster-resilient country.
- In Latin America, Chile has similarly learnt lessons from past catastrophes and drastically cut down casualties and losses from disasters through well-regulated building standards.

Conclusion:

Each time a natural disaster occurs anywhere in the world, countries try to provide immediate relief, but there is no focus on building disaster-resilient Infrastructure. CDRI would help fill this gap and India can play a crucial role in setting a global example. With ISA and CDRI, India is seeking to obtain a leadership role, globally, in matters related to climate change.

Discuss the Renewable energy generation capacity of India. What would be a cost-effective way to enhance the renewable energy generation capacity of India? Elaborate. (250 words)

The hindu

Why this question:

The article throws light upon the methods of enhancing cost effective renewable energy generation to augment the capacity of Indian renewable energy sector.

Key demand of the question:

One has to briefly present the Indian renewable energy scenario and explain some of the key cost-effective ways to enhance the renewable energy generation capacity of India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start by stating facts – India aims to have a renewables capacity of 175 GW by 2022 and 500 GW by 2030. The editorial analyses how India can achieve these targets in a cost-effective manner.

Body:

First explain Renewable energy generation capacity of India with relevant facts and details such as – currently installed capacity of 358 GW is about four times of what it was in 1997-98, which shows a doubling of capacity in each of the past two decades — or about 75 MW per day. By India's historical standards, these are astonishing numbers.

Then move onto discuss what the concerns are therein.

Explain What would be a cost-effective way to enhance the renewable energy generation capacity of India?

Conclusion:

Conclude with way ahead.

Introduction:

India has been aggressively expanding its power generation capacity. **Today's installed capacity of 358 GW** is about four times of what it was in 1997-98, which shows a **doubling of capacity in each of**

the past two decades — or about 75 MW per day. The **private sector accounts for almost half the installed generation capacity**. For the last three years, growth in generation from renewables has been close to 25%. India aims to have a renewables capacity of 175 GW by 2022 and 500 GW by 2030. **Solar and wind power plants** would account for much of the targeted capacity from renewables.

Body:

Powering India
The major growth drivers have been renewable energy sources such as solar and wind power, and private sector investment.

Table 1: Power plants: average capacity and average cost

| Plant Type | Average capacity (MW) | Average Cost / MW (₹ crore) |
|------------|-----------------------|-----------------------------|
| Thermal | 741 | 7.50 |
| Solar | 39 | 9.38 |
| Wind | 44 | 7.06 |
| Hydel | 112 | 12.01 |

Table 2: Comparison of public and private capacity costs (1997 - 2017)

| Plant Type | Average cost (₹ crore/ MW) | | Average Capacity (MW) | |
|------------|----------------------------|---------|-----------------------|---------|
| | Public | Private | Public | Private |
| Thermal | 7.9 | 6.8 | 721 | 748 |
| Solar | 8.1 | 11.4 | 82 | 37 |
| Wind | 7.7 | 6.8 | 36 | 46 |
| Hydel | 12.2 | 8.0 | 223 | 29 |

Table 3: Reducing costs of power capacity (1997 - 2017)

| Plant Type | Average cost / MW (₹ crore) | | Average plant capacity | | Percentage fall in costs | Percentage change in capacity |
|------------|-----------------------------|------------|------------------------|------------|--------------------------|-------------------------------|
| | Before 2013 | After 2013 | Before 2013 | After 2013 | | |
| Thermal | 8.3 | 6.6 | 561.0 | 676.0 | -21% | 20% |
| Solar | 11.3 | 8.4 | 30.0 | 51.0 | -25% | 70% |
| Wind | 7.4 | 6.6 | 42.0 | 44.0 | -11% | 5% |
| Hydel | 14.5 | 7.7 | 141.0 | 279.0 | -47% | 98% |

(Note: All costs are calculated for 2017 values)

Cost-effective way to enhance the renewable energy capacity:

- **Increasing accessibility to clean energy:**
 - India has already committed to bring electricity to every household by 2022. An even more ambitious goal would be to provide electricity to all households on 24x7 basis.
 - To bring clean fuel in rural areas the Pradhan Mantri Ujjawala Yojana, should be complemented by: Setting up of biomass pelletising units; and distribution of 'efficient biomass chullahs'.
 - On the agricultural front, solar irrigation pump distribution target must be stepped up and financed through credit support from NABARD and government subsidy.
 - The potential non-conventional energy sources must be explored and researched to make them technologically economical and accessible, like geothermal energy, tidal energy etc.
- **Enhancing efficiency:**
 - The National Mission for Enhanced Energy Efficiency (NMEEE) should conduct a thorough cost-benefit analysis of the available energy-efficient technologies and products across all sectors, especially agriculture, housing and transportation.

- At the institutional level, the national and state designated agencies working in the area of energy efficiency should be strengthened.
- To enhance vehicle fuel efficiency gains, the auto fuel quality should be upgraded to BS VI norms for nation-wide launch in 2020.
- **Policy changes:**
 - Around three-quarters of our power comes from coal powered plants. It is important that India increases its domestic coal to reduce its dependence on imports.
 - There is need to fast track the regulatory clearances, improve labour productivity, increase coal production and enhance efficiency of distribution.
 - **Hydrocarbon Exploration and Licensing Policy (HELP)** intends to minimize government's discretion in decision making, reduce disputes, reduce administrative delays and introduce concept of revenue sharing, freedom of marketing to stimulate growth in the oil and gas sector in India.
 - **The tax structure** should be rationalized in import and sale of energy on thermal value basis with a view to enhance the competitiveness of the economy.
 - **The India energy security scenarios, 2047 (IESS)** has been developed as an energy scenario building tool. The guiding ambition of this is to develop energy pathways leading up to the year 2047, comprising of likely energy demand and supply scenarios.
 - NITI Aayog launched the India Energy Security Scenarios 2047 calculator (IESS 2047), as an open source web based tool.
 - The tool aims to explore a range of potential future energy scenarios for India, for diverse energy demand and supply sectors leading up to 2047.
- **Infrastructure:**
 - Refining and distribution of oil and gas needs augmentation. Thus, India should sustain its export capacity of refined products by setting up new refineries.
 - At present, 31 companies are developing City Gas Distribution (CGD) networks in 21 states for transportation or distribution of natural gas to consumers in domestic, commercial or industrial and transport sectors through a network of pipelines.
 - For the hydro projects, the government will need to make efforts to expedite progress on capacity under construction through satisfactory Rehabilitation & Resettlement implementation.
 - India has also built its **strategic petroleum reserves** in order to meet any supply shocks due to any external exigencies like wars, natural disasters etc. Indian Strategic Petroleum Reserves Ltd, a special purpose vehicle under the Oil and Gas Ministry, has constructed three strategic petroleum reserves in huge underground rock caverns at Visakhapatnam on the East Coast, and at Mangaluru and Padur on the West Coast.
 - These facilities, with total capacity of 5.33 million tonnes, can meet about 10 days of India's crude oil requirements. India now plans to build another 6.5 million tonnes of storage at Padur and Chandikhole in Odisha which will augment its supply to 22 days.

- **India's Energy diplomacy:**
 - India is setting up a web of energy relationships in the extended neighborhood covering Myanmar, Vietnam in the east, with Central Asian countries like Kazakhstan and Gulf countries in the west.
 - Indo-US Nuclear deal opened new vistas for India in field of Nuclear energy facilitating cutting edge technology and nuclear fuel. India has started to engage with China, Kazakhstan and Australia for nuclear fuel.
 - India's SCO membership could now play a bigger role in ensuring greater energy cooperation between energy producers and consumers by linking Central Asia and South Asia.
- **Promotion of Renewable Energy:**
 - A renewable energy capacity of 100 GW should be achieved by 2019-20 so as to contribute to achievement of 175 GW target by 2022.
 - Solar Energy Corporation of India Limited (SECI) should develop storage solutions within next three years to help bring down prices through demand aggregation of both household and grid scale batteries.
 - A large programme should be launched to tap at least 50% of the bio-gas potential in the country by supporting technology and credit support through NABARD by 2020.

Conclusion

Major transformations are underway in global energy sector, from growing electrification to the expansion of renewable energy, upheavals in oil production and globalization of natural gas markets. India needs to build its capacity in research and skills building to deal with these transformations in energy sector. India needs to ensure long term planning to ensure universal energy access and meeting its commitment under Paris Agreement to ensure sustainable and inclusive growth.

Energy efficiency is the foundation of a strong, self-sufficient, and sustainable economy.

Comment.(250 words)

[Hindustantimes](#)

Why this question:

The article highlights the achievements of SLNP program and its contributions to energy saving efforts of the GOI.

Key demand of the question:

One has to discuss the significance of energy efficiency, in what way it can be achieved.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief explain what energy efficiency is.

Body:

First highlight that through nationwide initiatives promoting the affordability of energy efficiency solutions, the government has showcased its strong commitment to the fundamentals of sustainability. Then explain what measures are yet to be taken.

Discuss various methods to bring in and achieve the vision of energy efficiency.

**Conclusion:**

Conclude with way forward.

Introduction:

Energy efficiency simply means using less energy to perform the same task – that is, eliminating energy waste. Energy efficiency brings a variety of benefits: reducing greenhouse gas emissions, reducing demand for energy imports, and lowering our costs on a household and economy-wide level. For example, a compact fluorescent bulb is more efficient than a traditional incandescent bulb as it uses much less electrical energy to produce the same amount of light. Similarly, an efficient boiler takes less fuel to heat a home to a given temperature than a less efficient model.

Body:**Street Lighting National Programme (SLNP): a good example of energy efficient practice**

- The installation and retrofitting of energy-efficient LED streetlights under SLNP has crossed one crore.
- The initiative has enabled annual energy savings of 6.71 billion kwh reducing 4.63 million tonnes of CO2 emissions.
- The resultant energy savings have enabled the country to free up 1,119.40 MW of capacity during peak hours.
- Moreover, these energy-efficient street lights have illuminated 270,000 km of roads in India and generated 13,000 employment opportunities.
- Further, from various surveys carried out to find the satisfaction level of citizens, it is found that about 99% of the respondents feel more comfortable with the new LED installation.
- They also feel that there has been significant improvement regarding safety and business activities.
- Owing to the energy-efficient LED lights, the visibility on roads has improved significantly instilling a sense of safety among citizens.
- These smart LEDs installed under SLNP can be monitored and operated remotely through a central control and monitoring system.
- The government recognises the importance of energy efficiency and milestones like these reinforce my confidence that we will achieve our climate commitments before the targeted deadline.

India's energy efficiency initiatives:

- **Intended Nationally Determined Contribution (INDC):**
 - India has expressed a strong resolve to work towards low carbon emissions, while simultaneously achieving all developmental targets. We aim to reduce the emission intensity of GDP by 33 to 35% by 2030.
 - To protect the poor and vulnerable from the adverse impacts of climate change, it is an imperative that the world adopts a sustainable lifestyle.

- India's INDC proposal also highlights the need for a sustainable lifestyle as one of the integral solutions to climate change.
- The **National Mission for Enhanced Energy Efficiency (NMEEE)** seeks to achieve a total avoided capacity addition of 19,598 MW, annual fuel savings of around 23 million tonne and reduction in greenhouse gas emissions by 98.55 million tonne per year at its full implementation.

Way forward:

- The standards and labelling programme provide the consumer an informed choice about energy saving and thereby the cost saving potential of the products.
- We are also building capacity of discoms to help them reduce peak electricity demand.
- To incentivise efficiency in energy-intensive industries, we have launched a market-based mechanism called Perform Achieve and Trade scheme which allows trading of energy-saving certificates.
- Electric vehicles and chargers have penetrated almost every state, and smart metres are rapidly making headway into homes.

Conclusion:

Through nationwide initiatives promoting the affordability of energy efficiency solutions, the government has showcased its strong commitment to the fundamentals of sustainability. Our ultimate purpose is to promote energy efficiency as a way of life for every Indian. This vision is aligned with our commitments made under the Paris Agreement.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

India is preparing for a massive digital and technological transformation; in such a phase discuss India's preparedness with respect to embracing Industrial Revolution 4.0.(250 words)

[Timesofindia](https://timesofindia.com)

Why this question:

Recently, A pilot project for ushering in Industry 4.0 in the country has been launched at the Modern Coach Factory in Uttar Pradesh's Raebareli.

Key demand of the question:

The question seeks to discuss the relevance and progress of Industrial revolution 4.0 for Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define Industrial revolution 4.0. – The fourth Industrial Revolution describes the present technological age ongoing in 21st century that has come up since the first such revolution took place in the 18th century.

**Body:**

Explain the context of India and its progress on IR 4.0.

India has become the fourth country in the world where World Economic Forum has opened its centre for Fourth Industrial Revolution.

Hence, India is preparing for a massive digital and technological transformation.

The centre for Fourth Industrial Revolution works as a network that includes USA, China and Japan.

The centre would be based in Maharashtra and it has selected drones, artificial intelligence and block chain as the first three project areas.

NITI Aayog will coordinate the partnership on behalf of the government and the work of the centre among multiple ministries.

Conclusion:

Conclude with way forward.

Introduction:

The **fourth Industrial Revolution** describes the present technological age ongoing in 21st century that has come up since the first such revolution took place in 18th century. Industry 4.0 is a **complex cyber-physical system** which synergies production with **digital technologies, Artificial Intelligence, Big Data, Analytics, Machine Learning and Cloud computing**. A pilot project for ushering in Industry 4.0 in the country has been launched at the Modern Coach Factory in Uttar Pradesh's Rae Bareilly district.

Body:

Industrial Revolution 4.0 can help in transforming India by:

- Alleviating poverty
- Better and low-cost healthcare
- Enhancing farmer's income
- Providing new technology and equipment to farmers
- Strengthening infrastructure, improving connectivity
- Improve ease of living and ease of doing business

India's preparedness to embrace IR 4.0:

- India has become the fourth country in the world where **World Economic Forum** has opened its centre for Fourth Industrial Revolution. Hence, India is preparing for a massive digital and technological transformation.
- The centre for Fourth Industrial Revolution works as a network that includes USA, China and Japan.
- The centre would be based in Maharashtra and it has selected drones, artificial intelligence and block chain as the first three project areas.
- NITI Aayog will coordinate the partnership on behalf of the government and the work of the centre among multiple ministries.
- The Department of Science and Technology has recently launched a **programme 'Intermediary Cyber Physical Systems' (ICPS)** to foster and promote R&D in AI.

- Google at the fifth edition of its annual Google for India event announced that it is setting up a research lab focused on artificial intelligence (AI) and its applications in India. The company's AI lab — **Google Research India** — is based in Bengaluru
- The NITI Aayog has drawn up a plan for creating an institutional framework for artificial intelligence (AI) in the country. It has circulated a cabinet note to provide Rs 7,500 crore in funding for creation of cloud computing platform called AIRAWAT and research institutes.
- A national artificial intelligence (AI) programme, will see the formation of a task force under Principal Scientific Advisor K Vijay Raghavan to identify projects and initiatives in which to implement the AI technology.
- The policy will also include a national artificial intelligence centre on which will be the department that will anchor the project.
- The proposed policy and the centre could finally see the light of day as the finance ministry has cleared the NITI Aayog's Rs 7,500-crore plan.

Conclusion:

Schemes like Skill India, Startup India, Atal Innovation Mission and Digital India are developing youths to use new technologies. India's diversity, demographic potential, fast growing market size and digital infrastructure have the potential to make India a global hub for Research and Development.

Lithium-ion batteries are the edifice of the wireless technology revolution. In this context discuss their significance and challenges facing these rechargeable Lithium Batteries. (250 words)

The hindu

Why this question:

The article discusses in detail the coming of Li-ion batteries and in what way they have set off a technology revolution. The 2019 Nobel Prize for Chemistry was awarded to John B. Goodenough, M. Stanley Whittingham and Akira Yoshino for working towards the development of practical lithium-ion batteries, thus making it important from exam point of view.

Key demand of the question:

One has to explain in detail the technological revolution that Li-Ion batteries have brought in and the importance of the same with challenges.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First explain the coming of Li-ion batteries.

Body:

Explain first why Li-ion batteries are important?

Discuss the genesis of the same.

Explain that For many years, nickel-cadmium had been the only suitable battery for portable equipment from wireless communications to mobile computing. Nickel-metal-hydride and lithium-ion emerged In the early 1990s, fighting nose-to-nose to gain customer's acceptance. Today, lithium-ion is the fastest growing and most promising battery chemistry.

List down the advantages and limitations of the same.

Conclusion:

Conclude with way forward.

Introduction:

Lithium-ion batteries are the edifice of the wireless technology revolution that made possible portable compact disc players, digital wrist watches, laptops and the mobile phones of today. It is also seen as important to a fossil-free future of electric cars that governments envisage to address climate change. The **2019 Nobel Prize for Chemistry** was awarded to **John B. Goodenough, M. Stanley Whittingham and Akira Yoshino** for working towards the development of practical lithium-ion batteries.

Body:

Lithium Ion Battery:

- It is type of **rechargeable battery** that contains several cells.
- Each cell consists of cathode, anode and electrolyte, separator between electrodes and current collectors. Li-ion battery use **intercalated lithium compound** as one electrode material.
- When the battery is **charging up**, the **lithium-cobalt oxide**, positive electrode gives up some of its lithium ions, which move through the electrolyte to the negative, graphite electrode and remain there.
- When the battery is **discharging**, the lithium ions move back across the electrolyte to the positive electrode, producing the energy that powers the battery.

Advantages:

- Li-ion batteries are rechargeable (lifecycle of 5000 recharges), highly space efficient, light-weight and low-maintenance vis-à-vis lead acid batteries.
- **High energy density:** The much higher power density offered by lithium ion batteries is a distinct advantage.
- Rate of self-discharge is much lower than that of other rechargeable cells such as Ni-Cad and NiMH forms.
- It can provide instant torque to the electric motor and maintain constant voltage throughout entire discharge cycle.
- Clean and safe technology vis-à-vis fossil fuels.

Challenges:

- Raw materials are concentrated only in few places on earth. **Example:** Afghanistan, China etc.
- They are not as robust as some other rechargeable technologies and require long durations for charging.
- They require **protection circuitry** incorporated to ensure they are kept within their safe operating limits.
- Typically they are around 40% more costly to manufacture than Nickel cadmium cells.

**Conclusion:**

India is **one of the largest importers** and in 2017, it imported nearly 150 Million US Dollar worth Li-Ion batteries. Indian manufacturers source Lithium Ion Battery from China, Japan and South Korea among some other countries. The Lithium Ion batteries currently score over the Hydrogen Fuel cells due to the former's wide applications from mobile phones to wearable devices to e-Vehicles. The **FAME India** is a part of the **National Electric Mobility Mission Plan** whose main thrust is to **encourage electric vehicles by providing subsidies**. India must however make a concerted attempt to incentivize both EVs and FCEVs.

Technological solutions to combat environment challenges might not be the best mode of action. Do you agree? Discuss with suitable illustrations. (250 words)

The hindu

Introduction:

The climate change and environmental degradation has posed some grave threats to the environment. According to **UN Water**, some 1.1 billion people worldwide lack access to water, and a total of 2.7 billion find water scarce for at least one month of the year. The recent **IPCC's "Special Report on Global Warming of 1.5°C"** revealed that the impacts and costs of 1.5 degrees Celsius of global warming will be far greater than expected. The Intergovernmental Panel on Climate Change says a **1.5°C average rise may put 20-30% of species at risk of extinction**. If the **planet warms by more than 2°C, most ecosystems will struggle**. Coral reefs are projected to **decline by a further 70-90% at 1.5°C**.

Body:

A number of technological solutions are at place to mitigate the effects of climate change. These technologies have helped humankind to find solutions to the problems posed by the climate change. However, in a world where climate change, air and water pollution, biodiversity loss, water scarcity, ozone depletion, and other environmental problems overlap, a fix in one arena can cause trouble or pose challenges in another.

- **Transport technologies:** Like Metro, pods, high speed rail which help in mass movement of the people from point to point.
- **Challenges posed:** In Mumbai, despite a sustained and widespread citizens' campaign, the Aarey forest has been chopped down. Despite a number of alternative available sites for the Metro car depot, the agency has remained stubborn on the forest land. The push for the capital-intensive Metro has come at a time when the city's bus service is in tatters. Building a Metro will prevent an increase in emissions.
- **Desalination technology:** Desalination has become a solution for many cities located in coastal areas. The saline water from the sea is treated and the water is made potable. More than 16,000 desalination plants are scattered across the globe producing fresh water, according to a **first global assessment of the sector's industrial waste**.
- **Challenges posed:** The plants produce more briny toxic sludge than fresh water. For every litre of fresh water extracted, a litre-and-a-half of salty, chemical-laden sludge called brine is dumped—in most cases—into the ocean. That's enough to cover the state of Florida in a 30-centimetre (one-foot) layer of slime.
